

# OMAP35x Applications Processor

## Texas Instruments OMAP™ Family of Products

# Technical Reference Manual

Literature Number: SPRUF98D  
October 2009

<b>1</b>	<b>Introduction .....</b>	<b>153</b>
1.1	Overview .....	154
1.1.1	OneDRAM Implementation .....	155
1.2	Environment .....	156
1.3	Description .....	157
1.3.1	MPU Subsystem .....	158
1.3.2	IVA2.2 Subsystem .....	158
1.3.3	On-Chip Memory .....	159
1.3.4	External Memory Interfaces .....	159
1.3.5	DMA Controllers .....	160
1.3.6	Multimedia Accelerators .....	160
1.3.7	Security (HS Devices Only) .....	161
1.3.8	Comprehensive Power Management .....	161
1.3.9	Peripherals .....	161
1.4	Package-On-Package Concept .....	163
1.5	OMAP35x Family .....	165
1.5.1	Device Features .....	165
1.5.2	Device Identification .....	167
1.5.2.1	720MHz Device Identification .....	171
1.5.2.1.1	Procedure for Calculation of SmartReflex nValue for OPP6 .....	171
1.5.3	General Recommendations Relative to Unavailable Features/Modules .....	171
1.6	Revision History .....	173
<b>2</b>	<b>Memory Mapping .....</b>	<b>175</b>
2.1	Introduction .....	176
2.2	Global Memory Space Mapping .....	178
2.3	L3 and L4 Memory Space Mapping .....	181
2.3.1	L3 Memory Space Mapping .....	181
2.3.2	L4 Memory Space Mapping .....	182
2.3.2.1	L4-Core Memory Space Mapping .....	182
2.3.2.2	L4-Wakeup Memory Space Mapping .....	185
2.3.2.3	L4-Peripheral Memory Space Mapping .....	186
2.3.2.4	L4-Emulation Memory Space Mapping .....	187
2.3.3	Register Access Restrictions .....	188
2.4	IVA2.2 Subsystem Memory Space Mapping .....	189
2.4.1	IVA2.2 Subsystem Internal Memories and Cache Allocation .....	190
2.4.1.1	IVA2.2 Subsystem Memory Hierarchy .....	190
2.4.1.2	IVA2.2 Cache Allocation .....	191
2.4.2	DSP Access to L2 Memories .....	192
2.4.2.1	DSP Access to L2 ROM .....	192
2.4.2.2	DSP Access to L2 RAM .....	192
2.4.3	DSP and EDMA Access to Memories and Peripherals .....	192
2.4.4	L3 Interconnect View of the IVA2.2 Subsystem Memory Space .....	193
2.4.5	DSP View of the IVA2.2 Subsystem Memory Space .....	193
2.4.6	EDMA View of the IVA2.2 Subsystem Memory Space .....	195
2.5	Revision History .....	196

<b>3</b>	<b>MPU Subsystem</b>	<b>197</b>
3.1	MPU Subsystem Overview	198
3.1.1	Introduction	198
3.1.2	Features	199
3.2	MPU Subsystem Integration	200
3.2.1	MPU Subsystem Clock and Reset Distribution	202
3.2.1.1	Clock Distribution	202
3.2.1.2	Reset Distribution	203
3.2.2	ARM Subchip	204
3.2.2.1	ARM Overview	204
3.2.2.2	ARM Description	205
3.2.2.2.1	ARM® Cortex™-A8 Instruction, Data, and Private Peripheral Port	205
3.2.2.2.2	MPU Subsystem Features	205
3.2.2.3	Clock, Reset, and Power Management	206
3.2.2.3.1	Clocks	206
3.2.2.3.2	Reset	206
3.2.2.3.3	Power Management	206
3.2.3	AXI2OCP and I2Async Bridges	206
3.2.3.1	Bridges Overview	206
3.2.3.2	AXI2OCP Description	207
3.2.3.3	AXI Tag to OCP Thread Remapping	208
3.2.3.4	Clocks, Reset, and Power Management	208
3.2.3.4.1	Clocks	208
3.2.3.4.2	Reset	209
3.2.3.4.3	Power Management	209
3.2.4	Interrupt Controller	209
3.2.4.1	Clocks	209
3.2.4.2	Reset	209
3.2.4.3	Power Management	209
3.3	MPU Subsystem Functional Description	210
3.3.1	Interrupts	210
3.3.2	Power Management	210
3.3.2.1	Power Domains	210
3.3.2.2	Power States	211
3.3.2.3	Power Modes	211
3.3.2.4	Transitions	215
3.4	MPU Subsystem Basic Programming Model	216
3.4.1	Clock Control	216
3.4.2	MPU Power Mode Transitions	216
3.4.2.1	Basic Power-On Reset	216
3.4.2.2	MPU Into Standby Mode	216
3.4.2.3	MPU Out of Standby Mode	216
3.4.2.4	MPU Power-On from a Powered-Off State	216
3.4.3	NEON Power Mode Transition	217
3.4.4	ARM Programming Model	217
3.5	Revision History	218
<b>4</b>	<b>Power, Reset, and Clock Management</b>	<b>219</b>
4.1	PRCM Introduction to Power Management	220
4.1.1	Goal of Power Management	220
4.1.2	Power-Management Techniques	220
4.1.2.1	Dynamic Voltage and Frequency Scaling	220
4.1.2.2	SmartReflex Adaptive Voltage Control	221
4.1.2.3	Dynamic Power Switching	222

4.1.2.4	Standby Leakage Management .....	223
4.1.2.5	DPS Versus SLM .....	223
4.1.2.6	Combining Power-Management Techniques .....	224
4.1.3	Architectural Blocks for Power Management .....	225
4.1.3.1	Clock Domain .....	225
4.1.3.2	Power Domain .....	226
4.1.3.3	Voltage Domain .....	227
4.1.4	Device Power-Management Architecture .....	227
4.1.4.1	Module Interface and Functional Clocks .....	229
4.1.4.2	Autoidle Clock Control .....	229
4.1.5	SmartReflex Voltage-Control Overview .....	231
4.1.5.1	Manual SmartReflex Voltage Control .....	232
4.1.5.2	Automatic SmartReflex Voltage Control .....	232
4.2	PRCM Overview .....	233
4.2.1	Introduction .....	233
4.2.2	PRCM Features .....	235
4.3	PRCM Environment .....	236
4.3.1	External Clock Signals .....	237
4.3.2	External Reset Signals .....	238
4.3.3	External Power Signals .....	239
4.4	PRCM Integration .....	240
4.4.1	Power-Management Scheme, Reset, and Interrupt Requests .....	243
4.4.1.1	Power Domain .....	243
4.4.1.2	Resets .....	243
4.4.1.3	Interrupt Requests .....	244
4.5	PRCM Reset Manager Functional Description .....	245
4.5.1	Overview .....	245
4.5.2	General Characteristics of Reset Signals .....	245
4.5.2.1	Scope .....	246
4.5.2.2	Occurrence .....	246
4.5.2.3	Source Type .....	246
4.5.3	Reset Sources .....	247
4.5.3.1	Global Reset Sources .....	247
4.5.3.2	Local Reset Sources .....	248
4.5.4	Reset Distribution .....	249
4.5.5	Power Domain Reset Descriptions .....	250
4.5.5.1	MPU Power Domain .....	250
4.5.5.2	NEON Power Domain .....	251
4.5.5.3	IVA2 Power Domain .....	251
4.5.5.4	CORE Power Domain .....	251
4.5.5.5	DSS Power Domain .....	252
4.5.5.6	CAM Power Domain .....	252
4.5.5.7	USBHOST Power Domain .....	252
4.5.5.8	SGX Power Domain .....	252
4.5.5.9	WKUP Power Domain .....	253
4.5.5.10	PER Power Domain .....	253
4.5.5.11	EMU Power Domain .....	253
4.5.5.12	SmartReflex Power Domain .....	253
4.5.5.13	DPLL Power Domains .....	254
4.5.5.14	EFUSE Power Domain .....	254
4.5.5.15	BANDGAP Logic .....	254
4.5.5.16	External Warm Reset Assertion .....	255
4.5.6	Reset Logging .....	255

4.5.6.1	PRCM Reset Logging Mechanism .....	255
4.5.6.2	SCM Reset Logging .....	255
4.5.7	Reset Management Overview .....	256
4.5.8	Reset Summary .....	261
4.5.9	Reset Sequences .....	265
4.5.9.1	Power-Up Sequence .....	265
4.5.9.2	Global Warm Reset Sequence .....	267
4.5.9.3	IVA2.2 Subsystem Power-Up Sequence .....	269
4.5.9.4	IVA2 Software Reset Sequence .....	271
4.5.9.5	IVA2 Global Warm Reset Sequence .....	273
4.5.9.6	IVA2 Power Domain Wake-Up Cold Reset Sequence .....	275
4.5.9.7	CPEFUSE Reset Sequence .....	277
4.6	PRCM Power Manager Functional Description .....	278
4.6.1	Overview .....	278
4.6.1.1	Introduction .....	278
4.6.1.2	Device Partitioning .....	279
4.6.1.3	Memory and Logic Power Management .....	282
4.6.1.4	Power Domain States .....	282
4.6.1.5	Power State Transitions .....	283
4.6.1.6	Device Power Modes .....	283
4.6.1.7	Isolation Between Power Domains .....	284
4.6.2	Power Domain Implementation .....	284
4.6.2.1	Device Power Domains .....	284
4.6.2.2	Power Domain Memory Status .....	286
4.6.2.3	Power Domain State Transition Rules .....	286
4.6.2.4	Power Domain Dependencies .....	286
4.6.2.5	Power Domain Controls .....	286
4.6.2.5.1	Power Domain Hardware Control .....	286
4.6.2.5.2	Power Domain Software Controls .....	287
4.7	PRCM Clock Manager Functional Description .....	288
4.7.1	Overview .....	288
4.7.1.1	Interface and Functional Clocks .....	289
4.7.2	External Clock I/Os .....	289
4.7.2.1	External Clock Inputs .....	289
4.7.2.1.1	32-kHz Always-On Clock .....	289
4.7.2.1.2	High-Frequency System Clock .....	289
4.7.2.1.3	Alternate Clock .....	290
4.7.2.2	External Clock Outputs .....	290
4.7.2.3	Summary .....	290
4.7.3	Internal Clock Generation .....	291
4.7.3.1	PRM .....	293
4.7.3.2	CM .....	295
4.7.3.3	DPLLs .....	298
4.7.3.3.1	DPLL1 (MPU) and DPLL2 (IVA2) .....	299
4.7.3.3.2	DPLL3 (CORE) .....	300
4.7.3.3.3	DPLL4 (Peripherals) .....	301
4.7.3.3.4	DPLL5 (Peripherals) .....	302
4.7.3.3.5	DPLL Clock Summary .....	303
4.7.3.4	32-kHz Oscillator .....	303
4.7.3.5	Summary .....	303
4.7.4	Clock Distribution .....	304
4.7.4.1	Power Domain Clock Distribution .....	304
4.7.4.1.1	MPU Power Domain .....	304

4.7.4.1.2	IVA2 Power Domain .....	304
4.7.4.1.3	SGX Power Domain .....	305
4.7.4.1.4	CORE Power Domain .....	306
4.7.4.1.5	EFUSE Power Domain .....	310
4.7.4.1.6	DSS Power Domain .....	310
4.7.4.1.7	CAM Power Domain .....	311
4.7.4.1.8	USBHOST Power Domain .....	313
4.7.4.1.9	WKUP Power Domain .....	314
4.7.4.1.10	PER Power Domain .....	315
4.7.4.1.11	SMARTREFLEX Power Domain .....	316
4.7.4.1.12	DPLL Domains .....	317
4.7.4.2	Clock Distribution Summary .....	318
4.7.4.2.1	Power Domain Source Clocks .....	318
4.7.4.2.2	Peripheral Module Clocks .....	320
4.7.5	External Clock Controls .....	321
4.7.5.1	Clock Request (sys_clkreq) Control .....	321
4.7.5.2	System Clock Oscillator Control .....	322
4.7.5.3	External Output Clock1 (sys_clkout1) Control .....	324
4.7.5.4	External Output Clock2 (sys_clkout2) Control .....	324
4.7.6	DPLL Control .....	325
4.7.6.1	DPLL Multiplier and Divider Factors .....	325
4.7.6.2	DPLL Jitter Correction .....	325
4.7.6.3	DPLL Frequency Ramp-Up Delay .....	326
4.7.6.4	DPLL Modes .....	326
4.7.6.5	DPLL Low-Power Mode .....	328
4.7.6.6	DPLL Clock Path Power Down .....	328
4.7.6.7	Latencies .....	329
4.7.6.8	Recalibration .....	329
4.7.6.9	DPLL Programming Sequence .....	331
4.7.7	Internal Clock Controls .....	331
4.7.7.1	PRM Source-Clock Controls .....	332
4.7.7.2	CM Source-Clock Controls .....	334
4.7.7.3	Common Interface Clock Controls .....	335
4.7.7.4	DPLL Source-Clock Controls .....	336
4.7.7.5	SGX Power Domain Clock Controls .....	337
4.7.7.6	CORE Power Domain Clock Controls .....	338
4.7.7.7	EFUSE Power Domain Clock Controls .....	341
4.7.7.8	DSS Power Domain Clock Controls .....	341
4.7.7.9	CAM Power Domain Clock Controls .....	342
4.7.7.10	USBHOST Power Domain Clock Controls .....	343
4.7.7.11	WKUP Power Domain Clock Controls .....	344
4.7.7.12	PER Power Domain Clock Controls .....	345
4.7.7.13	SMARTREFLEX Power Domain Clock Controls .....	347
4.7.8	Clock Configurations .....	347
4.7.8.1	Processor Clock Configurations .....	348
4.7.8.2	Interface and Peripheral Functional Clock Configurations .....	349
4.8	PRCM Idle and Wake-Up Management .....	351
4.8.1	Overview .....	351
4.8.2	Sleep Transition .....	354
4.8.3	Wakeup .....	354
4.8.4	Device Wake-Up Events .....	355
4.8.5	Sleep and Wake-Up Dependencies .....	360
4.8.5.1	Sleep Dependencies .....	360

4.8.5.1.1	CORE Power Domain Sleep Transition Constraint .....	363
4.8.5.2	Wake-Up Dependencies .....	363
4.8.6	USBHOST/USBTLL Save-and-Restore Management .....	366
4.8.6.1	USBHOST SAR Sequences .....	368
4.8.6.1.1	Save Sequence on Sleep Transition .....	368
4.8.6.1.2	Restore Sequence on Wake-Up Transition .....	368
4.8.6.2	USB TLL SAR Sequences .....	368
4.8.6.2.1	Save Sequence on Sleep Transition .....	368
4.8.6.2.2	Restore Sequence on Wake-Up Transition .....	368
4.9	PRCM Interrupts .....	369
4.10	PRCM Voltage Management Functional Description .....	371
4.10.1	Overview .....	371
4.10.2	Voltage Domains .....	374
4.10.3	Voltage Domains Dependencies .....	375
4.10.4	Voltage-Control Architecture .....	376
4.10.5	VDD1 and VDD2 Control .....	378
4.10.5.1	Direct Control with VMODE Signals .....	379
4.10.5.2	Direct Voltage Control with I <sup>2</sup> C Interface .....	379
4.10.5.3	Voltage Controller and Dedicated SmartReflex I <sup>2</sup> C Interface .....	380
4.10.5.4	SmartReflex Voltage Control .....	380
4.10.5.4.1	SmartReflex in the Device .....	381
4.10.6	Analog Cells, LDOs, and Level Shifter Controls .....	381
4.10.6.1	SRAM Voltage Control .....	381
4.10.6.2	Wake-Up and Emulation Voltage Control .....	382
4.11	PRCM Off-Mode Management .....	383
4.11.1	Overview .....	383
4.11.2	Device Off-Mode Configuration .....	383
4.11.3	CORE Power Domain OFF-Mode Sequences .....	384
4.11.3.1	Sleep Sequences (Transition From ON to RETENTION/OFF) .....	384
4.11.3.2	Wake-Up Sequences (Transition from RETENTION/OFF to ON) .....	385
4.11.4	Device Off-Mode Sequences .....	385
4.11.4.1	Sleep Sequences .....	386
4.11.4.1.1	Device Off-Mode Transition without Using the SYS_OFF_MODE Signal .....	386
4.11.4.1.2	Device Off-Mode Transition Using Only the SYS_OFF_MODE Signal .....	387
4.11.4.2	Wake-Up Sequences .....	387
4.11.4.2.1	Device Wakeup from Off Mode without Using the SYS_OFF_MODE Signal .....	387
4.11.4.2.2	Device Wakeup from Off Mode Using Only the SYS_OFF_MODE Signal .....	388
4.12	PRCM Basic Programming Model .....	388
4.12.1	Global Registers .....	388
4.12.1.1	Revision Information Registers .....	388
4.12.1.2	PRCM Configuration Registers .....	388
4.12.1.3	Interrupt Configuration Registers .....	389
4.12.1.3.1	MPU Interrupt Event Sources .....	389
4.12.1.3.2	MPU Interrupt Registers .....	390
4.12.1.3.3	IVA2.2 Interrupt Event Sources .....	390
4.12.1.3.4	IVA2 Interrupt Registers .....	390
4.12.1.4	Event Generator Control Registers .....	391
4.12.1.5	Output Signal Polarity Control Registers .....	391
4.12.1.5.1	CM_POLCTRL (CM Polarity Control Register) .....	391
4.12.1.5.2	PRM_POLCTRL (PRM Polarity Control Register) .....	393
4.12.1.6	SRAM Precharge Time Control Register .....	393
4.12.1.6.1	PRM_SRAM_PCHARGE (Voltage SRAM Precharge Counter Register) .....	393
4.12.2	Clock Management Registers .....	393

4.12.2.1	System Clock Control Registers .....	393
4.12.2.1.1	PRM_CLKSRC_CTRL (Clock Source Control Register) .....	393
4.12.2.1.2	PRM_CLKSETUP (Source-Clock Setup Register) .....	393
4.12.2.1.3	PRM_CLKSEL (Source-Clock Selection Register) .....	393
4.12.2.2	External Clock Output Control Registers .....	394
4.12.2.2.1	PRM_CLKOUT_CTRL (Clock Out Control Register) .....	394
4.12.2.2.2	CM_CLKOUT_CTRL (Clock Out Control Register) .....	394
4.12.2.3	DPLL Clock Control Registers .....	394
4.12.2.3.1	CM_CLKSELn_PLL_<processor_name> (Processor DPLL Clock Selection Register) ....	394
4.12.2.3.2	CM_CLKSELn_PLL (DPLL Clock Selection Register) .....	394
4.12.2.3.3	CM_CLKEN_PLL_<processor_name> (Processor DPLL Clock Enable Register) .....	395
4.12.2.3.4	CM_CLKEN_PLL (DPLL Enable Register) .....	395
4.12.2.3.5	CM_AUTOIDLE_PLL_<processor_name> (Processor DPLL Autoidle Register) .....	396
4.12.2.3.6	CM_AUTOIDLE_PLL (DPLL Autoidle Register) .....	396
4.12.2.3.7	CM_AUTOIDLE1_PLL (DPLL5 Autoidle Register) .....	396
4.12.2.3.8	CM_IDLEST_CKGEN (Source-Clock Idle-Status Register) .....	396
4.12.2.3.9	CM_IDLEST2_CKGEN (DPLL5 Source-Clock Idle-Status Register) .....	397
4.12.2.3.10	CM_IDLEST_PLL_<processor_name> (Processor DPLL Idle-Status Register) .....	397
4.12.2.4	Power-Domain Clock Control Registers .....	397
4.12.2.4.1	CM_CLKSEL_<domain_name> (Clock Select Register) .....	397
4.12.2.4.2	CM_FCLKEN_<domain_name> (Functional Clock Enable Register) .....	398
4.12.2.4.3	CM_ICLKEN_<domain_name> (Interface Clock Enable Register) .....	398
4.12.2.4.4	CM_AUTOIDLE_<domain_name> (Autoidle Register) .....	399
4.12.2.4.5	CM_IDLEST_<domain_name> (Idle-Status Register) .....	399
4.12.2.4.6	CM_CLKSTCTRL_<domain_name>(Clock State Control Register) .....	400
4.12.2.4.7	CM_CLKSTST_<domain_name> (Clock State Status Register) .....	401
4.12.2.4.8	CM_SLEEPDEP_<domain_name> (Sleep Dependency Control Register) .....	401
4.12.2.5	Domain Wake-Up Control Registers .....	402
4.12.2.5.1	PM_WKEN_<domain_name> (Wake-Up Enable Register) .....	403
4.12.2.5.2	PM_WKST_<domain_name> (Wake-Up Status Register) .....	403
4.12.2.5.3	PM_WKDEP_<domain_name> (Wake-Up Dependency Register) .....	403
4.12.2.5.4	PM_<processor_name>GRPSEL_<domain_name> (Processor Group Selection Register) .....	405
4.12.3	Reset Management Registers .....	405
4.12.3.1	Reset Control .....	405
4.12.3.1.1	PRM_RSTTIME (Reset Time Register) .....	405
4.12.3.1.2	RM_RSTCTRL_<domain_name> (Reset Control Register) .....	405
4.12.3.1.3	RM_RSTST_<domain_name> (Reset Status Register) .....	406
4.12.4	Power Management Registers .....	407
4.12.4.1	PM_PWSTCTRL_<domain_name> (Power State Control Register) .....	407
4.12.4.2	PM_PWSTST_<domain_name> (Power State Status Register) .....	409
4.12.4.3	PM_PREPWSTST_<domain_name> (Previous Power State Status Register) .....	410
4.12.5	Voltage Management Registers .....	410
4.12.5.1	External Voltage Control Register Descriptions .....	410
4.12.5.1.1	PRM_VOLTSETUP (Voltage Setup Time Register) .....	411
4.12.5.1.2	PRM_VOLTOFFSET (Voltage Offset Register) .....	411
4.12.5.1.3	PRM_VOLTCTRL (Voltage Source Control Register) .....	412
4.12.5.2	Voltage Controller Registers .....	412
4.12.5.2.1	PRM_VC_SMPS_SA (Voltage Controller SMPS Slave Address Register) .....	413
4.12.5.2.2	PRM_VC_SMPS_VOL_RA (Voltage Controller SMPS Voltage Register Address Register) .....	413
4.12.5.2.3	PRM_VC_SMPS_CMD_RA (Voltage Controller SMPS Command Register Address Register) .....	413
4.12.5.2.4	PRM_VC_CMD_VAL_0 and PRM_VC_CMD_VAL_1 (Voltage Controller Command and	

	Voltage Value Register 0 and 1) .....	413
4.12.5.2.5	PRM_VC_CH_CONF (Voltage Controller Channel Configuration Register) .....	413
4.12.5.2.6	PRM_VC_I2C_CFG (Voltage Controller I <sup>2</sup> C Interface Configuration Register) .....	413
4.12.5.2.7	PRM_VC_BYPASS_VAL (Voltage Controller Bypass Command Register) .....	414
4.12.6	Generic Programming Examples .....	414
4.12.6.1	Clock Control .....	414
4.12.6.1.1	Enabling and Disabling the Functional Clocks .....	414
4.12.6.1.2	Enabling and Disabling the Interface Clocks .....	416
4.12.6.1.3	Enabling and Disabling the INACTIVE State .....	417
4.12.6.1.4	Processor Clock Control .....	418
4.12.6.2	Reset Management .....	421

15-48. Virtual Channel Controller .....	2158
15-49. DSI Video Mode: Nonburst Transfer With VE and HE .....	2162
15-50. DSI Video Mode: Nonburst Transfer Without VE and HE.....	2162
15-51. DSI Video Mode: Burst Transfer Without VE and HE .....	2163
15-52. DSI General Frame Structure.....	2164
15-53. DSI General Frame Structure Using Burst Mode .....	2165
15-54. DSI General Frame Structure Using Burst Mode and Interleaving .....	2166
15-55. 24 bits per Pixel RGB Color Format, Long Packet.....	2168
15-56. 18 Bits per Pixel (Loosely Packed) RGB Color Format, Long Packet.....	2169
15-57. 18 Bits per Pixel (Packed) RGB Color Format, Long Packet.....	2170
15-58. 16 Bits per Pixel RGB Color Format, Long Packet .....	2171

15-59. 24 Bits Per Pixel With One Data Channel.....	2172
15-60. 24 Bits Per Pixel With Two Data Channels .....	2172
15-61. 24 Bits Per Pixel With Three Data Channels .....	2172
15-62. TV Display Interface (S-Video Mode).....	2173
15-63. TV Display Interface (Composite Mode) .....	2174
15-64. Display Subsystem Integration .....	2177
15-65. Display Subsystem Clock Tree .....	2179
15-66. Display Subsystem DMA Tree.....	2188
15-67. DSI Interrupt Tree .....	2190
15-68. DISPC and DSS Interrupts Tree .....	2191
15-69. Display Subsystem Full Schematic .....	2195
15-70. Display Controller Architecture Overview .....	2196
15-71. Palette/Gamma Correction Architecture.....	2200
15-72. YCbCr 4:2:2 to YCbCr 4:4:4 (0- or 180-Degree Rotation) .....	2203
15-73. YCbCr 4:2:2 to YCbCr 4:4:4 (90- or 270-Degree Rotation).....	2203
15-74. Interpolation of the Missing Chrominance Component .....	2203
15-75. YCbCr to RGB Registers (VIDFULLRANGE=0).....	2204
15-76. YCbCr to RGB Registers (VIDFULLRANGE=1).....	2204
15-77. Color Space Conversion Macro-Architecture .....	2205
15-78. Video Upsampling .....	2206
15-79. Resampling Macro-Architecture (3-Coefficient Processing) .....	2207
15-80. Overlay Manager in Normal Mode .....	2210
15-81. Display Attributes in Normal Mode .....	2210
15-82. Overlay Manager in Alpha Mode .....	2212
15-83. Display Attributes in Alpha Mode.....	2212
15-84. Alpha Blending Macro Architecture .....	2213
15-85. Video Source Transparency Example .....	2215
15-86. Graphics Destination Transparency Example .....	2216
15-87. Color Phase Rotation Matrix .....	2217
15-88. Color Phase Rotation Macro Architecture.....	2217
15-89. DSI Protocol Engine.....	2220
15-90. DSI Transmitter/Receiver Data Flow.....	2221
15-91. LP to HS Timing .....	2222
15-92. HS to LP Timing .....	2224
15-93. HS Command Mode Interleaving.....	2228
15-94. LP Command Mode Interleaving .....	2231
15-95. Complex I/O Power FSM .....	2234
15-96. DSI PLL Power FSM .....	2236
15-97. DSI PLL HS Clock FSM .....	2237
15-98. ForceTxStopMode FSM .....	2239
15-99. TurnRequest FSM.....	2240
15-100. High-Speed TX Timer FSM.....	2241
15-101. Low-Power RX Timer FSM .....	2242
15-102. 64-Bit ECC Generation on TX Side.....	2246
15-103. Checksum Transmission .....	2246
15-104. 16 Bit CRC Generation Using a Shift Register .....	2247
15-105. DSI PLL Controller Overview .....	2248
15-106. DSI PLL Reference Diagram .....	2249
15-107. DSI Complex I/O Architecture .....	2251

15-108. RFBI Architecture Overview .....	2252
15-109. Video Encoder Architecture Overview.....	2255
15-110. Closed Captioning Timing.....	2258
15-111. WSS Timing.....	2260
15-112. Dual 10-Bit Video DAC Architecture.....	2261
15-113. DC-Coupling TV Detect Waveforms for TV Connected and Disconnected .....	2264
15-114. AC-Coupling TV Detect Waveforms for TV Connected and Disconnected .....	2264
15-115. GPIO Signal Waveform Proposal for TV Detection/Disconnection in DC-Coupling Mode .....	2265
15-116. GPIO Signal Waveform Proposal for TV Detection/Disconnection in AC-Coupling Mode .....	2265
15-117. Bypass Mode .....	2266
15-118. DAC Test Mode in Composite Video Mode .....	2267
15-119. DAC Test Mode in Separate Video Mode .....	2267
15-120. SDI Architecture Overview .....	2269
15-121. Overlay Optimization: Case 1 .....	2276
15-122. Overlay Optimization: Case 2 .....	2276
15-123. Overlay Optimization: Case 3 .....	2277
15-124. 90-Degree DMA Rotation Example.....	2283
15-125. Rotation/Mirroring Settings.....	2286
15-126. 90° Rotation With Mirroring .....	2287
15-127. Offset for VRFB Rotation.....	2289
15-128. Offset for VRFB Rotation With Mirroring .....	2291
15-129. Timing Values Description (Active Matrix Display) .....	2293
15-130. PCDmin Formulas (V Down-Sampling Only) .....	2295
15-131. Color Phase Rotation Matrix.....	2298
15-132. Color Phase Rotation Matrix (R Component Only) .....	2298
15-133. Color Phase Rotation Matrix (G Component Only).....	2298
15-134. Color Phase Rotation Matrix (B Component Only) .....	2298
15-135. DSI PLL Programming Blocks.....	2313
15-136. DSI PLL Go Sequence (Manual Mode) .....	2314
15-137. DSI PLL Go Sequence (Automatic Mode) .....	2315
15-138. Gated Mode Sequence .....	2316
15-139. DSI PLL Programming Sequence.....	2318
15-140. High-Speed Clock Transmission .....	2322
15-141. High-Speed Data Transmission .....	2324
15-142. How to use RFBI .....	2333
15-143. RFBI Initial Configuration .....	2334
15-144. RFBI Output Enable .....	2335
15-145. SDI Start Sequence.....	2341
15-146. SDI Stop Sequence.....	2342
15-147. SDI Clock Source/Frequency Change Sequence Part A .....	2343
15-148. SDI Clock Source/Frequency Change Sequence Part B .....	2344
15-149. Vertical Filtering Macro Architecture (Three Taps) .....	2346
15-150. Vertical Filtering Macro Architecture (Five Taps) .....	2347
15-151. Horizontal Filtering Macro Architecture (Five Taps) .....	2348
15-152. Vertical Up-/Down-Sampling Algorithm .....	2349
15-153. Horizontal Up-/Down-Sampling Algorithm .....	2350
15-154. QVGA LCD Timings .....	2361
15-155. Overview .....	2363
16-1. Timers.....	2536

16-2. GP Timers Overview .....	2537
16-3. GP Timers External System Interface .....	2539
16-4. GP Timer Integration.....	2540
16-5. Wake-Up Request Generation.....	2544
16-6. Block Diagram of GPTIMER3 through GPTIMER9, GPTIMER11, and GPTIMER12 .....	2547
16-7. Block Diagram of GPTIMER1, GPTIMER2, and GPTIMER10 .....	2548
16-8. GPTi.TCRR Timing Value .....	2549
16-9. Block Diagram of the 1-ms Tick Module.....	2550
16-10. Capture Wave Example for GPTi.TCLR[13] CAPT_MODE = 0.....	2552
16-11. Capture Wave Example for GPTi.TCLR[13] CAPT_MODE = 1 .....	2552
16-12. Timing Diagram of PWM with GPTi.TCLR[7] SCPWM Bit = 0 .....	2554
16-13. Timing Diagram of PWM with GPTi.TCLR[7] SCPWM Bit = 1 .....	2554
16-14. WDTs Block Diagram .....	2582
16-15. WDT Integration .....	2583
16-16. 32-Bit WDT Functional Block Diagram .....	2586
16-17. WDT General Functional View .....	2587
16-18. 32-kHz Sync Timer Block Diagram .....	2599
17-1. UART Module .....	2606
17-2. UART Mode Bus System Overview.....	2609
17-3. IrDA System Overview.....	2609
17-4. CIR System Overview .....	2610
17-5. UART Frame Data Format .....	2611
17-6. IrDA SIR Frame Format .....	2612
17-7. IrDA SIR Encoding Mechanism.....	2613
17-8. IrDA SIR Decoding Mechanism .....	2614
17-9. SIR Free Format Mode .....	2615
17-10. MIR Transmit Frame Format.....	2615
17-11. MIR Baud Rate Adjustment Mechanism .....	2616
17-12. SIP.....	2616
17-13. CIR Pulse Modulation.....	2618
17-14. CIR Modulation Duty Cycle .....	2619
17-15. RC-5 Bit Encoding.....	2620
17-16. SIRC Bit Encoding .....	2620
17-17. RC-5 Standard Packet Format .....	2621
17-18. SIRC Packet Format .....	2621
17-19. SIRC Bit Transmission Example .....	2621
17-20. UART Functional Integration.....	2622
17-21. UART/IrDA/CIR Block Diagram.....	2626
17-22. FIFO Management Registers .....	2627
17-23. Receive FIFO Interrupt Request Generation .....	2629
17-24. Transmit FIFO Interrupt Request Generation.....	2629
17-25. Receive FIFO DMA Request Generation (32 Characters).....	2631
17-26. Transmit FIFO DMA Request Generation (56 Spaces) .....	2632
17-27. Transmit FIFO DMA Request Generation (8 Spaces).....	2633
17-28. Transmit FIFO DMA Request Generation (1 Space) .....	2633
17-29. Transmission Process .....	2634
17-30. Reception Process .....	2634
17-31. Baud Rate Generation .....	2640
17-32. Baud Rate Generator .....	2647

17-33. CIR Mode Block Components .....	2652
18-1. HS I <sup>2</sup> C Controllers .....	2719
18-2. Multimaster HS I <sup>2</sup> C Controllers and Typical Connections to I <sup>2</sup> C Devices .....	2721
18-3. Multimaster HS I <sup>2</sup> C Controller Interface Signals in I <sup>2</sup> C Mode .....	2721
18-4. I <sup>2</sup> C Data Transfer .....	2722
18-5. Bit Transfer on the I <sup>2</sup> C Bus .....	2722
18-6. Start (S) and Stop (P) Condition Events.....	2723
18-7. I <sup>2</sup> C Data Transfer Formats in F/S Mode .....	2723
18-8. I <sup>2</sup> C Data Transfers in HS Mode.....	2724
18-9. Arbitration Between Master Transmitters.....	2725
18-10. Synchronization of I <sup>2</sup> C Clock Generators.....	2725
18-11. Multimaster HS I <sup>2</sup> C Controllers and Typical Connections to SCCB Devices .....	2726
18-12. Multimaster HS I <sup>2</sup> C Controller Interface Signals in SCCB Mode .....	2727
18-13. 3-wire SCCB Transmission Timing Diagram.....	2728
18-14. SCCB Transmission Data Formats .....	2728
18-15. Typical Connection Between the HS I <sup>2</sup> C Controller and Power Chip(s) .....	2730
18-16. HS I <sup>2</sup> C Controller I2C4 Interface Signals .....	2730
18-17. I <sup>2</sup> C Data Transfer Format in F/S Mode for the I2C4 Module.....	2731
18-18. I <sup>2</sup> C Data Transfer Format in HS Mode for the I2C4 Module .....	2732
18-19. HS I <sup>2</sup> C Controller Integration .....	2733
18-20. Wake-up Generation Flow.....	2736
18-21. Multimaster HS I <sup>2</sup> C Controller Block Diagram .....	2741
18-22. Receive FIFO Interrupt Request Generation .....	2743
18-23. Transmit FIFO Interrupt Request Generation.....	2743
18-24. Receive FIFO DMA Request Generation .....	2745
18-25. Transmit FIFO Request Generation (High Threshold).....	2746
18-26. Transmit FIFO Request Generation (Low Threshold) .....	2746
18-27. I <sup>2</sup> C Clock Generation.....	2748
18-28. I <sup>2</sup> C Setup Procedure .....	2754
18-29. I <sup>2</sup> C Master Transmitter Mode, Polling Method, in F/S and HS Modes .....	2755
18-30. I <sup>2</sup> C Master Receiver Mode, Polling Method, in F/S and HS Modes .....	2756
18-31. I <sup>2</sup> C Master Transmitter Mode, Interrupt Method, in F/S and HS Modes.....	2757
18-32. I <sup>2</sup> C Master Receiver Mode, Interrupt Method, in F/S and HS Modes.....	2758
18-33. I <sup>2</sup> C Master Transmitter Mode, DMA Method in F/S and HS Modes .....	2759
18-34. I <sup>2</sup> C Master Receiver Mode, DMA Method in F/S and HS Modes .....	2760
18-35. I <sup>2</sup> C Slave Transmitter/Receiver Mode, Polling .....	2761
18-36. I <sup>2</sup> C Slave Transmitter/Receiver Mode, Interrupt .....	2762
18-37. SCCB Setup Procedure .....	2764
18-38. SCCB Master Transmitter Mode, Polling.....	2765
18-39. SCCB Master Receiver Mode, Polling.....	2766
18-40. SCCB Master Transmitter Mode, Interrupt.....	2767
18-41. SCCB Master Receiver Mode, Interrupt .....	2768
18-42. Overview.....	2770
18-43. Environment.....	2771
18-44. Data Transfer Format .....	2771
18-45. Initial Configuration Flowchart .....	2777
18-46. Data Writing into the TPS65950 Companion Chip Register by the I2C1 Module.....	2778
18-47. Data Writing into the VS6650 Digital Camera Device Register by the I2C3 Module .....	2779
19-1. Multichannel Modules SPI1, SPI2, SPI3, and SPI4.....	2805

19-2. Typical Application using the McSPI .....	2807
19-3. McSPI Master Mode (Full-Duplex) .....	2808
19-4. McSPI Master Single Mode (Receive-Only) .....	2808
19-5. McSPI Slave Mode (Full Duplex) .....	2809
19-6. McSPI Slave Single Mode (Transmit Only) .....	2809
19-7. McSPI Interface Signals in Master Mode.....	2810
19-8. McSPI Interface Signals in Slave Mode .....	2810
19-9. Phase and Polarity Combinations .....	2812
19-10. Full-Duplex Transfer Format with PHA = 0 .....	2813
19-11. Extended SPI Transfer with a Start-Bit (SBE = 1) .....	2814
19-12. McSPI Integration .....	2815
19-13. McSPI Block Diagram.....	2819
19-14. SPI Full-Duplex Transmission (Example) .....	2821
19-15. Continuous Transfers with SPIM_CSX Maintained Active (Single-Data-Pin Interface Mode).....	2823
19-16. Continuous Transfers with SPIM_CSX Maintained Active (Dual-Data-Pin Interface Mode) .....	2823
19-17. Chip-Select SPIEN Timing Controls .....	2824
19-18. Example of McSPI Slave with One Master and Multiple Slave Devices on Channel 0 .....	2827
19-19. SPI Half-Duplex Transmission (Transmit-Only Slave).....	2829
19-20. SPI Half-Duplex Transmission (Receive-Only Slave).....	2830
19-21. Buffer Use in Transmit Direction Only .....	2831
19-22. Buffer Use in Receive Direction Only .....	2831
19-23. Buffer Use in Transmit/Receive Direction .....	2831
19-24. Buffer Almost Full Level (AFL).....	2832
19-25. Buffer Almost Empty Level (AEL) .....	2833
19-26. Module Initialization Flow .....	2840
19-27. Common Transfer Sequence: Main Process .....	2841
19-28. Transmit and Receive (Master and Slave) .....	2843
19-29. Transmit-Only with Interrupts (Master and Slave) .....	2844
19-30. Transmit-Only with DMA (Master and Slave) .....	2845
19-31. Receive Only with Interrupt (Master Normal) .....	2846
19-32. Receive-Only with DMA (Master Normal) .....	2847
19-33. Receive-Only with Interrupt (Master Turbo).....	2848
19-34. Receive-Only with DMA (Master Turbo).....	2849
19-35. Receive Only (Slave).....	2850
19-36. Two SPI Transfers with PHA = 0 (Flexibility of McSPI) .....	2851
19-37. Common Transfer Sequence/Main Process .....	2854
19-38. Transmit-Receive with Word Count .....	2856
19-39. Transmit-Receive without Word Count .....	2857
19-40. Transmit-Only .....	2858
19-41. Receive-Only with Word Count .....	2859
19-42. Receive-Only without Word Count .....	2860
19-43. Overview .....	2861
19-44. Environment .....	2862

## ***Introduction***

---

---

---

This chapter introduces the features, supporting subsystems, and architecture of the OMAP35x high-performance applications processors.

<b>Topic</b>	<b>Page</b>
<b>1.1 Overview .....</b>	<b>154</b>
<b>1.2 Environment .....</b>	<b>156</b>
<b>1.3 Description .....</b>	<b>157</b>
<b>1.4 Package-On-Package Concept .....</b>	<b>163</b>
<b>1.5 OMAP35x Family .....</b>	<b>165</b>
<b>1.6 Revision History .....</b>	<b>173</b>

## 1.1 Overview

The OMAP35x family of high-performance, applications processors are based on the enhanced OMAP™ 3 architecture and are integrated on TI's advanced 65-nm process technology.

---

**NOTE:** The OMAP 3 architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future OMAP35x devices. Some features may not be available or supported in your particular device. For more information, see [Section 1.5, \*OMAP35x Family\*](#) and your device-specific data manual.

---

The architecture is designed to provide best-in-class video, image, and graphics processing sufficient to support the following:

- Streaming video
- 2D/3D mobile gaming
- Video conferencing
- High-resolution still image
- Video capture in 2.5G wireless terminals, 3G wireless terminals, and rich multimedia-featured handsets, and high-performance personal digital assistants (PDAs).

This OMAP device also features the M-Shield™ mobile security technology to enable more secure e-commerce applications and the replay of copyright-protected digital media content.

Security features integrated on the devices support applications designed for:

- Protection against malicious attacks
- M-commerce
- Content protection for recordable media (CPRM)
- Digital rights management (DRM)

High-security (HS) devices rely on a security scheme based on hardware mechanisms and a secure read-only memory (ROM) code, ensuring that only trusted code can access the secure resources. These resources are in specific regions of memories as well as in peripherals, hardware cryptographic accelerators, and eFuse keys. General-purpose (GP) devices do not include a security feature.

---

**NOTE:** This technical reference manual focuses only on general-purpose (GP) devices. To determine if a high-security (HS) version of your device is available and for more information on HS devices, see [Section 1.5, \*OMAP35x Family\*](#), and your device-specific data manual.

---

The device supports high-level operating systems (OSs), such as:

- Windows CE
- Linux

This OMAP device includes state-of-the-art power-management techniques required for high-performance mobile products.

The following subsystems are part of the device:

- Microprocessor unit (MPU) subsystem based on the ARM® Cortex™-A8 microprocessor
- IVA2.2 subsystem with a C64x+ digital signal processor (DSP) core
- SGX subsystem for 2D and 3D graphics acceleration to support display and gaming effects

---

**NOTE:** IVA2.2 and SGX are not available on all devices. See [Section 1.5, \*OMAP35x Family\*](#), for more information on available features.

---

- Camera image signal processor (ISP) that supports multiple formats and interfacing options connected to a wide variety of image sensors
- Display subsystem with a wide variety of features for multiple concurrent image manipulation, and a

programmable interface supporting a wide variety of displays. The display subsystem also supports NTSC/PAL video out.

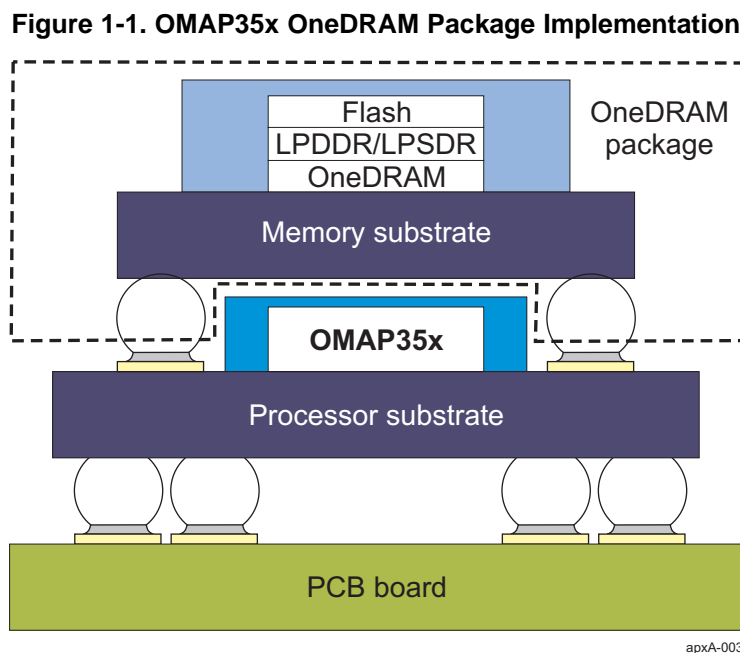

- Level 3 (L3) and level 4 (L4) interconnects that provide high-bandwidth data transfers for multiple initiator [Section 1.4s](#) to the internal and external memory controllers and to on-chip peripherals

The device also offers:

- A comprehensive power and clock-management scheme that enables high-performance, low-power operation, and ultralow-power standby features. The device also supports SmartReflex™ adaptative voltage control. This power management technique for automatic control of the operating voltage of a module reduces the active power consumption.
- A memory stacking feature using the package-on-package (POP) implementation (see [, Package-on-Package Concept](#))

### 1.1.1 OneDRAM Implementation

Figure 1-1 shows the OMAP35x OneDRAM implementation.

A maximum of three memory dies of LPDDR and/or the flash type can be assembled into a packaged memory device for the OMAP35x processor. The pads of the dies are connected to bottom balls that form the memory package footprint (balls of the memory substrate). Around the encapsulated dies, on the processor substrate, a TOP-BGA footprint matches the memory package footprint; the memory device is soldered onto the processor substrate. Some processor pads are connected to the TOP-BGA footprint and to the bottom balls. Other processor pads are connected to only the BOTTOM-BGA balls.

The memory device balls can be connected to the bottom balls using the feed-through (FT) pads of the processor substrate. The bottom balls form the BOTTOM-BGA processor package footprint. The BOTTOM-BGA footprint matches the PCB footprint to which the POP device is soldered on the board.

## 1.2 Environment

This section provides an overview of the OMAP environment. The device is associated with a power integrated circuit (IC). Texas Instruments provides a global solution with the TPS65950 device. For more information on the TPS65950 device, contact your TI representative.

Figure 1-2 provides an overview of a nonexhaustive environment for the high-tier OMAP35x device.

Figure 1-2. OMAP35x Environment Using TPS65950

108-001

**NOTE:** Some features are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

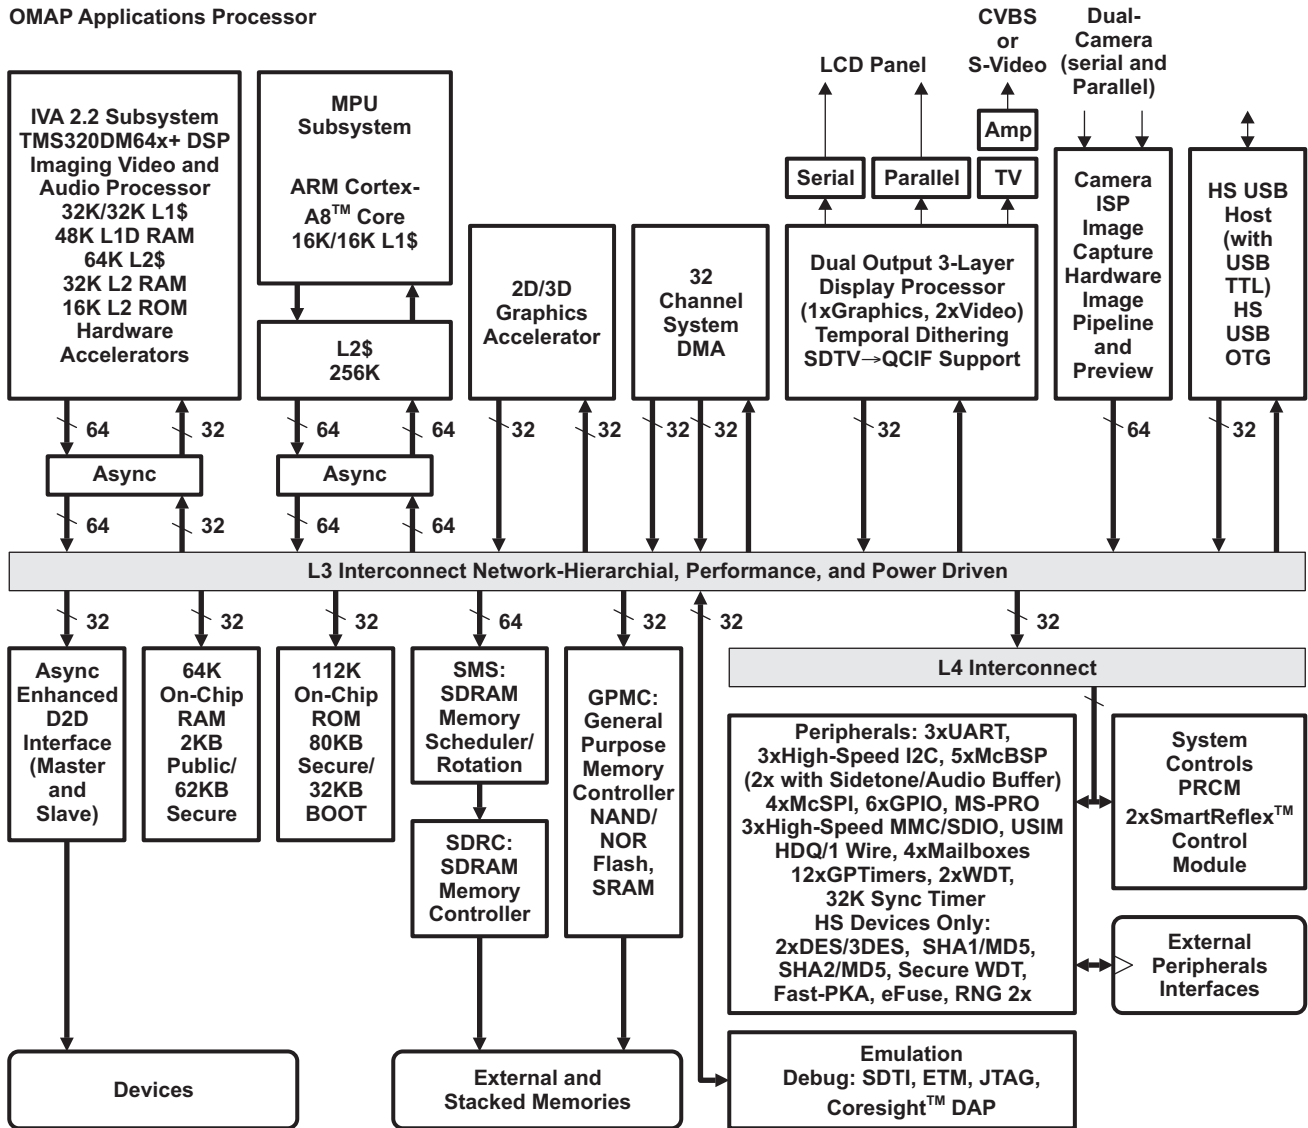

### 1.3 Description

The device is offered in two packages:

- CBB package: 515-ball, 12 x 12 mm, package-on-package (POP) 0.5-mm (top) and 0.4-mm (bottom) ball pitch package. Some balls are available at the top of the device to allow memory stacking. For more information, see [Section 1.4, Package-on-Package Concept](#).
- CUS package: 423-ball, 16 x 16mm, 0.65-mm (bottom) ball pitch package

Figure 1-3 shows the block diagram.

Figure 1-3. Block Diagram

**NOTE:** Some features are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

### 1.3.1 MPU Subsystem

The MPU subsystem integrates the following modules

- ARM subchip
  - ARM® Cortex™-A8 core
  - ARM Version 7™ ISA: Standard ARM instruction set + Thumb®-2, Jazelle® RCT Java accelerator, and media extensions
  - NEON™ SIMD coprocessor (VFP lite + media streaming instructions)
  - Cache memories
    - Level 1: 16KB instruction and 16KB data—4-way set associative cache, 64 bytes/line
    - Level 2: see [Section 1.5](#), *OMAP35x Family*.
- Interrupt controller (MPU IN TC) of 96 synchronous interrupt lines
- Asynchronous interface with core logic
- Debug, trace, and emulation features: ICE-Crusher, ETM, ETB modules.

### 1.3.2 IVA2.2 Subsystem

The device includes a high-performance imaging video and audio (IVA2.2) accelerator based on the Texas Instruments TMS320DMC64x+ VLIW DSP core.

The IVA2.2 subsystem includes the following main features:

- 32-bit fixed-point media processor
- Very long instruction word (VLIW) architecture based on the programmable enhanced version of C64x DSP core
- Eight instructions/cycle, eight execution units
  - Optimized instruction set for video and imaging processing
  - Eight 8 x 8 or 16 x 16 multiply accumulate (MAC) per cycle
  - Eight slave asynchronous die (SAD) per cycle
  - Eight interpolations (a + b + 1)>>1 per cycle
  - Two (32-bit x 32-bit > 64-bit) multiply operations per cycle
- Low-power processor and megacell
  - Dynamically mixed 32-bit and 16-bit instruction sets
  - Software pipelined loop (SPLOOP) instruction buffer
  - Separate power domain
  - Supported multiple power-down states
- Two-level memory subsystem hierarchy
  - L1P (program)
    - 32KB direct-mapped cache—32-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/32KB memory, 4KB/28KB, 8KB/24KB, 16KB/16KB, or 32KB/0KB)
  - L1D (data)
    - 32KB 2-way set associative cache—4-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/32KB memory, 4KB/28KB, 8KB/24KB, 16KB/16KB, or 32KB/0KB)
    - 48KB memory-mapped SRAM
  - L2 (program and data)
    - 64KB 4-way set associative cache—128-byte cache line, configurable as cache or memory mapped (Possible values are: 0KB cache/64KB memory, 32KB/32KB, or 64KB/0KB)
    - 32KB memory-mapped SRAM
    - 16KB ROM
- Video hardware accelerators
  - Improved motion estimation (iME) dedicated hardware
  - Improved loop filtering (iLF) dedicated hardware

- Improved variable length coder/decoder (iVLCD) with quantizing capabilities dedicated hardware
- Video dedicated sequencer
- Video local interconnect
- Local level 2 (L2) memory interface/arbiter
- Private direct memory access (DMA) controller:
  - 128 logical channels
  - 1D/2D addressing
  - Chaining capability
  - Fully pipelined, two 64-bit read ports, two 64-bit write ports
  - Single access 32-byte or 64-byte incrementing bursts
- Level 1 (L1) interrupt controller (INTC)
- Local IVA2.2 digital phase-locked loop (DPLL) supplying the IVA2.2 subsystem clocking
- 32-entry memory management unit (MMU) for seamless integration in high-level OS environment
- IVA2.2 system interfaces
  - 64-bit L3 port shared for external memory accesses
    - Multithreaded link shared by DSP core and DMA accesses
    - Interface with the L3 interconnect that can be synchronous or asynchronous for clock decoupling between IVA2.2 and L3 interconnect
    - Incrementing burst support
    - Critical line first to reduce line fetch latency to the processor
  - Host port interface (HPI) for MMU programming and access to the IVA2.2 internal memories. Can be synchronous or asynchronous
  - System interfaces: clocking, power management
- C-friendly environment (state-of-the-art C compiler for VLIW architecture)
- Texas Instruments low-overhead DSP-BIOS operating system

---

**NOTE:** IVA2.2 is not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

---

### 1.3.3 On-Chip Memory

On-chip memory configuration offers memory resources for program and data storage:

- 112KB ROM
- 64KB single-access static random access memory (SRAM)

### 1.3.4 External Memory Interfaces

The device includes two external memory interfaces supporting the stacking of a multichip memory package using the generic POP interface:

- General-purpose memory controller (GPMC)
  - NOR flash, NAND flash (with ECC Hamming code calculation), SRAM and Pseudo-SRAM asynchronous and synchronous protocols
  - Flexible asynchronous protocol control for external ASIC or peripheral interfacing
  - 16-bit data, up to 8 chip-selects (CSs)
  - 128M-byte addressable per chip-select, 1G-byte total address space
  - Nonmultiplexed device with limited address (2K bytes)
- SDRAM controller (SDRC)
  - Mobile single data rate (M-SDR) SDRAM and low-power double data rate (LPDDR) SDRAM
  - 16-bit or 32-bit data, 2 chip-selects, configurations for a maximum of 1 G-byte address space per chip-select
  - Work in conjunction with the SDRAM memory scheduler (SMS) companion module

### 1.3.5 DMA Controllers

The device embeds one generic DMA controller, the system DMA (sDMA) controller, used for memory-to-memory, memory-to-peripheral, and peripheral-to-memory transfers:

- One read port, one write port
- 32 prioritizable logical channels
- 96 hardware requests
- 256 x 32-bit FIFO dynamically allocable between active channels

The device also embeds three dedicated DMA controllers: enhanced DMA (EDMA), which is embedded in the IVA2.2 subsystem, display DMA, and USB HS DMA.

### 1.3.6 Multimedia Accelerators

The device uses the following multimedia accelerators for display and gaming effects as well as high-end imaging and video applications:

- 2D and 3D graphics accelerator (SGX)
  - 2D and 3D graphics and video codecs supported on common hardware
  - Tile-based architecture
  - Universal scalable shader engine (USSE™) multithreaded engine incorporating pixel and vertex shader functionality reducing die area
  - Advanced shader feature set in excess of Microsoft VS3.0, PS3.0, and OGL2.0
  - Industry standard API support Direct3D mobile, OGL-ES 1.1 and 2.0, OpenVG 1.0, OpenMax
  - Fine-grained task switching, load balancing, and power management
  - Programmable high-quality image anti-aliasing
  - Advanced geometry DMA driven operation for minimum CPU interaction
  - Fully virtualized memory addressing for OS operation in a unified memory architecture
  - Advanced and standard 2D operations (that is, vector graphics, BLTs, ROPs, etc.)
  - Programmable video encode and decode support for H.264, H.263, MPEG4 (SP), WMV9, and JPEG

---

**NOTE:** Multimedia accelerators are not available on all devices. See [Section 1.5, OMAP35x Family](#), for more information on available features.

---

- Camera interface
  - Supports most of the raw image sensors available in the market
  - Includes video processing hardware
  - 12-bit parallel interface supported
  - Pixel clock up to 83 MHz

#### CAUTION

Clock configurations depend on the core voltage and maximum clock frequencies. Values in this document might not apply to production devices. Refer to your device-specific data manual for supported values for production devices.

- Display interface
  - Display controller
  - Color and monochrome displays up to 2048 x 2048 x 24-bpp resolution
  - 256 x 24-bit entries palette in red, green, blue (RGB)
  - 3,375 colors, 15 grayscales
  - Picture-in-picture (overlay), color-space conversion, rotation, color-phase rotation, and resizing support

- Remote frame buffer interface
- Liquid-crystal display (LCD) pixel interfaces (MIPI DPI 1.0) and LCD bus interfaces (MIPI DBI 1.0) supported
- NTSC/PAL video encoder outputs with integrated digital-to-analog converters (DACs) output are supported on CVBS and S-video TV analog output signals
- Serial display interface implements high-speed differential output buffers to support FlatLink3G™, Mobile CMADS and MIPI DSI 1.0 formats
- Embedded DMA controller

### 1.3.7 Security (HS Devices Only)

The secure firmware resides in a secure version of the ROM and includes hardware security features that enable HS devices and the following encryption/decryption accelerators:

- RNG
- 2 x DES/3DES
- SHA1/MD5
- SHA2/MD5
- 2 x AES with counter mode
- Fast PKA

The customer programmable fuse ROM (CPFROM) module is only available on high-security (HS) devices.

The universal subscriber identity module (USIM) that supports 3GPP extended features and EMV specific feature is available only on HS devices. This interface includes two modules: the fast-deactivate (FD) module and the USIM.

---

**NOTE:** This technical reference manual focuses only on general-purpose (GP) devices. To determine if a high-security (HS) version of your device is available and for more information on HS devices, see [Section 1.5](#), *OMAP35x Family*, and your device-specific data manual.

---

### 1.3.8 Comprehensive Power Management

OMAP35x devices include the following power management features:

- Clock and reset generation and distribution
- Wake-up event management
- SmartReflex™ technology
- Dynamic voltage frequency shifting
- Dynamic power shifting
- Static leakage management

### 1.3.9 Peripherals

The device supports a comprehensive set of peripherals to provide flexible and high-speed interfacing and on-chip programming resources. [Table 1-1](#) provides a list and description of the peripherals available on OMAP35x devices.

**Table 1-1. OMAP35x Peripherals**

Type	Name	Number	Description
Serial Communication	Multi-channel Buffered Serial Ports (McBSPs)	5	The McBSPs provide a full-duplex direct serial interface between the device and other devices in a system such as audio and voice codecs and other application chips. McBSP1, McBSP2, and McBSP3 serve as general purpose serial ports while McBSP2 and McBSP3 include additional audio-loopback capability.
	Multi-channel Serial Port Interface (McSPI)	4	The McSPIs provide a master/slave interface to SPI devices.
	High-speed Multi-port USB Host Controller	1	High-speed USB2.0 host controller with three host ports each offering high-speed data transactions (up to 480 Mbps) or full-speed/low-speed data transactions (12 and 1.5 Mbps, respectively). In high-speed mode, the USB host controller ports interface to external USB PHYs using a 12-pin or 8-pin UTMI low pin interface (ULPI). In full-speed and low-speed mode, the ports interface to external USB PHYs using a 6-/4-/3-pin serial interface. Additionally each port can be directly connected to a USB device (bypassing the need for USB PHY) by using an the on-chip transceiver-less link logic (TLL) adapter.
	High-speed USB OTG Controller	1	High-speed USB2.0 OTG controller that offers high-speed data transactions (up to 480 Mbps) on a USB port with embedded DMA controller. The high-speed USB OTG controller interfaces to an external USB PHY using a 12-pin UTMI low pin interface (ULPI).
	HDQ/1-Wire®	1	The HDQ/1-Wire interface supports the Benchmark HDQ protocol and the Dallas Semiconductor 1-Wire protocol.
	Universal Asynchronous Receiver/Transmitter (UART)	3	Serial communication interfaces compatible to the industry standard TL16C550 asynchronous communications element. UART1 and UART 2 are general serial communication interfaces. UART3 provides additional support for infrared data association (IrDA) and consumer infrared (CIR) communications.
	High-speed (HS) Inter-integrated Circuit (I2C) Controllers	3 <sup>(1)</sup>	Master/slave I2C high-speed standard interfaces with support for standard mode (up to 100K bits/s), fast mode (up to 400K bits/s), and high-speed mode (up to 3.4M bits/s).
Removable Media	Multimedia Card/Secure Digital/Secure Digital I/O (MMC/SDIO) Card Interface	1	MMC memory card, SD memory card, or SDIO cards interface.
Miscellaneous	GP timers	12	Twelve general-purpose timers
	Watchdog timers (WDTs)	2	Three watchdog timers
	32-kHz synchronization timer	1	32-kHz clock timer
	General-purpose input/output (GPIO)	Package-specific	General-purpose input/output pins controlled by six GPIO controllers.
	Mailbox	6	MPU/IVA2.2 inter-processor communications mailboxes. All six mailboxes are available in chassis mode, however, only two mailboxes are available in stand-alone mode.
	Control module	1	I/O multiplexing and chip-configuration control.
Security Modules (High-security Devices Only)			RNG, Fast PKA, 2xDES/3DES, SHA1/MD5, SHA2/MD5, 2xAES, Secure Watchdog Timer, and universal subscriber identity module (USIM).

<sup>(1)</sup> A fourth master/transmitter high-speed I2C interface (I2C4) is included in the power, reset, and clock management (PRCM) module to perform dynamic voltage control and power sequencing.

### 1.4 Package-On-Package Concept

The OMAP35x CBB package provides a package-on-package (POP) memory interface to support multiple stacked package configurations, including a flash multi-chip package, depending on customer needs. Note that use of standalone memory devices is also possible on the CBB package; use of POP technology is not required.

The stacked memory package is directly connected to the two memory interfaces (GPMC and SDRC) of the OMAP35x CBB package through the POP interface present at the top. For more information on the interconnect between the stacked memory package and the OMAP35x CBB package, see Chapter 11, Memory Subsystem, and your device-specific OMAP35x data manual.

**NOTE:** Before using the POP memory interface, a compatible memory device supply must first be secured directly from specific memory vendors.

Figure 1-4 shows the concept of the POP solution, and Figure 1-5 shows stacked memory package on the POP device.

**Figure 1-4. POP Concept (CBB Package)**

108-003

**Figure 1-5. Stacked Memory Package on the POP Device (CBB Package)**

108-004

The memory interfaces should be correctly configured based on the memory package used with the POP device.

Table 1-2 summarizes the supported configurations with the generic POP interface.

**NOTE:** Use of standalone memory devices is also possible on the CBB package; use of POP technology is not required.

**Table 1-2. Summary of Memories Supported by the POP Interface**

Generic POP Interface Features Set	SDRC Interface	GPMC Interface
Type of memory supported	MDDR	NOR flash asynchronous and synchronous burst flash NAND flash "CE don't care" One NAND on CS0 and CS1 NOR flash address/data nonmultiplexed is not supported.
Number of chip-selects	2	2
Maximum density per chip-select	2G bits	1G bit NOR flash
Maximum size per interface	4G bits	2G bits NOR flash
Interface width	X 32 bits	X 16 bits
I/O voltage	1.8 V LVCMOS	1.8 V LVCMOS

For more information on the memory interface configuration, see the *Memory Subsystem* chapter.

The POP device includes feedthroughs in addition to the GPMC and SDRC interfaces positioned at the top of the package. Up to 47 feedthroughs are defined from the bottom ball-grid array (BGA) to the top (or POP) interface to support different memory combinations.

The feedthroughs either provide power to a top memory device or provide specific memory signals (for example, control and/or address signals) from the bottom BGA to the POP interface.

**NOTE:** It is possible to monitor the DDR SDRAM temperature if the memory multichip package allows the temperature sensing option. A feedthrough is used to lower the temperature sensing dedicated signal to make a connection with a GPIO. For more information on DDR SDRAM temperature sensing management, see the *Memory Subsystem* and the *General-Purpose Interface* chapters.

Figure 1-6 shows the implementation of feedthroughs on the POP and the different paths between the bottom and the top of the package.

**Figure 1-6. Stacked Memory Package on the POP Device (CBB Package)**

108-005

- (1) Path 1: feedthrough only; Path 2: all but feedthrough; Path 3: POP interface (SDRC + subset GPMC)
- (2) Any signal available on the POP interface to a top-side ball is also available to a bottom-side ball.

## 1.5 OMAP35x Family

### 1.5.1 Device Features

The OMAP 3 architecture is configured with different sets of features in different devices. This technical reference manual details all of the features available in current and future OMAP35x devices. Some features may not be available or supported in your particular device. The features supported across different OMAP35x devices are shown on [Table 1-3](#) (CBB and CBC packages) and [Table 1-4](#) (CUS package). For more information on the CBB, CBC, and CUS packages, refer to your device-specific data manual.

**Table 1-3. Subsystem, Co-Processor, and Peripheral Support on OMAP35x Devices (CBB and CBC Packages)**

### 1.5.2 Device Identification

The identification registers include the CONTROL\_IDCODE and CONTROL\_DIE\_ID data registers. These registers are accessible through the L4 interconnect port starting at physical address 0x4830 A204 and 0x4830 A218, respectively. See the Memory Mapping chapter for more information about the L4 memory space mapping. [Table 1-6](#) describes the identification registers.

The silicon type can be read in the HAWKEYE bit field value of the CONTROL.CONTROL\_IDCODE register. The silicon revision can be read in the VERSION bit field value of the CONTROL.CONTROL\_IDCODE register.

**Table 1-6. Device Identification Registers**

Register Name	Address	Size
CONTROL.CONTROL_IDCODE[31:0]	0x4830 A204	32
CONTROL.CONTROL_DIE_ID[127:0]	0x4830 A218	128

To retrieve OMAP35x chip identification, see [Table 1-7](#). This register helps software identify chip derivative.

**Table 1-7. Chip Identification**

Scalable Resource	Name	Bit	Value	Description	OMAP3530	OMAP3525	OMAP3515	OMAP3503

ES2.1	CONTROL.CONTROL_PRODUCTION_ID[127:96]	0xCAFE7AE
ES3.0	CONTROL.CONTROL_PRODUCTION_ID[127:96]	0xCAFE7AE

**Table 1-12. CONTROL\_DIE\_ID**

Field	Bits	Value
DIE_ID[127:0]	RESERVED	Single identifier

### 1.5.2.1 720MHz Device Identification

Read device ID to be able to identify if this device is 720MHz capable or not. There is SKU ID that is blown in efuse and that it readable from following the memory location.

#### Register 0x4830A20C [ProdID.SKUID] [0:3]:

- 0x0 for normal 600/430MHz device.
- 0x8 for 720/520MHz device.

#### 1.5.2.1.1 Procedure for Calculation of SmartReflex nValue for OPP6

Read OPP5 nTargetvalue from Efuse register.

```
opp5nValue = Read32(0x48002390);
```

- Extract SenPGain, SenNGain, SenPRN, SenNRN values

```
SenPGain_fuse = (opp5nValue & 0x00F00000) >> 0x14
```

```
SenNGain_fuse = (opp5nValue & 0x000F0000) >> 0x10
```

```
SenPRN_fuse = (opp5nValue & 0x0000FF00) >> 0x08
```

```
SenNRN_fuse = (opp5nValue & 0x000000FF)
```

Use following Delta NNT & PNT target values for following calculation:

```
DELTA NNT = +379
```

```
DELTA PNT = +227
```

Calculate Adjusted SenPGain, SenNGain, SenPRN, SenNRN as shown below:

```
function [Radj, Gainadj] = CaluclateRG(RFuse, gainFuse, DeltaNT)
{
    Nadj=2^(GainFuse+8)/RFuse+DeltaNT
    for (G=0: G < 16; G ++ )
    {
        R=(1/Nadj)*2^(G+8);
        if (R < 256) then
        {
            Radj=R;
            Gainadj=G;
        }
    }
}
[SenNRN, SenNGain]=CalculateRG(SenNRN_fuse, SenNgain_fuse, DeltaNNT]
[SenPRN, SenPGain]=calculateRG(SenPRN_fuse, SenPGain_fuse, DeltaPNT]
```

Formulate OPP6 values using following formula:

```
Opp6nValue = (SenPGain << 0x14) | (SenNGain << 0x10) | (SenPRN << 0x08) | (SenNRN)
```

### 1.5.3 General Recommendations Relative to Unavailable Features/Modules

As explained in the previous section, some features are not available in all OMAP35x devices. For unavailable features, use the following recommendations:

- Memory mapping: Memory area of unavailable modules and features are RESERVED, read is undefined, and write can lead to unpredictable behavior.
- Interrupt controllers: Ensure that interrupts of unavailable modules and features are masked in MPU/IVA subsystems.
- DMA: Ensure that DMA requests of unavailable modules and features are masked in DMA subsystems.
- System Control Module (SCM): Unavailable modules and feature pins are not functional and should not be used.
- Power, Reset, and Clock Management Module (PRCM): For power management and power-saving consideration, ensure that power domains of unavailable features/modules are switched off and clocks are cut off.
- Interconnect: To flag potential interconnect outstanding commands, the time-out of target agents

attached to unavailable modules can be enabled with the lowest setting.

## 1.6 Revision History

[Table 1-13](#) lists the changes made since the previous version of this document.

**Table 1-13. Document Revision History**

<b>Reference</b>	<b>Additions/Modifications/Deletions</b>
<a href="#">Section 1.1.1</a>	Added subsection.
<a href="#">Table 1-2</a>	Changed SDRC Interface and GPMC Interface values for rows 3 and 4.
<a href="#">Table 1-5</a>	Added table.

## Memory Mapping

---

---

This chapter describes the memory mapping.

---

**NOTE:** This chapter gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

Topic	Page
<b>2.1 Introduction</b> .....	<b>176</b>
<b>2.2 Global Memory Space Mapping</b> .....	<b>178</b>
<b>2.3 L3 and L4 Memory Space Mapping</b> .....	<b>181</b>
<b>2.4 IVA2.2 Subsystem Memory Space Mapping</b> .....	<b>189</b>
<b>2.5 Revision History</b> .....	<b>196</b>

## 2.1 Introduction

The microprocessor unit (MPU) has a 32-bit address port, allowing it to handle a 4Gbytes space divided into several regions, depending on the target type.

The memory map is composed of a memory space (general-purpose memory controller [GPMC], SDRAM controller [SDRC], etc.), register space (L3 and L4 interconnects), and dedicated spaces (IVA2.2 subsystem, SGX, etc.), all of which are shared among the initiators (for example, the MPU subsystem or the IVA2.2 subsystem).

The GPMC and SDRC are dedicated to memory connection. The GPMC is used for NOR/NAND flash and SRAM memories. The SDRC is used for Low-Power DDR (LPDDR) SDRAM. For more information, see the *Memory Subsystem* chapter.

The L3 interconnect allows the sharing of resources, such as peripherals and external or on-chip memories, between all the initiators of the platform. The L4 interconnects control access to the peripherals.

Transfers between initiators and targets across the platform are physically conditioned by the chip interconnect and can be logically conditioned by firewalls. See the *Interconnect* chapter for more information about the intercommunication (L3 and L4 interconnects) and protection mechanisms implemented in the device.

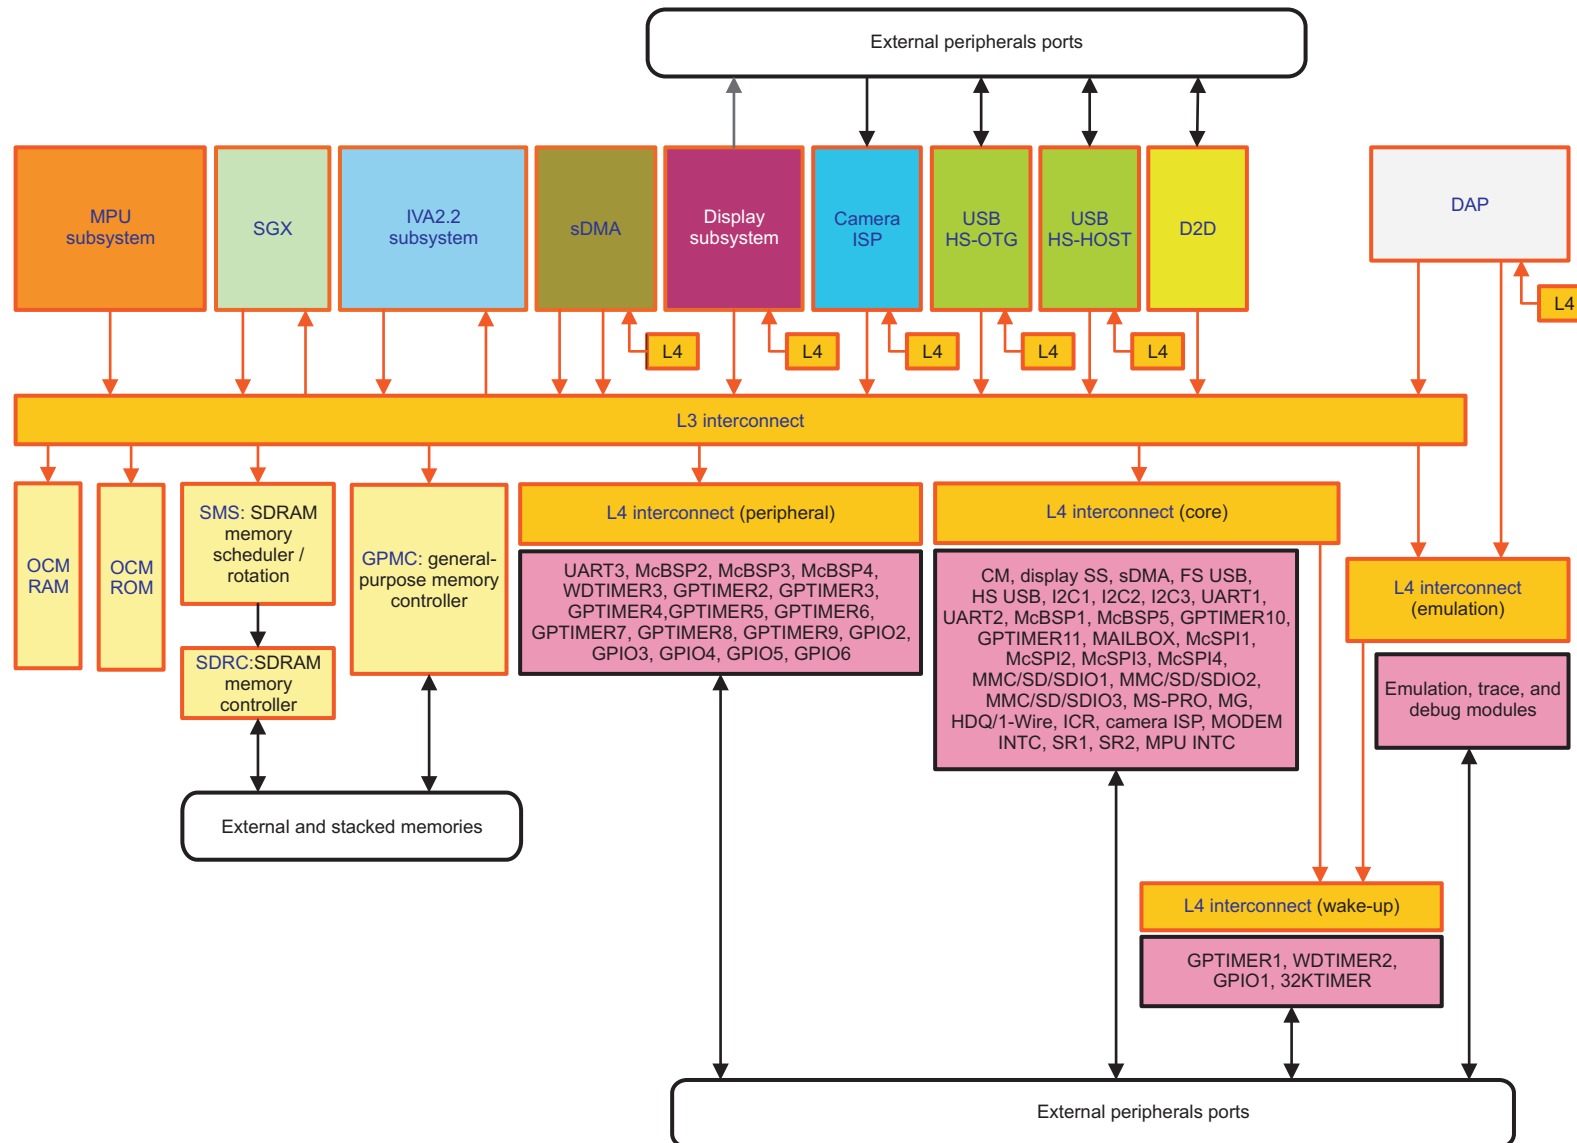

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

[Figure 2-1](#) shows the interconnect of the device and the main modules and subsystems in the platform.

Figure 2-1. Interconnect Overview

## 2.2 Global Memory Space Mapping

This section provides a global view of the memory mapping and details the boot, GPMC, SDRC, and virtual rotated frame buffer (VRFB) memory spaces.

The system memory mapping is flexible, with two levels of granularity for target address space allocation:

- Level 1: Four quarters are labeled Q0, Q1, Q2, and Q3. Each quarter corresponds to a 1Gbyte address space (total address space is 4Gbytes).
- Level 2: Each quarter is divided into eight blocks of 128Mbytes, with target spaces mapped inside the blocks.

This organization allows all target spaces to be decoded based on the five most significant bits (MSBs) of the 32-bit address ([31:27]).

- **Boot space**

The system has a 1Mbyte boot space either in the on-chip boot ROM or on the GPMC memory space. When booting from the on-chip ROM with the appropriate external `sys_boot5` pin configuration, the 1Mbyte memory space is redirected to the on-chip boot ROM memory address space [0x4000 0000 – 0x400F FFFF].

When booting from the GPMC with the appropriate external `sys_boot5` pin configuration, the memory space is part of the GPMC memory space.

For more information on `sys_boot5` pin configuration, see the *Memory Subsystem* and the *Initialization* chapters.

- **GPMC space**

Eight independent GPMC chip-selects (`gpmc_ncs0` to `gpmc_ncs7`) are available in the first quarter (Q0) of the addressing space to access NOR/NAND flash and SRAM memories. The chip-selects have a programmable start address and programmable size (16Mbytes, 32Mbytes, 64Mbytes, or 128Mbytes) in a total memory space of 1Gbyte.

- **SDRC space**

Two SDRC chip-selects (`sdrc_ncs0` and `sdrc_ncs1`) are available on the third quarter (Q2) of the addressing space to access SDRAM memories. The chip-selects have a programmable size (64Mbytes, 128Mbytes, 256Mbytes, or 512Mbytes) in a total memory space of 1Gbyte.

The base address of the chip-select 0 (`sdrc_ncs0`) memory space is always 0x8000 0000. The base address of the chip-select 1 (`sdrc_ncs1`) memory space is programmable. The default value after reset is 0xA000 0000.

- **VRFB space**

The SDRC-SMS virtual memory space is a different memory space used to access a subset of the SDRC memory space through the rotation engine. The virtual address space size is 768Mbytes split into two parts: The first 256M-byte part is in the second quarter (Q1) of the memory; the second 512Mbytes part is in the fourth quarter (Q3) of the memory.

For more information on boot, GPMC, SDRC, and VRFB, see the *Memory Subsystem* chapter.

This section gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

[Table 2-1](#) describes the global memory space mapping.

**Table 2-1. Global Memory Space Mapping**

<sup>(5)</sup> Chip-select 0 and chip-select 1 spaces are configurable within the 1GB SDRC / SMS space. However, the base address for chip-select 0 cannot be configured and is always 0x8000 0000.

## 2.3 L3 and L4 Memory Space Mapping

The memory space system is defined from a hierarchical view: L1, L2, L3, and L4.

L1 and L2 are memories included in the MPU and the imaging video and audio (IVA2.2) subsystems.

The chip-level interconnect, which is made of one L3 and four L4s, enables communication between all modules and subsystems.

L3 handles many types of data transfers and, in particular, the data exchange with system on-chip/external memories.

The four L4s handle transfers with peripherals but are in four distinct power domains: the L4-Core, L4-Wakeup, L4-Per, and L4-Emu interconnects, which are in the CORE, WAKEUP, PER, and EMU power domains, respectively.

For more information about the interconnect, see the *Interconnect* chapter.

The following sections describe the register mapping of the L3 and L4 interconnects. The software configures these registers.

### 2.3.1 L3 Memory Space Mapping

The L3 interconnect control registers are mapped in a 16Mbytes space and allow the configuration of the L3 interconnect parameters.

The L3 default settings are fully functional and enable all possible functional data paths. However, the interconnect parameters can be changed to accommodate expectations.

Accesses to the L3 interconnect can be configured on a per-module basis using the internal L3 registers, which are grouped into five register block types:

- IA: initiator agent configuration registers
- TA: target agent configuration registers
- RT: register target (global configuration registers)
- PM: protection mechanism (firewalls) configuration registers
- SI: global sideband signal configuration registers

For more information, see the *Interconnect* chapter.

This section gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

Table 2-2 describes the mapping of the L3 interconnect control registers.

**Table 2-2. L3 Control Register Mapping**

### 2.3.2 L4 Memory Space Mapping

The device contains four L4 interconnects: the L4-Core, L4-Wakeup, L4-Per, and L4-Emu interconnects.

As with the L3 interconnect, the L4 interconnects can be configured to tune the access depending on the characteristics of each module.

For more information on the L4 interconnect, see the *Interconnect* chapter.

#### 2.3.2.1 L4-Core Memory Space Mapping

The L4-Core interconnect is a 16Mbytes space composed of the L4-Core interconnect configuration registers and the module registers.

Table 2-3 describes the mapping of the registers for the L4-Core interconnect.

---

**NOTE:** All memory spaces described as modules provide direct access to module registers outside the L4-Core interconnect. All other accesses are internal to the L4-Core interconnect.

---

This section gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

### 2.3.2.2 L4-Wakeup Memory Space Mapping

The L4-Wakeup interconnect is a 256Kbytes space composed of the L4-Wakeup interconnect configuration registers and the module registers.

[Table 2-4](#) describes the mapping of the registers for the L4-Wakeup interconnect.

**NOTE:** All memory spaces described as modules provide direct access to module registers outside the L4-Wakeup interconnect. All other accesses are internal to the L4-Wakeup interconnect.

**Table 2-4. L4-Wakeup Memory Space Mapping**

Device Name	Start Address (HEX)	End Address (HEX)	Size	Description

<sup>(1)</sup> These modules are accessed through the L4-Wakeup interconnect (for emulation purpose only).

<sup>(2)</sup> The registers mapped in this range are shadow registers of the first 2Kbytes region A [0x5470 6000 - 0x5470 67FF]. Region A and region B share the same port.

### 2.3.3 Register Access Restrictions

This section gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

Table 2-7 gives the supported data access widths per module.

**Table 2-7. Register Access Restrictions**

Module	Allowed Access
MPU subsystem	8-bit/16-bit/32-bit
IVA2.2 subsystem	32-bit
SGX	32-bit

SR	8-bit/16-bit/32-bit

## 2.4 IVA2.2 Subsystem Memory Space Mapping

This section gives information on hardware accelerators of IVA2.2. See Chapter 1, *Device Family* section, to check availability of modules. The memory area of unavailable modules and features is RESERVED, read is undefined, and write can lead to unpredictable behavior.

Some devices include the high-performance Texas Instruments IVA2.2. See the *IVA2.2 Subsystem* chapter for more information.

This section explains how the IVA2.2 internal memories and registers are accessed through the L3 interconnect and by the IVA2.2 internal initiators (that is, the digital signal processor [DSP] and the enhanced direct memory access [EDMA]).

Three views of the IVA2.2 subsystem memory space mapping are provided:

- L3 interconnect view: External view (subsystem memories and configuration registers) as seen by the MPU subsystem and most of the initiators of the platform through the L3 interconnect
- IVA2.2 DSP view: Internal view as seen by the DSP
- IVA2.2 EDMA view: Internal view as seen by the EDMA

---

**NOTE:** The IVA2.2 subsystem also contains a local interconnect with its own memory space mapping that can be accessed only by the DSP and the video accelerator and sequencer inside the IVA2.2 subsystem. For more information about this video accelerator/sequencer local interconnect and its memory space mapping, see the *IVA2.2 Subsystem* chapter.

---

## **2.4.1 IVA2.2 Subsystem Internal Memories and Cache Allocation**

### **2.4.1.1 IVA2.2 Subsystem Memory Hierarchy**

The IVA2.2 subsystem includes the following memory features:

- L1P (program)
  - 32Kbytes configurable: Memory-mapped (default after reset) or direct-mapped cache—32bytes cache line
- L1D (data)
  - 32Kbytes configurable: Memory-mapped (default after reset) or 2-way set associative cache—64bytes cache line
  - 48Kbytes memory-mapped
- L2 (program and data)
  - 64Kbytes configurable: Memory-mapped (default after reset) or 2-way set associative cache—128bytes cache line
  - 32Kbytes memory-mapped
  - 16Kbytes ROM

The local memories can be used as cache RAMs or memory-mapped RAMs, depending on the configuration of the different memory controllers in the IVA2.2 subsystem.

[Figure 2-2](#) shows the memory hierarchy of the IVA2.2 subsystem.

Figure 2-2. IVA2.2 Subsystem Memory Hierarchy

mmap-002

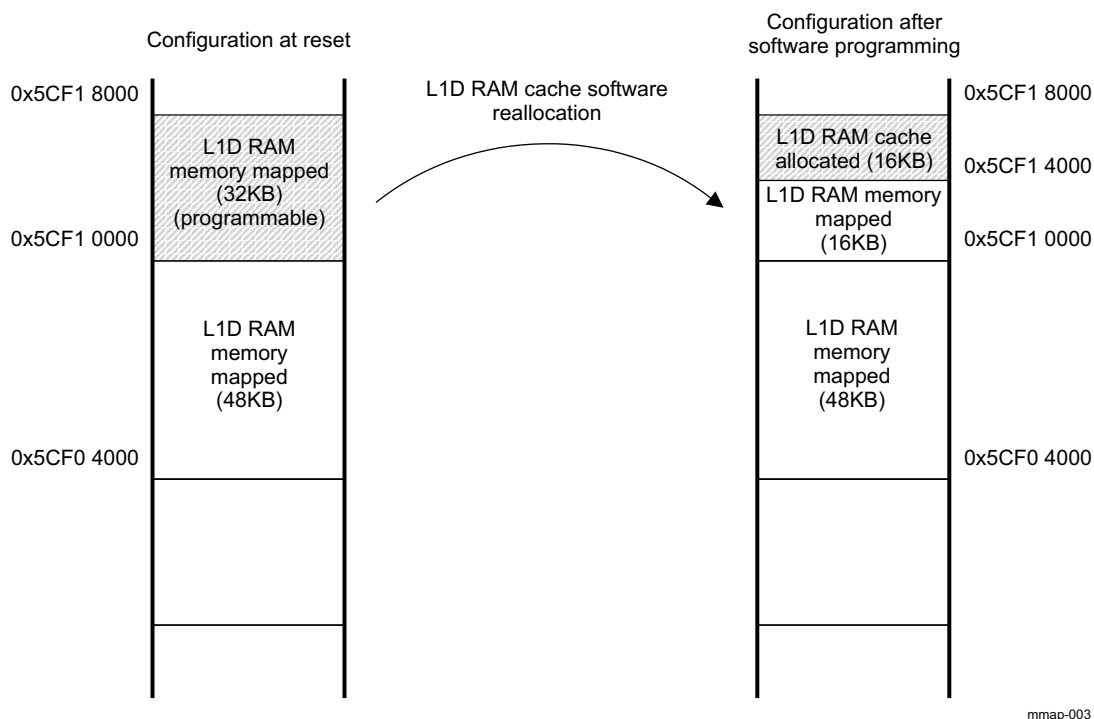

### 2.4.1.2 IVA2.2 Cache Allocation

After reset, the L1P RAM is used as a 32Kbytes memory-mapped RAM. The L1P RAM can be programmed in the GEM program memory controller to allocate 0Kbyte (default), 4Kbytes, 8Kbytes, 16Kbytes, or 32Kbytes to cache. When 32Kbytes are allocated to cache, there is no more memory-mapped L1P.

After reset, the L1D RAM is used as an 80Kbytes memory-mapped RAM. The L1D RAM can be programmed in the GEM data memory controller to allocate 0Kbyte (default), 4Kbytes, 8Kbytes, 16Kbytes, or 32Kbytes to cache. When 32Kbytes are allocated to cache, 48Kbytes are still allocated to the memory-mapped L1D.

After reset, the L2 is used as a 96Kbytes memory-mapped RAM. The L2 can be programmed to allocate 0Kbyte (default), 32Kbytes, or 64Kbytes to cache. When 64Kbytes are allocated to cache, 32Kbytes are still allocated to memory-mapped L2.

Figure 2-3 shows an example of the L1D RAM cache allocation, where 16Kbytes are allocated to cache.

**Figure 2-3. L1D RAM Cache Allocation Example (L3 Interconnect View)**

## 2.4.2 DSP Access to L2 Memories

### 2.4.2.1 DSP Access to L2 ROM

The IVA2.2 subsystem contains 16Kbytes of L2 ROM. The L2 ROM provides boot code.

When the L1P cache is configured to be inactive (default configuration), the DSP program fetch accesses to the L2 ROM are accomplished directly, and thus suffer the L2 latency.

When the L1P cache is configured to be active, the DSP program fetch accesses to L2 ROM are always serviced by the L1P cache controller, which partly hides the L2 latency.

### 2.4.2.2 DSP Access to L2 RAM

The IVA2.2 contains 96Kbytes of L2 RAM. The L2 RAM can be configured to allocate up to 64Kbytes to the L2 cache.

When the L1P and L1D caches are configured to be inactive (default configuration), the DSP accesses to the L2 RAM are accomplished directly and thus suffer the L2 latency.

When the L1P and L1D RAM are configured to be active, the DSP program accesses to L2 RAM are always serviced by the L1P cache controller (if code fetch) or the L1D cache controller (if data access), which partly hides the L2 latency.

## 2.4.3 DSP and EDMA Access to Memories and Peripherals

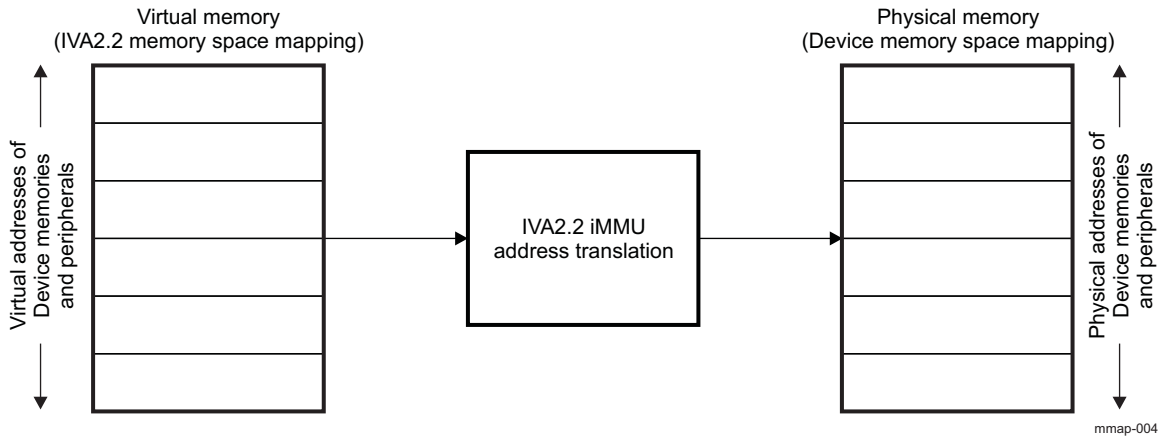

The IVA2.2 DSP and EDMA access the memories and peripherals using virtual addressing. This allows the DSP and EDMA to access memories and peripherals in the same contiguous view, even when the memory is physically segmented. [Table 2-9](#) and [Table 2-10](#) give the address range where the DSP and the EDMA can access the memories and peripherals, respectively.

The IVA2.2 memory management unit (IVA2.2 iMMU) handles the virtual to physical address translation based on the software configuration (typically under control of the MPU subsystem).

Virtual addresses are issued by the initiator to the IVA2.2 iMMU. Using the translation look-aside buffer (TLB), the MMU then translates the initiator virtual addresses into real physical addresses.

Figure 2-4 shows the relationship between physical addresses, virtual addresses, and the IVA2.2 iMMU.

**Figure 2-4. IVA2.2 iMMU Address Translation**

See the *Memory Management Units* chapter for more information on the MMU.

#### 2.4.4 L3 Interconnect View of the IVA2.2 Subsystem Memory Space

Table 2-8 lists the IVA2.2 subsystem memory space mapping from the perspective of the MPU subsystem through the L3 interconnect.

**Table 2-8. L3 Interconnect View of the IVA2.2 Subsystem Memory Space**

<b>3.5 Revision History .....</b>	<b>218</b>

## 3.1 MPU Subsystem Overview

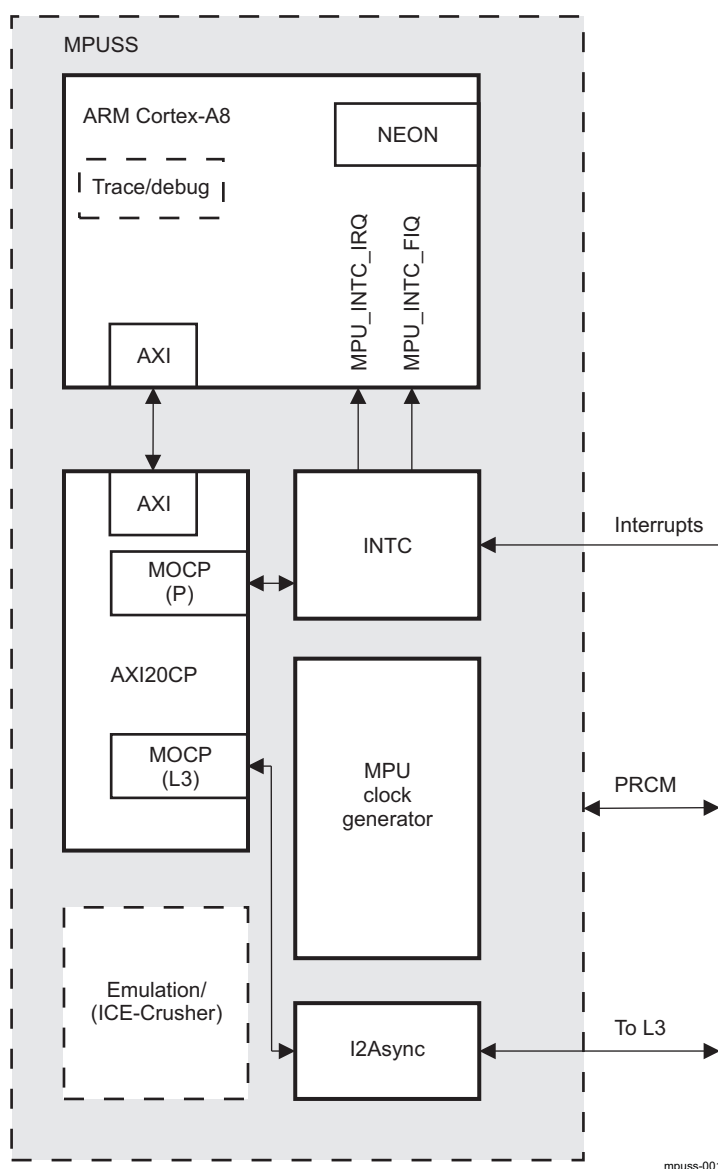

### 3.1.1 Introduction

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

The microprocessor unit (MPU) subsystem of the device handles transactions between the ARM core, the L3 interconnect, and the interrupt controller (INTC).

The MPU subsystem is a hard macro that integrates the ARM subchip with additional logic for protocol conversion, emulation, interrupt handling, and debug enhancements. Figure 3-1 shows the high-level block diagram of the MPU subsystem.

**Figure 3-1. MPU Subsystem Overview**

### 3.1.2 Features

The MPU subsystem integrates the following:

- ARM subchip
  - ARM® Cortex™-A8 core
  - ARM version 7 ISA: Standard ARM instruction set + Thumb®-2, Jazelle® RCT Java accelerator, and media extensions
  - NEON™ SIMD coprocessor (VFP light + media streaming instructions)
  - Cache memories
    - Level 1: 16KB instruction and 16KB data caches - 4 ways associative, 64 bytes/line
    - Level 2: See Chapter 1, *Device Family* section.
  - Emulation/debug
- Interrupt controller (INTC) of 96 synchronous interrupt lines (For details, see the *Interrupt Controller* chapter.)
- AXI2OCP bridge between ARM AXI bus, L3 master OCP bus, and interrupt controller master OCP bus
- MPU clock generator: Clock generation module that generate clocks, power modes, and idle and active acknowledge signals
- Debug, trace, and emulation features: ICE-Crusher, ETM, APB modules.
- I2Async bridge: An asynchronous bridge interface providing an asynchronous OCP to OCP interface.

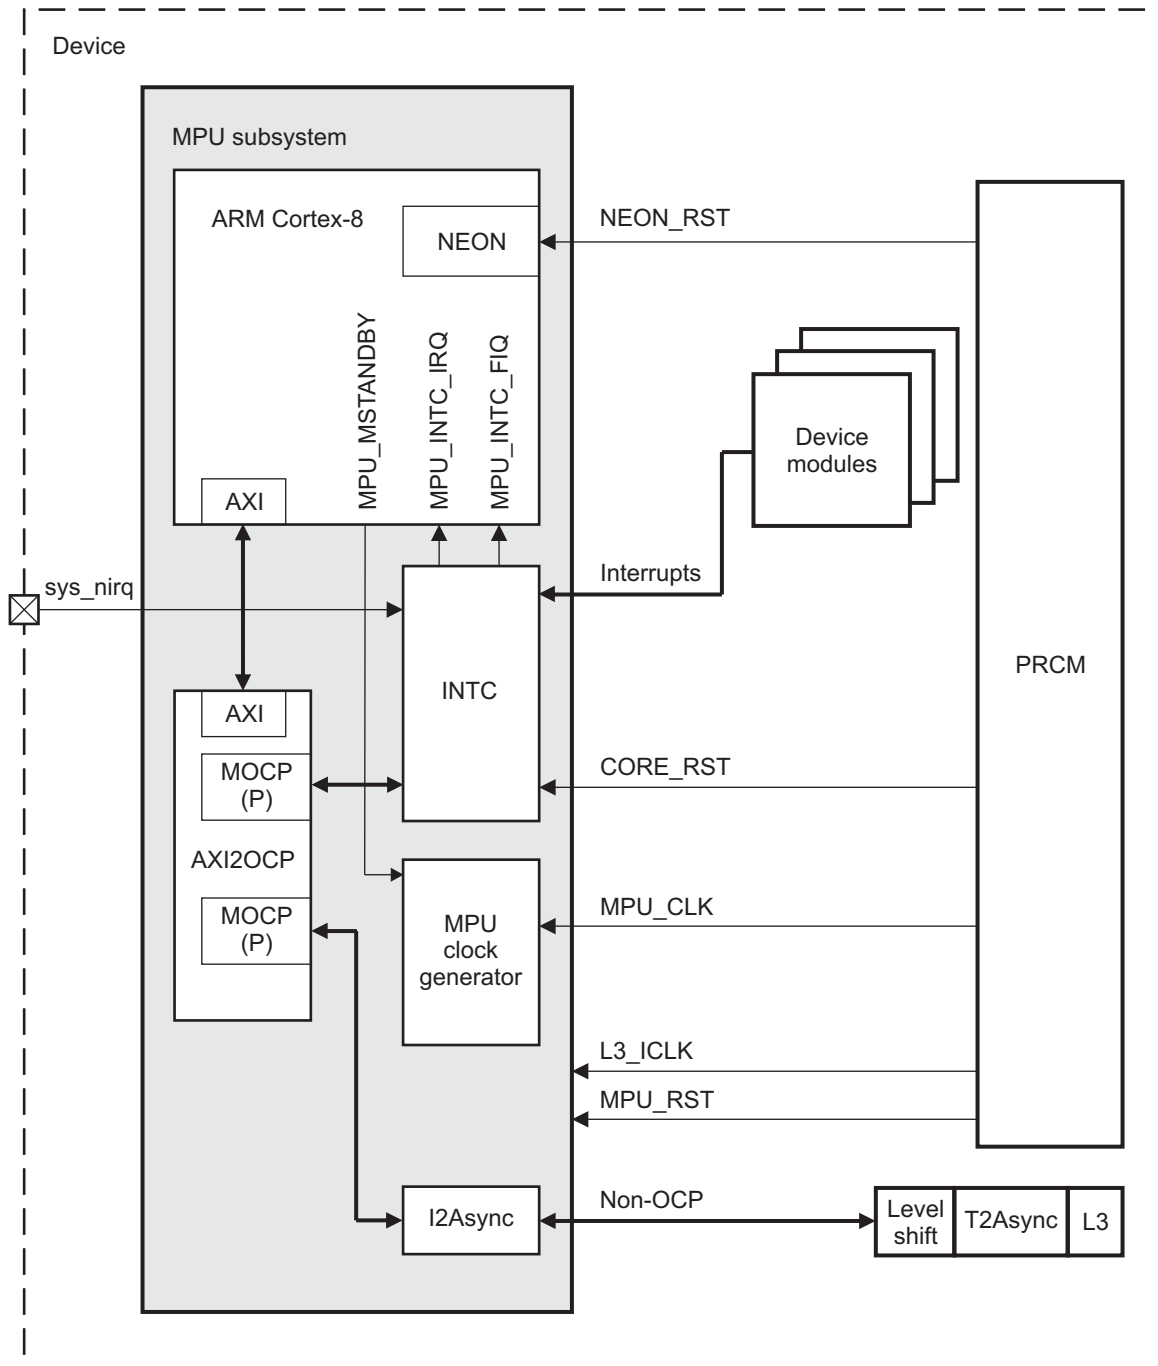

### 3.2 MPU Subsystem Integration

The MPU subsystem integrates the following group of submodules:

- ARM Cortex-A8: Provides a high processing capability, including the NEON technology for mobile multimedia acceleration. The ARM communicates through an AXI bus with the AXI2OCP bridge and receives interrupts from the MPU subsystem interrupt controller (MPU INTC).
- Interrupt controller: Handles the module interrupts (for details, see the *Interrupt Controller* chapter).
- AXI2OCP bridge: Allows communication between the ARM (AXI), the INTC (OCP), and the modules (OCP L3).
- I2Async bridge: An asynchronous bridge interface providing an asynchronous OCP to OCP interface. This interface is between the AXI2OCP bridge within the MPU subsystem and the T2Async bridge external to the MPU subsystem. The T2Async bridge connects to OCP L3.
- MPU clock generator: Provides clocks to internal modules of the MPU subsystem and is fed by the MPU DPLL of the power, reset, and clock management (PRCM) module of the device.

[Figure 3-2](#) shows the signals that interface with the external modules.

Figure 3-2. MPU Subsystem Integration Overview

108-002

**NOTE:** Some debug, trace, and emulation features are implemented in the MPU subsystem. This chapter includes only clock/reset inputs and power management aspects for these features.

### 3.2.1 MPU Subsystem Clock and Reset Distribution

#### 3.2.1.1 Clock Distribution

The MPU subsystem includes a clock generator block that supplies all the clocks for the modules inside the MPU subsystem. It is fed by the MPU\_CLK clock from PRCM.

All major modules inside the MPU subsystem are clocked at half the frequency of the ARM core. The divider of the output clock can be programmed with the PRCM.CM\_CLKSEL2\_PLL\_MPU[4:0]MPU\_DPLL\_CLKOUT\_DIV register field, the frequency is relative to the ARM core. For details see the *Power, Reset, and Clock Management (PRCM)* chapter. The clock generator generates the following functional clocks:

- **ARM (ARM\_FCLK):** This is the core clock. It is the base fast clock that is routed internally to the ARM logic and internal RAMs, including NEON, L2 cache, the ETM core (emulation), and the ARM core. It runs at one half the frequency of MPU\_CLK when DPLL1 is locked, and runs at the same frequency of MPU\_CLK when DPLL1 is bypassed.
- **AXI2OCP Clock (AXI\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). The OCP interface thus performs at one half the frequency of ARM.
- **Interrupt Controller Functional Clock (MPU\_INTC\_FCLK):** This clock, which is part of the INTC module, is half the frequency of the ARM clock (ARM\_FCLK).
- **ICE-Crusher Functional Clock (ICECRUSHER\_FCLK):** ICE-Crusher clocking operates on the APB interface, using the ARM core clocking. This clock is half the frequency of the ARM clock (ARM\_FCLK).
- **I2Async Clock (I2ASYNC\_FCLK):** This clock is half the frequency of the ARM clock (ARM\_FCLK). It matches the OCP interface of the AXI2OCP bridge.

**NOTE:** The second half of the asynchronous bridge (T2ASYNC) is clocked directly by the PRCM with the core clock. T2ASYNC is not part of the MPU subsystem.

**Emulation Clocking:** Except for the ICE-Crusher functional clock, which is provided by the MPU DLL, the emulation modules inside the MPU subsystem are not generated by the MPU subsystem DPLL, but by an EMU DPLL. These clocks (EMU\_CLOCKS) are distributed by the PRCM module, are asynchronous to the ARM core clock (ARM\_FCLK) and can run at a maximum of 1/3 the ARM core clock.

Figure 3-3 shows the MPU subsystem clocking scheme.

**Figure 3-3. MPU Subsystem Clocking Scheme**

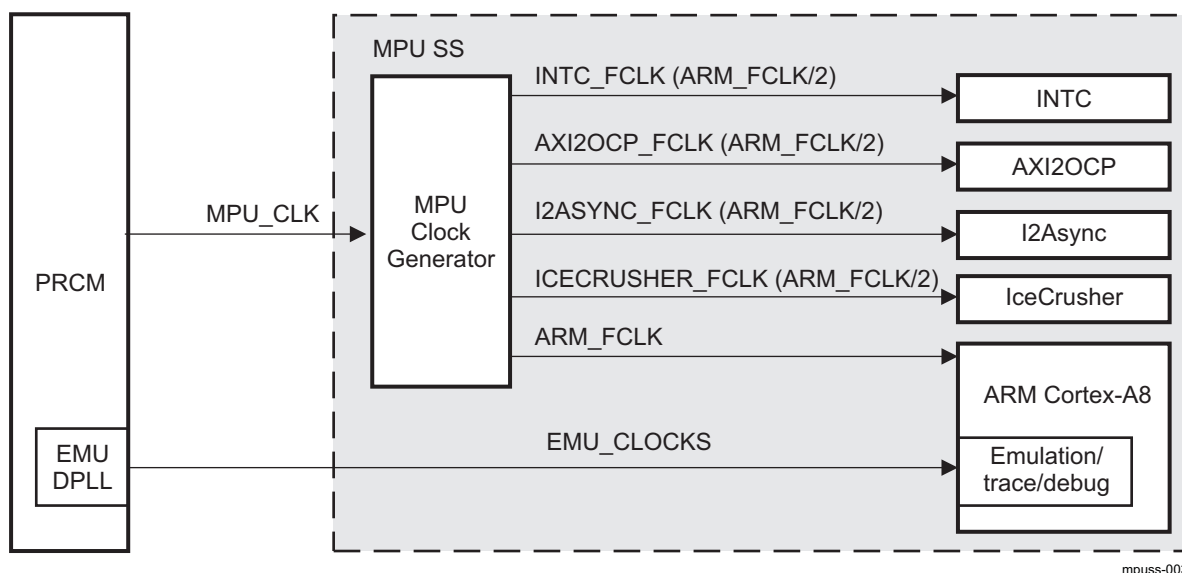

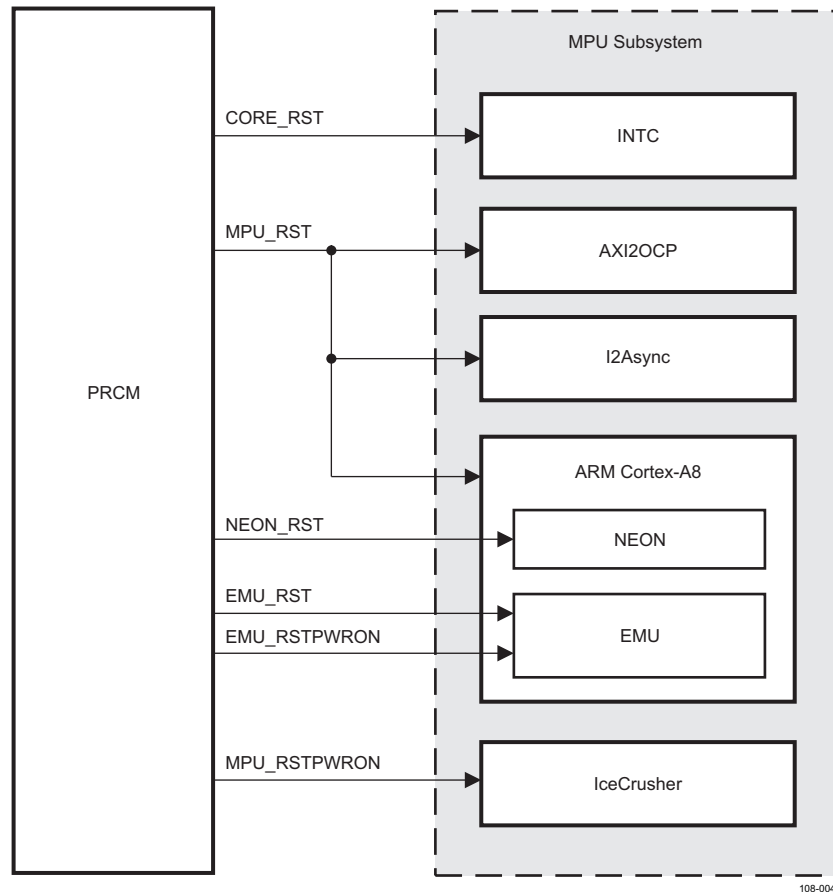

Table 3-1 summarizes the clocks generated in the MPU subsystem by the MPU clock generator.

**Table 3-1. MPU Clock Generator Clock Signals**

Signal Name	I/O	Interface	Comments
MPU_CLK	I	PRCM	MPU DPLL clock out
ARM_FCLK	O	ARM	ARM functional clock
MPU_INTC_FCLK	O	MPU INTC	MPU INTC functional clock
I2ASYNC_FCLK	O	I2Async	I2Async functional clock
AXI_FCLK	O	AXI2OCP	AXI2OCP functional clock
ICECRUSHER_FCLK	O	ICE-Crusher	ICE-Crusher functional clock

### 3.2.1.2 Reset Distribution

Resets to the MPU subsystem are provided by the PRCM and controlled by the clock generator module. There are as many reset signals as power domains. For details about power domains, see [Section 3.3.2.1](#). [Figure 3-4](#) shows the reset scheme of the MPU subsystem.

**Figure 3-4. MPU Subsystem Reset Scheme**

**Table 3-2. MPU Subsystem Reset Signals**

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset
NEON_RST	I	PRCM	NEON power domain reset
CORE_RST	I	PRCM	CORE power domain reset
MPU_RSTPWRON	I	PRCM	ICE-Crusher reset. It is active upon a cold reset only
EMU_RST	I	PRCM	Emulation interconnect reset
EMU_RSTPWRON	I	PRCM	Emulation modules reset

---

For details about clocks, resets, and power domains, see the *Power, Reset, and Clock Management (PRCM)* chapter.

## **3.2.2 ARM Subchip**

### **3.2.2.1 ARM Overview**

The ARM Cortex-A8 processor incorporates the technologies available in the ARM7™ architecture. These technologies include NEON™ for media and signal processing and Jazelle™ RCT for acceleration of realtime compilers, Thumb®-2 technology for code density and the VFPv3 floating point architecture.

For details, see the *ARM® Cortex™-A8 Technical Reference Manual*.

### 3.2.2.2 ARM Description

#### 3.2.2.2.1 ARM® Cortex™-A8 Instruction, Data, and Private Peripheral Port

The AXI bus interface is the main interface to the ARM system bus. It performs L2 cache fills and non-cacheable accesses for both instructions and data. The AXI interface supports 64-bit wide input and output data buses. It supports multiple outstanding requests on the AXI bus and a wide range of bus clock to core clock ratios. The bus clock is synchronous with the core clock.

See the *ARM® Cortex™-A8 Technical Reference Manual* for a complete programming model of the transaction rules (ordering, posting, and pipeline synchronization) that are applied depending on the memory region attribute associated with the transaction destination address.

#### 3.2.2.2.2 MPU Subsystem Features

[Table 3-3](#) is a list of main functionalities of the ARM core supported inside the MPU subsystem for the device. The MPU subsystem implements the ARM7™ Instruction Set Architecture.

**Table 3-3. ARM Core Key Features**

Feature	Comment
ARM version 7 ISA	Standard ARM instruction set + Thumb-2, Jazelle RCT Java accelerator, and Media extensions. Backward-compatible with previous ARM ISA versions.
L1 Icache and Dcache	16KB, 4-way, 64 byte cache line, and 128 bit interface. Note: L1 memories cannot be put into retention mode.
L2 Cache	The L2 cache and cache controller are embedded in the ARM core.
TLB	Fully associative and separate ITLB with 32 entries and DTLB with 32 entries
CoreSight ETM	The CoreSight ETM is embedded in the ARM core. The 4KB buffer (ETB) exists at the device level.
Branch target address cache	512 entries
Enhanced Memory Management Unit	Mapping sizes are 4KB, 64KB, 1MB, and 16MB. ARM MMU adds extended physical address ranges.
NEON	Enhances throughput for media workloads and VFP-Lite support
Tightly coupled memory	Not present
AXI Bus	Separate 64-bit input and 64-bit output data buses. ARM Cortex™-A8 Revision: r1p1 has a single AXI bus interface. The AXI interface is shared among Instruction fetches, data accesses, peripheral accesses and PLE (onchip preload engine, previously known as DMA) accesses. DMA is available.
Low interrupt latency	The IRQ & FIQ are directly connected to ARM and INTC is before L3
Vectored Interrupt Controller Port	Not used
JTAG based debug	Supported through DAP.
Trace support	Supported through TPIU.
External coprocessor	Not supported

For more information, see the *ARM® Cortex™-A8 Technical Reference Manual*.

### 3.2.2.3 Clock, Reset, and Power Management

#### 3.2.2.3.1 Clocks

Table 3-4 shows the ARM functional clock. For configuration, see the *Power, Reset, and Clock Management* chapter.

**Table 3-4. MPU Subsystem Clock Signal**

Signal Name	I/O	Interface	Comments
ARM_FCLK	I	MPU Clock Generator	Functional clock

#### 3.2.2.3.2 Reset

Table 3-5 lists the resets for the ARM. They include the power domains reset; NEON\_RST, which resets the neon module of the ARM subchip only; and MPU\_RST, which resets the rest of the ARM subchip and also the AXI2OCP and I2Async bridges.

**Table 3-5. ARM Reset Signals**

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset
NEON_RST	I	PRCM	Reset NEON only
EMU_RST	I	PRCM	Emulation interconnect reset
EMU_RSTPWRON	I	PRCM	Emulation modules reset

#### 3.2.2.3.3 Power Management

For details, see [Section 3.3.2](#).

### 3.2.3 AXI2OCP and I2Async Bridges

#### 3.2.3.1 Bridges Overview

The AXI2OCP bridge is used in the device design to connect the AXI bus on the ARM MPU to the OCP native L3 interconnect and interrupt controller. It converts between AXI and OCP protocols and maintains a mapping of AXI tags to the OCP thread ID. This bridge is responsible for some minimal address decoding to decide where to forward the requests between L3 and INTC.

Bridging to the L3 is accomplished through an asynchronous interface involving the I2Async and T2Async modules. The I2Async module inside the MPU subsystem has an OCP port that is asynchronously transferred to the T2Async module and routed to the L3. T2Async is outside the MPU subsystem.

---

**NOTE:** The interface between I2Async and T2Async is not an OCP protocol.

---

Figure 3-5 is an overview of the AXI2OCP and the L3 bridges.

**Figure 3-5. Bridges Overview**

mpuss-006

### 3.2.3.2 AXI2OCP Description

The AXI2OCP bridge key features are:

- Connection to the L3 interconnect through a 64-bit OCP port. Address bus is 32-bit.
- Connection to the interrupt controller through a 32-bit OCP port (only single transactions are supported)
- Support of single-request-multiple-data (data handshaking) burst mode to pipeline requests to L3. Bursts with width less than 64 bit are converted as single requests on L3. This could affect the system performance. INTC does not support burst transfers
- Support of multiple outstanding requests
- Remapping of the AXI tags to five OCP threads:
  - Instruction fetch (Thread\_IR)
  - Cacheable data read (Thread\_CR)
  - Cacheable data write (Thread\_CW)
  - Noncacheable data read (Thread\_DR)
  - Noncacheable data write (Thread\_DW)
- Interface to the L3 through the asynchronous bridge (I2Async)
- Security, emulation, and boot-mode translation support
- Translation of exclusive accesses to nonexclusive read/write in the bridge
- Boot mode address translation
- Force write nonposted support
- Debug related: Ready fail, force ready
- Interconnect attach neutralizer
- Narrow burst support
- Timeout counter for nonresponsive slaves on OCP

### 3.2.3.3 AXI Tag to OCP Thread Remapping

The tables below show the number of outstanding request per OCP thread and the mapping:

**Table 3-6. Maximum number of Outstanding Request per OCP Thread**

OCP Thread	Maximum Outstanding Requests
Thread_DR	1
Thread_DW	8
Thread_IR	1
Thread_CR	6
Thread_CW	4

**Table 3-7. AXI-Tag to OCP-Thread Remap Table**

ARID (ARVALID=1)	APROT[2]	Mthreadid (Encoding)	Outstanding Transactions
4'b0000-4'b0001, 4'b0110	x	Thread_DR (3)	2
4'b0011	x	Peripheral (na)	1
4'b0100-4'b0101, 4'b1111	x	Thread_IR (0)	1
4'b1110	x	Thread_CR (1)	5
4'b1000-4'b1011	0	Thread_CR (1)	5
4'b1000-4'b1011	1	Thread_IR (0)	1
AWID (AWVALID=1)	APROT[2]	Mthreadid (Encoding)	Outstanding Transactions
4'b0000-4'b0001	x	Thread_DW (4)	8
4'b0011	x	Peripheral (na)	1
4'b0010, 4'b1000-4'b1011	x	Thread_CW (2)	12

The following tags are never used for read channel (ARID): 0x2, 0x7, 0xC, 0xD.

The following tags are not used for write channel (AWID): 0x4-0x7, 0xC-0xF.

---

**NOTE:** For the AXITag ID in the range of 0x8-0xf, the ARM core does not use the same tag again when a request with that same tag ID is outstanding. This is to prevent out of order responses on Thread\_CR vs Thread\_IR when using APROT[2] to map AXITag ID 4'b1000-4'b101. Thus a response for two requests cannot come out of order.

---

A 2KB memory region within a 1MB memory space is reserved for an INTC. See [Table 3-8](#) for the memory map.

**Table 3-8. Memory Map for Interrupt Controller**

	Start	End	Size	Comments
Interrupt controller	0x4820 0000	0x4820 03FF	2K bytes	non shared device mapping
Reserved (alias to INTC)	0x4820 0400	0x4827 FFFF		non shared device mapping
Reserved	0x4828 0000	0x482F FFFF		non shared device mapping

### 3.2.3.4 Clocks, Reset, and Power Management

#### 3.2.3.4.1 Clocks

[Table 3-9](#) lists the bridge functional clocks.

**Table 3-9. Bridges Clock Signals**

Signal Name	I/O	Interface	Comments
AXI2OCP_FCLK	I	MPU Clock Generator	AXI2OCP functional clock
I2ASYNC_FCLK	I	MPU Clock Generator	I2Async functional clock

### 3.2.3.4.2 Reset

[Table 3-10](#) lists the bridge reset. It is a power domain reset that also resets the ARM.

**Table 3-10. MPU Subsystem Reset Signal**

Signal Name	I/O	Interface	Comments
MPU_RST	I	PRCM	MPU power domain reset

### 3.2.3.4.3 Power Management

For details, see [Section 3.3.2](#).

## 3.2.4 Interrupt Controller

For information, see the *Interrupt Controllers* chapter.

### 3.2.4.1 Clocks

[Table 3-11](#) lists the INTC clocks.

**Table 3-11. Bridge Clock Signals**

Signal Name	I/O	Interface	Comments
MPU_INTC_FCLK	I	MPU Clock Generator	INTC functional clock
MPU_INTC_ICLK	I	OCP Clock	INTC interface clock

### 3.2.4.2 Reset

[Table 3-12](#) lists the reset of the INTC. It is a power domain reset that also resets the whole core domain. For details, see the *Interrupt Controller* and the *Power, Reset, and Clock Management (PRCM)* chapters.

**Table 3-12. MPU Subsystem Reset Signal**

Signal Name	I/O	Interface	Comments
CORE_RST	I	PRCM	CORE power domain reset

### 3.2.4.3 Power Management

See the *Interrupt Controller* and the *PRCM* chapters.

### 3.3 MPU Subsystem Functional Description

#### 3.3.1 Interrupts

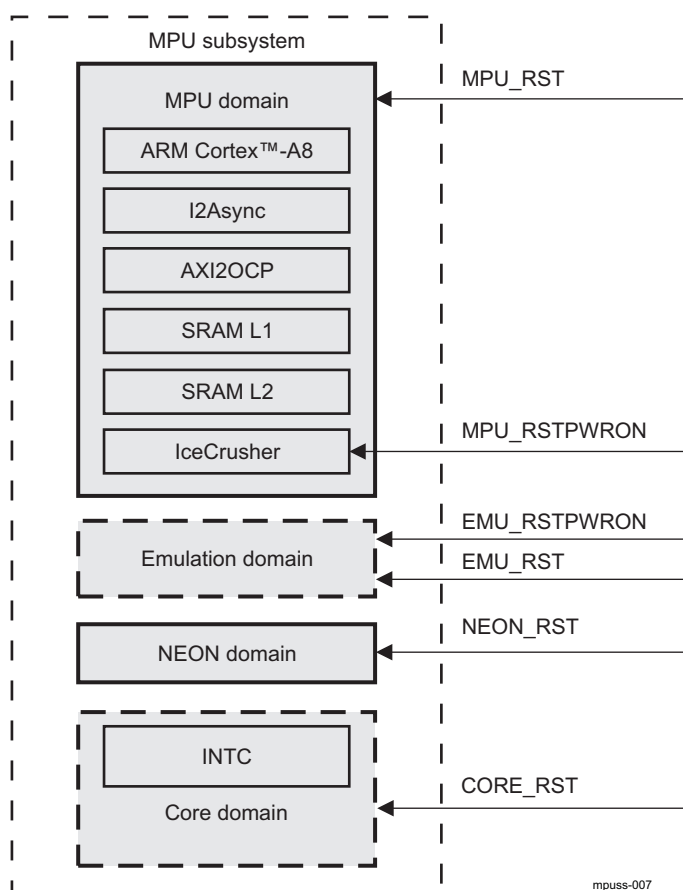

The MPU INTC is connected to the MPU through the AXI2OCP bridge. It runs at half-processor speed. The INTC prioritizes all service requests from the system peripherals and generates either an IRQ or an FIQ to the MPU, depending on the INTC programming. The INTC handles only the interrupts directed to the MPU subsystem. A maximum of 96 requests can be steered/prioritized as MPU FIQ or IRQ interrupt requests. For details, see the *Interrupt Controller* chapter.

#### 3.3.2 Power Management

##### 3.3.2.1 Power Domains

The MPU subsystem is divided into 5 power domains controlled by the PRCM, as shown in [Figure 3-6](#). Note that the emulation domain and the core domain are not fully embedded in MPU subsystem.

**Figure 3-6. MPU Subsystem Power Domain Overview**

Power management requirements at the device level govern power domains for the MPU subsystem.

The device-level power domains are directly aligned with voltage domains and thus can be represented as a cross reference to the different voltage domains. [Table 3-13](#) shows the different power domains of the MPU subsystem and the modules inside.

**Table 3-13. Overview of the MPU Subsystem Power Domain**

Functional Power Domain	Physical Power Domain per System/Module
MPU subsystem domain	ARM, AXI2OCP, I2Asynch Bridge, ARM L1 and L2 periphery logic and array, ICE-Crusher, ETM, APB modules
MPU NEON domain	ARM NEON accelerator
CORE domain	MPU interrupt controller
EMU domain	EMU (ETB,DAP)

**NOTE:** L1 and L2 array memories have separate control signals into the in MPU Subsystem, thus directly controlled by PRCM

For details on the physical power domains and the voltage domains, see the *Power, Reset, and Clock Management (PRCM)* chapter.

### 3.3.2.2 Power States

Each power domain can be driven by the PRCM in 4 different states, depending on the functional mode required by the user.

**Table 3-14. MPU Power States**

Power State	Logic Power	Memory Power	Clocks	Memory State Retention
Active	On	On or Off	On (at least one clock)	All
Inactive	On	On or Off	Off	All
Retention	On or Off	On or Off	Off (all clocks)	All or part
Off	Off	Off	Off (all clocks)	None

For each power domain the PRCM manages all transitions by controlling domain clocks, domain resets, domain logic power switches, memory power switches, and memory retention. The MPU DPLL then internally synchronizes the internal clocks, resets, and switches.

### 3.3.2.3 Power Modes

#### **MPU DPLL power modes:**

The PRCM.CM\_AUTOIDLE\_PLL\_MPU[2:0] AUTO\_MPU\_DPLL register field allows putting the MPU DPLL in an auto-idle mode when set to 0x1. In this mode, MPU DPLL is automatically put in low power stop mode when the MPU clock is not required anymore. It is also restarted automatically. The following table describes the different modes that the MPU DPLL can be used in auto-idle or manual mode. The manual modes (locked and low power bypass) can be configured by the PRCM.CM\_CLKEN\_PLL\_MPU[2:0] EN\_MPU\_DPLL register field. The status of the MPU DPLL clock activity can be checked with the PRCM.CM\_IDLEST\_PLL\_MPU[0] ST\_MPU\_CLK bit.

**Table 3-15. MPU DPLL Power Modes**

Mode	System Input Clock	Clock Output	DPLL Power State	Condition
Locked	ON	ON	ON	Software request (manual) or MPU wakes up (auto)
Low power bypass	ON	ON	ON	Software request (manual) or upon global reset release (auto)
Stop low power	OFF	OFF	ON	MPU is RET or OFF (auto)
OFF	OFF	OFF	OFF	Device is OFF (auto)

MPU DPLL power domain is switched off automatically by the PRCM only when the device enters OFF mode.

**MPU Subsystem power modes:**

The major part of the MPU subsystem belongs to the MPU power domain. The modules inside this power domain can be off at a time when the ARM processor is in an OFF or standby mode. IDLE/WAKEUP control is managed by the clock generator block but initiated by the PRCM module. The MPU Standby status can be checked with PRCM.CM\_IDLEST\_MPU[0] ST\_MPU bit.

For the MPU to be on, the core (referred here as the device core) power must be on.

Device power management does not allow INTC to go to OFF state when MPU domain is on (active or one of retention modes).

The NEON core has independent power off mode when not in use. Enabling and disabling of NEON can be controlled by software.

**CAUTION**

The MPU L1 cache memory does not support retention mode, and its array switch is controlled together with the MPU logic. For compliance, the L1 retention control signals exist at the PRCM boundary, but are not used. The ARM L2 can be put into retention independently of the other domains.

MPU retention modes are:

- Open switch retention (OSwR)
- Closed switch retention (CSwR)

These modes are described in [Table 3-16](#).

**Table 3-16. MPU Retention Modes**

Name	Mode	ARM Logic	L1	L2
Dormant	OSwR	OFF	OFF	RET
RET	CSwR	ON	ON	RET

[Table 3-17](#) outlines the supported operational power modes. All other combinations are illegal. The ARM L2, NEON, and ETM/Debug can be powered up/down independently. The APB/ATB ETM/Debug column refers to all three features: ARM emulation, trace, and debug.

**Table 3-17. MPU Subsystem Operation Power Modes**

Mode	MPU and ARM Core Logic	AMR L2 RAM	NEON	Device Core INTC	APB/ATB Debug and ETM	Comments
1	Active	Active	Active	Active	Disabled or enabled	Functional active run mode (ETM enabled mode when emulation/debug required. Production devices should have ETM disabled).
2	Active	Active	OFF	Active	Disabled or enabled	Functional active run mode. NEON disabled via SW; NEON is internally clock gated.
3	Active	RET	Active	Active	Disabled or enabled	Do not use; see Note 1.
4	Active	RET	OFF	Active	Disabled or enabled	Do not use; see Note 1.

**Table 3-17. MPU Subsystem Operation Power Modes (continued)**

Mode	MPU and ARM Core Logic	AMR L2 RAM	NEON	Device Core INTC	APB/ATB Debug and ETM	Comments
5	Active	OFF	Active	Active	Disabled or enabled	Active mode, L2 is off. Controlled via SW to PRCM. L2 context save and restore required or L2 flush.
6	Active	OFF	OFF	Active	Disabled or enabled	Active mode, L2 is off. Controlled via SW to PRCM. L2 context save and restore required or L2 flush.
7	OFF	RET	OFF	OFF	Disabled or enabled	Lowest power sleep mode (dormant mode), L2 is in retention. Controlled via SW to PRCM. ARM core and L1 context save and restore required or L1 flush.
8	Standby	Active	Standby	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup via interrupt.
9	Standby	Active	OFF	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup via interrupt when NEON is off.
10	Standby	RET	Standby	Active	Disabled or enabled	Standby mode (retention mode). StandbyWFI controlled to put into standby and wakeup via interrupt when L2 is in retention.
11	Standby	RET	OFF	Active	Disabled or enabled	Standby mode (retention mode). StandbyWFI controlled to put into standby and wakeup via interrupt when L2 is in retention and NEON is off.
12	Standby	OFF	Standby	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup via interrupt when L2 is off.
13	Standby	OFF	OFF	Active	Disabled or enabled	Standby mode. StandbyWFI controlled to put into standby and wakeup via interrupt when both L2 and NEON are off.
14	OFF	OFF	OFF	OFF	Disabled or enabled	Power-down mode

In any mode where the MPU or NEON power domains are active, the MPU DPLL clocks must be active (modes 1, 3, and 5 require active clocks from the DPLL, while Modes 7 and 8 do not).

Thus, the MPU DPLL must be in one of these states:

- Locked State
- Low power bypass state: inclk=on, clkout=on, power=on

When the MPU DPLL is not providing clocks, the MPU subsystem must be in a power mode where the MPU power domain, NEON power domain, debug power domain, and INTC power domain are in standby, retention, or off state. The states of the MPU DPLL can be:

- Locked
- STOP low power
- OFF

#### CAUTION

The L2 can be put into retention mode regardless of other voltage domain states. The combination of ARM Logic active and L2 in retention mode (modes 3 and 4) is legal, but results in improper execution of instructions with referencing data from L2. This combination must not be used.

### 3.3.2.4 Transitions

Table 3-18 describes allowable transitions from power modes described in Table 3-17. For example, a transition from mode 13 to mode 4 is allowed, but the reverse is not true because the L2 RET to OFF is illegal.

Any mode change that requires state saving or flush must be serialized. For example, L2 RET does not require state saving, so it can happen at the same time as power-down NEON. L2 off and NEON off cannot happen at the same time, because L2 flush and NEON state saving must be serialized. Standby mode can enter from active mode only by executing the wait for interruption (WFI) instruction.

**Table 3-18. Power Mode Allowable Transitions**

From	To Power Mode													
	1	2	3	4	5	6	7	8	9	10	11	12	13	14
1	Y	Y	Y	Y	Y			Y						Y
2	Y	Y	Y	Y		Y			Y		Y			Y
3	Y	Y	Y	Y			Y			Y				
4	Y	Y	Y	Y			Y				Y			
5	Y		Y	Y	Y	Y	Y			Y		Y		Y
6		Y	Y	Y	Y	Y	Y				Y		Y	Y
7	Y	Y	Y	Y			Y							
8	Y		Y					Y		Y				
9	Y	Y	Y	Y					Y		Y			
10	Y		Y					Y		Y				
11	Y	Y	Y	Y					Y		Y			
12	Y		Y		Y							Y		
13	Y	Y	Y	Y	Y	Y			Y		Y		Y	
14	Y	Y	Y	Y	Y	Y	Y							Y

For more information about clocks, reset, power management, and wake-up events for the MPU subsystem, see the *Power, Reset, and Clock Management (PRCM)* chapter.

## 3.4 MPU Subsystem Basic Programming Model

For detailed descriptions of registers used for MPU configuration, see the *Power, Reset, and Clock Management*, and the *Interrupt Controller* chapters.

### 3.4.1 Clock Control

For clock configuration settings, see the *Power, Reset, and Clock Management (PRCM)* chapter.

### 3.4.2 MPU Power Mode Transitions

The following subsections describe transitions of different power modes for MPU power domain:

- Basic power on reset
- MPU into standby mode
- MPU out of standby mode
- MPU power on from a powered off state

#### 3.4.2.1 Basic Power-On Reset

The power on reset follows the following sequence of operation and is applicable to initial power-up and wakeup from device off mode.

1. Reset DPLL, supply reference clock, program the MPU DPLL in applicable DPLL mode to generate clocks for MPU subsystem modules. This is controlled solely by the PRCM module.
2. Reset the INTC (CORE\_RST) and the MPU subsystem modules (MPU\_RST). The clocks must be active during the MPU reset and CORE reset.

#### 3.4.2.2 MPU Into Standby Mode

The MPU into standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. The ARM core initiates entering into standby via software only (CP15 - WFI).
2. MPU modules requested internally of MPU subsystem to enter idle, after ARM core standby detected.
3. MPU is in standby output asserted for PRCM (all outputs guaranteed to be at reset values).
4. PRCM can now request INTC to enter into idle mode. Acknowledge from INTC goes to PRCM.
5. PRCM can start to shut down clocks through DPLL programming.

---

**NOTE:** The INTC SWAKEUP output is a pure hardware signal to PRCM for the status of its IDLE request and IDLE acknowledge handshake.

---

---

**NOTE:** In debug mode, ICE-Crusher could prevent MPU subsystem from entering into IDLE mode.

---

#### 3.4.2.3 MPU Out of Standby Mode

The MPU out of standby mode follows the following sequence of operation and is applicable to initial power-up and wakeup from device Off mode.

1. PRCM must start clocks through DPLL programming.
2. Detect active clocking via status output of DPLL.
3. Initiate an interrupt through the INTC to wake up the ARM core from STANDBYWFI mode.

#### 3.4.2.4 MPU Power-On from a Powered-Off State

1. DPLL Power On, MPU Power On, NEON Power On, Core Power On (INTC) should follow the ordered sequence per power switch daisy chain to minimize the peaking of current during power-up.

**NOTE:** The core domain must be on, and reset, with the clocks of the DPLL on, before the MPU can be reset.

---

2. Then follow the reset sequence as described in [Section 3.4.2.1](#), *Basic Power-On Reset*.

### 3.4.3 NEON Power Mode Transition

When NEON power domain transition is configured to Automatic Hardware-supervised mode (CM\_CLKSTCTRL\_NEON[1:0] CLKTRCTRL\_NEON bits are set to 0x3), it can not transition into idle unless MPU goes into Standby, because of the Hardware Sleep dependency between NEON and the MPU domain. In that case, the MPU domain must also be configured in Automatic Hardware Supervised mode (CM\_CLKSTCTRL\_MPU[1:0] CLKTRCTRL\_MPU bits must be set to 0x3) for the NEON power domain transition to happen.

### 3.4.4 ARM Programming Model

For the complete programming model, see the *ARM® Cortex™-A8 Technical Reference Manual*.

### 3.5 Revision History

[Table 3-19](#) lists the changes made since the previous version of this document.

## 4.1 PRCM Introduction to Power Management

This introduction contains the following information:

- Requirement and goal of power management in mobile devices
- State-of-the-art power-management techniques for maximizing battery life for mobile devices
- Essential architectural building blocks for power management
- Overview of the device power-management architecture

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *OMAP35x Family* section, and your device-specific data manual.

---

### 4.1.1 Goal of Power Management

Power management (efficient use of the available limited battery resources of a mobile device) is one of the most important design aspects of any mobile system. It imposes strong control over limited available power resources to ensure they function for the longest possible amount of time.

The device architecture ensures maximum performance for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements.

### 4.1.2 Power-Management Techniques

The following sections describe the state-of-the-art power-management techniques supported by the device.

---

**NOTE:** The values in [Figure 4-1](#) through [Figure 4-4](#), which show power-management techniques, are hypothetical only. They do not represent valid test results on the device.

---

#### 4.1.2.1 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) reduces the device voltage and frequency by minimizing the idle time of the system. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required amount of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

**Figure 4-1. Comparison of Energy Consumed With/Without DVFS**

prcm-001

Figure 4-1 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so both dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their optimal operating points, it is possible to minimize the power consumption of the device for a given task.

For practical reasons related to device making (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or operating performance point (OPP), is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

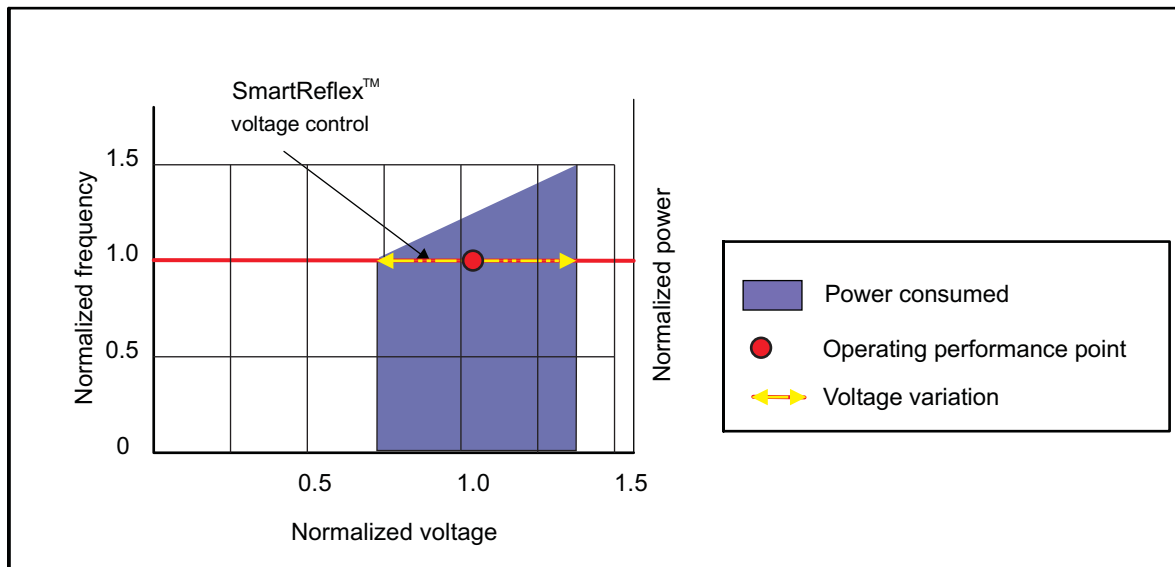

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

#### 4.1.2.2 SmartReflex Adaptive Voltage Control

SmartReflex is a power-management technique for automatic control of the operating voltage of a module to reduce active power consumption.

With SmartReflex, power-supply voltage is adapted to silicon performance, either statically (based on performance points predefined in the manufacturing process of a given device) or dynamically (based on the temperature-induced real-time performance of the device). A comparison of these predefined performance points to the real-time on-chip measured performance determines whether to raise or lower the power-supply voltage.

SmartReflex achieves the optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variation.

**Figure 4-2. SmartReflex Example**

prcm-002

In [Figure 4-2](#), the self-adjusting voltage scaling with SmartReflex ensures the frequency performance of the current OPP. For a given device operating frequency, the device voltage is automatically adapted to maintain performance of the device. This ensures optimal power consumption for a given OPP.

With SmartReflex, the frequency steps are identified and the voltage is adapted according to the silicon performance of the device. In this case, instead of a voltage step for each frequency step, there is a corresponding range of voltages. The range depends on the fabrication process of the device and its real-time operating state (temperature) at a given frequency.

#### 4.1.2.3 Dynamic Power Switching

Like DVFS, dynamic power switching (DPS) is a power-management technique aimed at reducing active power consumption of a device. However, whereas DVFS reduces both dynamic and leakage power consumption, DPS reduces only leakage power consumption, at the expense of a slight overhead in dynamic power consumption.

With DPS, the system switches dynamically between high- and low-consumption system power modes during system active time. When DPS is applied, a processor or system runs at the highest OPP (maximum frequency and voltage) to complete its tasks quickly, followed by an automatic switch to a low-power mode, for minimum power consumption. DPS is useful when a real-time application is waiting for an event. The system can switch into a low-power system mode if the wake-up latency conditions allow it.

This technique consists of maximizing the idle period of the system to reduce its power consumption.

**Figure 4-3. Comparison of Energy Consumed With/Without DPS**

prcm-003

Figure 4-3 compares the power consumption behavior for the same device operation without DPS (left side of the figure) and with DPS (right side of the figure). When operating without DPS, the device has a constant leakage current in idle mode. By using DPS, the system reduces the leakage current to zero. However, the transitions between system power modes may require storing the information before entering a low-power INACTIVE state and restoring the information after a wake-up event (see Figure 4-3). This results in additional dynamic power consumption, referred to as the transition overhead, (see Figure 4-3). Transition overhead must be considered for a DPS operation.

For efficient deployment of DPS techniques, it is necessary to predict dynamically the performance requirement of the applications running on the processor. The DPS controller must account for the overhead of wake-up latencies related to domain switching and ensure that they do not significantly affect the performance of the device. Even with transition overhead, however, the user can identify an optimal idle-time limit after which the DPS is useful for dynamic power-saving.

#### 4.1.2.4 Standby Leakage Management

Standby leakage management (SLM) is a power-management technique that reduces standby power consumption by reducing power leakage.

With SLM, the device switches into low-power system modes automatically or in response to user requests during system standby (that is, in situations when no application is started and system activity is negligible or limited).

When applying SLM, the system remains in the lowest static power mode compatible with the system response time requirement.

This technique trades static power consumption for wake-up latency.

#### 4.1.2.5 DPS Versus SLM

DPS and SLM are similar concepts: they consist of switching the system between high- and low-power consumption modes. However, their operating timescales differ, principally in the latency allowed for mode transitions.

DPS is generally used in an applicative context (tasks are started). Therefore, mode transitions are related to system performance requirements or the processor load. DPS transition latencies must be small (typically between 10  $\mu$  and 100  $\mu$ ) compared to the time constraints or deadlines of the application so that they do not degrade application performance. DPS requires performance prediction to ensure that transition latencies do not deteriorate device performance to the point that real-time application deadlines are missed or the user experience degrades too much for an interactive application.

SLM is not used in an applicative context (no task started). Mode transitions are related more to system responsiveness, and the transition latencies must be small compared to user sensitivity so that they do not degrade the user experience. For SLM, transition latencies are typically 1 ms to 10 ms or more.

DPS and SLM also differ in the type of wake-up event used to exit low-power idle mode. For DPS, wake-up events are application-related (timer, DMA request, peripheral interrupt, etc.); for SLM, wake-up events are user-related (touch screen, key pressed, peripheral connections, etc.).

#### 4.1.2.6 Combining Power-Management Techniques

The power-management techniques previously described have specific features and are most effective when used under the specific operating conditions of the device. Hence, the best active power saving is obtained by combining the DVFS, DPS, SLM, and SmartReflex techniques. For a given operating state, one or more of the power-saving techniques can be applied to ensure optimal operation with maximum power saving.

SmartReflex can be used at boot time to adapt the voltage to device process characteristics (strong/weak) and then used continuously to compensate temperature variations. It can also ensure maximum available application performance of the device at a given OPP.

When medium application performance is required, or when application performance requirements vary, DVFS can be applied. The voltage and frequency can be scaled to match the closest OPP that meets the performance requirement.

When application performance requirements fall between two OPPs, or when a low application performance is required that is below the lowest performance OPP, DPS can be applied to switch to low-power mode.

When combining DVFS and DPS, the operating frequency must not be scaled to match the performance requirement without scaling the voltage. Lower operating frequency increases task completion time and reduces idle time. This prevents DPS or reduces its efficiency (DPS becomes more effective as idle time increases). Unless DPS cannot be applied for other reasons, for a given operating point of DVFS the operating frequency must always be set to the maximum allowed at a given voltage. This ensures optimal process completion time and application of DPS.

If DPS cannot be applied in a given context, scaling the frequency while keeping the voltage constant does not save energy; it does, however, reduce peak power consumption. This can have a positive effect on temperature dissipation and battery life.

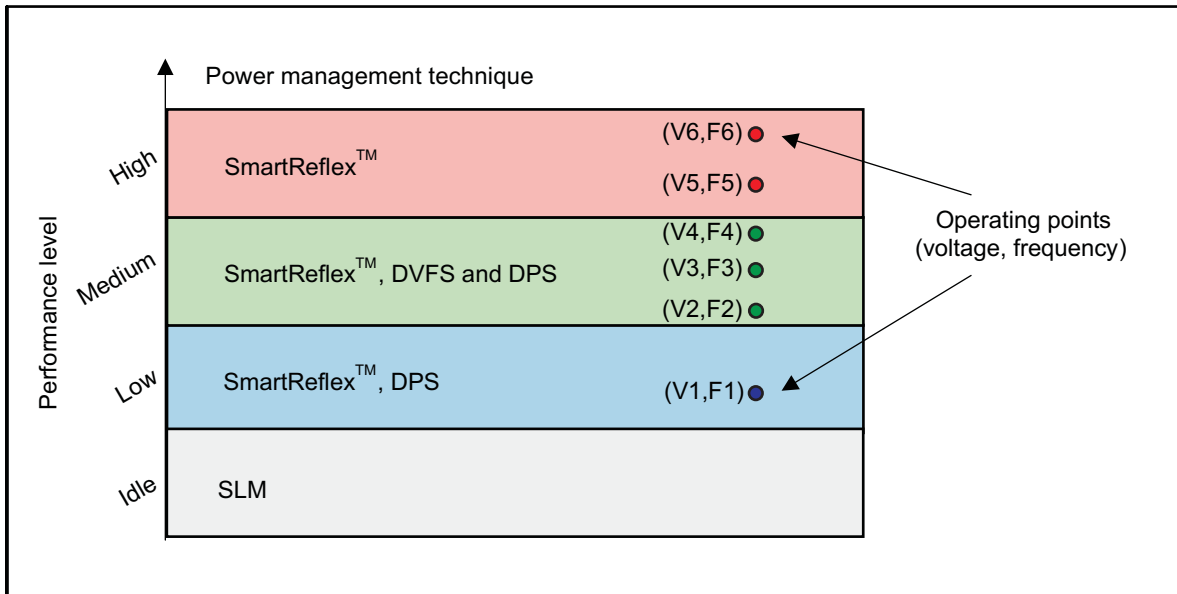

In situations where no applications are running and performance requirement drops to zero, SLM must be used.

---

**NOTE:** The OPPs shown in [Figure 4-4](#) are only for indication and clarity of text. They do not correspond to validated OPPs of the device.

---

**Figure 4-4. Performance Level and Applied Power-Management Techniques**

prcm-004

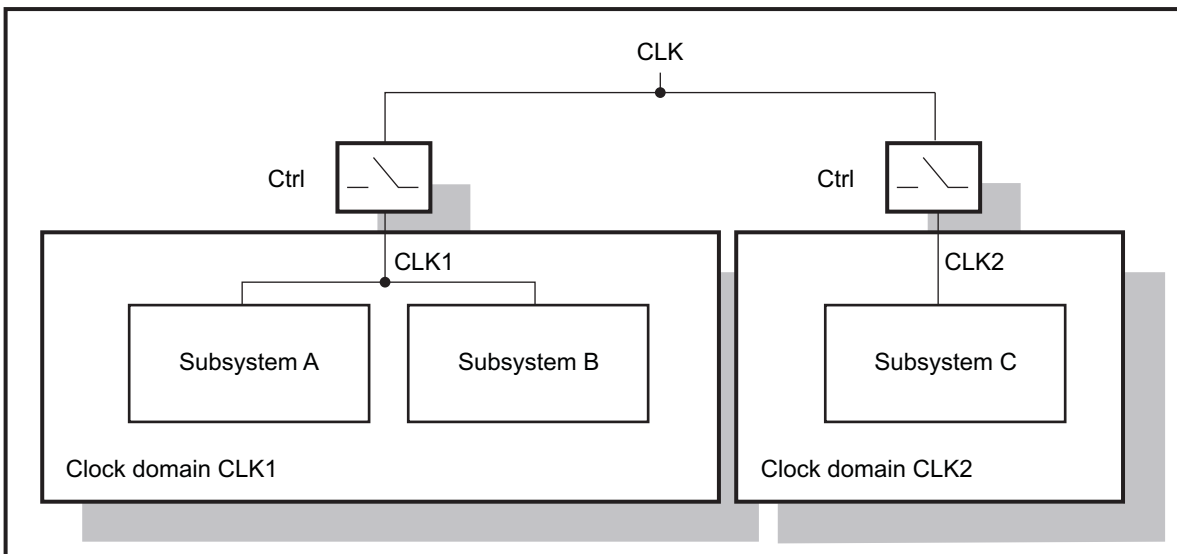

### 4.1.3 Architectural Blocks for Power Management

The device supports the previously described power-management techniques through three architectural blocks: the power, clock, and voltage domains. A domain is a group of modules or subsections of the device that share a common entity (clock, voltage, or power switching).

#### 4.1.3.1 Clock Domain

A clock domain is a group of modules fed with the same gated clock signal (see Figure 4-5). By gating the clock to each domain, it is possible to cut a clock to a group of inactive modules to lower their active power consumption. Thus, a clock domain allows control of dynamic power consumption by the device.

**Figure 4-5. Generic Clock Domain**

prcm-005

Table 4-1 lists the two possible states of the clock domain.

**Table 4-1. States of a Clock Domain**

State	Description
Active	The domain clock is running.
Idle	The domain clock is stopped or gated.

### 4.1.3.2 Power Domain

A power domain is a section of the device with independent and dedicated power rails (see [Figure 4-6](#)). A power domain can be turned on/off without affecting the other parts of the device.

**Figure 4-6. Generic Power Domain**

prcm-006

To minimize power consumption by the device, the modules are placed in power domains. A power domain is attached to two voltage sources: an active voltage source (VDD) and a retention voltage source (VRET). Active voltage is the normal operating voltage of logic and memory in the power domain. Retention voltage is less than active voltage. At retention voltage, logic and memory are not operational, but their content or state is retained. This RETENTION state is useful for quickly switching to low-power idle mode without losing the context, and then quickly switching back to ACTIVE state when necessary. In RETENTION state, power consumption is less than in normal operating mode. VRET and VDD are connected to the power domain by two switches. VRET is supplied to the parts of the logic whose context is to be retained (with retention flip-flops [RFFs]) and to the memory section, whose contents are to be maintained. Then, depending on the power state, the two switches can be opened or closed.

[Table 4-2](#) lists the possible states of the power domain with the corresponding status of the VDD and VRET switches.

**Table 4-2. Power Domain States**

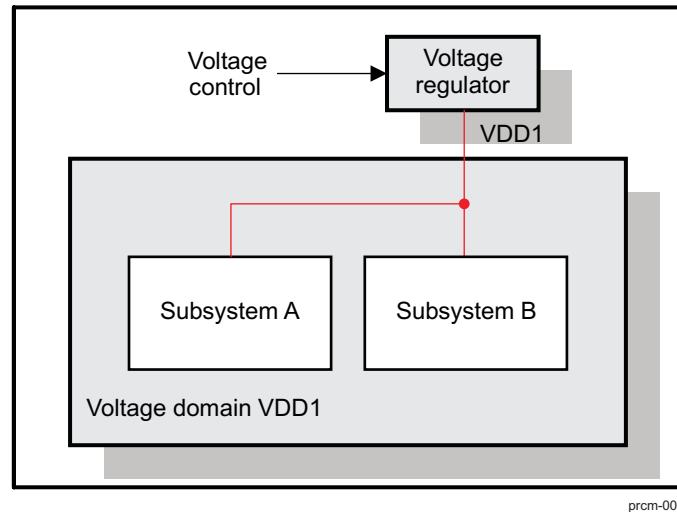

State	VDD Switch	VRET Switch
ACTIVE	Close	Open
RETENTION	Open	Close
OFF	Open	Open

### 4.1.3.3 Voltage Domain

A voltage domain is a group of modules supplied by the same voltage regulator (embedded or external). The power consumption of this group can be controlled by regulating its voltage independently.

Figure 4-7 shows the voltage domain.

**Figure 4-7. Generic Voltage Domain**

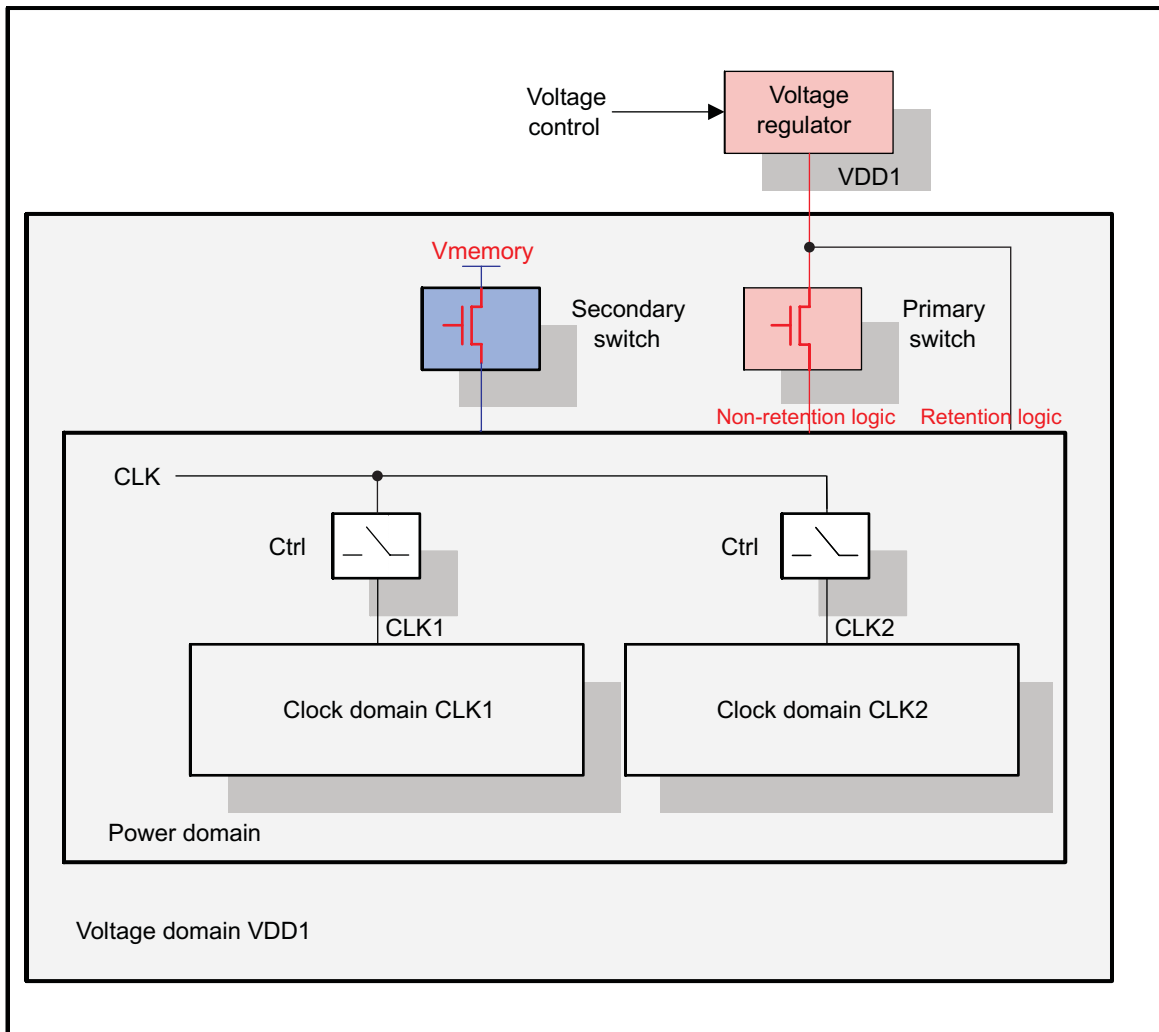

By partitioning the device into independent voltage domains it is possible to assign different operating voltages to the different modules. The independent voltage control allows voltage scaling of device subsections to ensure that each module operates at the optimized operating voltage level based on the application performance requirements. When all modules within a voltage domain are inactive, the domain voltage can be lowered to reduce power consumption and then be switched back to normal operating voltage when a wake-up event is received.

### 4.1.4 Device Power-Management Architecture

The device architecture integrates the power-management architectural blocks for power-management support. It is composed of scalable/switchable voltage domains (their voltage can be controlled) and switchable power domains. Figure 4-8 shows the general hierarchical architecture scheme of the voltage, power, and clock domains.

A clock domain is a subset of a power domain. This avoids unnecessary dependencies between power domains caused by clocks covering multiple power domains. Each clock within a power domain, with an independent gating control, is a separate clock domain.

Figure 4-8. Voltage, Power, and Clock Domain Hierarchical Architecture

108-008

Each power domain is supplied by one or more voltage domains that can be scaled down or switched off to save power. Internal memory and logic can be put in standby (retention) mode independently. In this state, memory is not operational, but the content is retained with minimized leakage. This feature allows power consumption to be reduced when the device is in sleep mode while maintaining memory contents for fast context restore. The logic and memory standby feature is software-controllable.

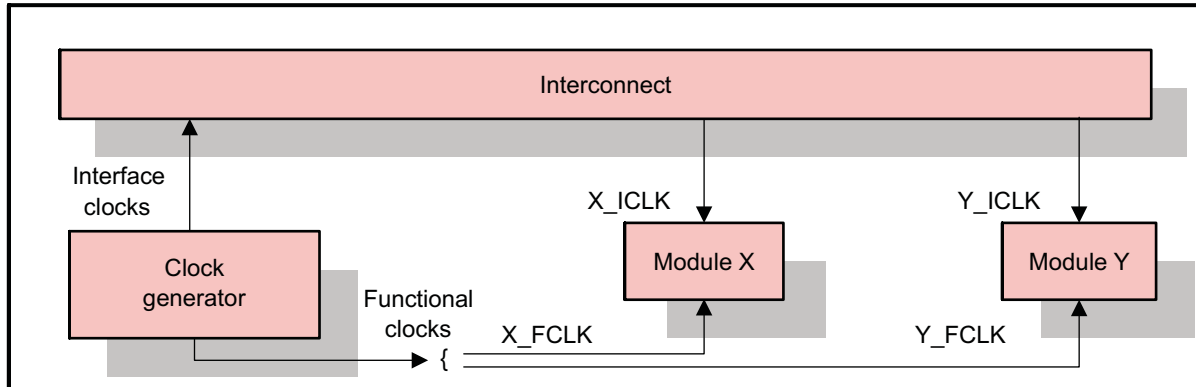

The OMAP35x supports a clock distribution and control architecture, which is described in the following sections.

#### 4.1.4.1 Module Interface and Functional Clocks

The clocks delivered to the modules in the device are divided into two categories: interface clocks and functional clocks (see [Figure 4-9](#)).

**Figure 4-9. Functional and Interface Clocks**

prcm-009

Interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the module interface and registers.
- A typical module has one interface clock, but it can have several.
- They are synchronous across the entire device, because the interconnect fabric is itself fully synchronous.
- Interface clock management is done at the device level.
- From the standpoint of the power, reset, and clock management (PRCM) module, an interface clock is distributed through the device interconnect and is identified with an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or a subsystem.
- Each module can have several functional clocks, or none at all. A module may or may not require its functional clocks to be active (non-idle).
- Several modules can share the same functional clock signals, but the branches of the clock tree are not balanced between the modules.
- From the PRCM standpoint, a functional clock is directly distributed to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

---

**NOTE:** At the module level, the interface clocks are always fed by the interface clock outputs of the PRCM. The functional clocks are fed either by a PRCM functional clock output or a PRCM interface clock output. In the latter case, the functional and interface clocks of the module inherit capabilities (autoidle features) from the PRCM interface clock (see [Section 4.7, Clock Manager Functional Description](#)).

---

#### 4.1.4.2 Autoidle Clock Control

The device supports an autoidle clock control scheme for the module interface clocks. With this control scheme, PRCM can automatically activate and deactivate the interface clock of any device module, depending on its operating mode. This scheme executes under hardware control and is transparent to the software. This scheme identifies two module types in the device: the target and the initiator modules, or subsystems.

---

**NOTE:** The functional clocks do not have the autoidle clock scheme, and the software must gate the functional clock of each module when it is not needed.

---

### Initiator

An initiator can generate bus transactions (read, write, etc.) toward targets. It is considered to be active when it generates transactions. If it enters standby mode, it stops generating transactions. Because most initiators also support a target port for configuration purposes, they are both targets and initiators. Some examples of initiators are processors, direct memory access (DMA), and memory management unit (MMU).

### Target

A target is a passive module that can process bus transactions (that is, it reads/writes to memory-mapped registers). It is considered to be active when its interface clocks and some or all of its functional clocks are available so it can accept incoming transactions. A target can be put in idle mode by the PRCM, and in this mode its interface clock can be gated at any time. An idle module can still receive its functional clocks and generate interrupts and DMA requests. It can also generate asynchronous wake-up requests, if it is wakeup-capable.

### Active, Idle, and Standby Modes

The PRCM module handles automatic clock control differently for initiator and target modules.

For the initiator module, the following hardware handshake scheme is employed:

1. The initiator, when switching from active to idle mode, signals its status to the PRCM.
2. The PRCM cuts off the interface clock to the initiator module.
3. When the initiator module must reactivate, it signals the PRCM, which reactivates its functional and interface clocks.

For the target module, the following hardware handshake scheme is employed:

1. When the PRCM confirms that the target module satisfies the idle conditions, it signals the target module.
2. The target module acknowledges the idle request of the PRCM, depending on its idle mode internal settings (for details about idle mode settings, see the chapter in the technical reference manual for the corresponding device module):
  - If the module is set to smart-idle mode, it terminates its current operations, and then acknowledges the idle request to the PRCM.
  - If the module is set to force-idle mode, it acknowledges immediately, regardless of its current state. Because pending transfers, interrupts, and DMA requests can potentially be lost, special software care must be taken.
  - If the module is set to no-idle mode, it does not acknowledge the idle request. This forces the PRCM to maintain the clock active.
3. The PRCM cuts off the module clocks.
4. The target module can be wakened by the PRCM when its wake-up conditions are satisfied (wake-up event). It activates the module clocks, and then signals the wakeup.
5. The target module acknowledges the wake-up request.
6. Some target modules can support wake-up capability. They can explicitly request the PRCM to activate their clock.

This automatic clock control ensures reduced dynamic power consumption of the device without any associated software overhead.

### 4.1.5 SmartReflex Voltage-Control Overview

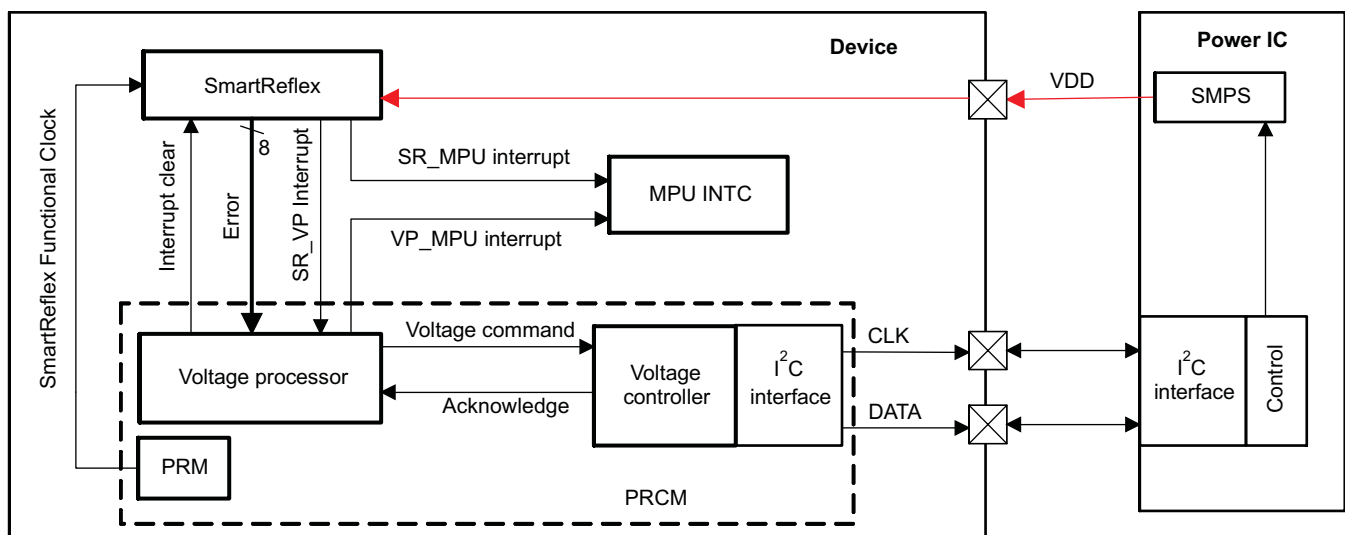

SmartReflex is a power-management technique for controlling the operating voltage of a device to reduce its active power consumption.

With SmartReflex, the power-supply voltage is adapted to the silicon performance either statically (adapted to the manufacturing process of a given device) or dynamically (adapted to the temperature-induced current performance of the device). A comparison of predefined performance points to real-time on-chip measured performance determines whether to raise or lower the power supply voltage.

SmartReflex achieves optimal performance/power trade-off for all devices across the technology process spectrum and across temperature variations.

Figure 4-10 is a functional overview of the SmartReflex voltage-control architecture of the device connected to an external power IC.

Figure 4-10. SmartReflex Voltage-Control Functional Overview

prcm-UC-001

SmartReflex voltage control consists of the following modules:

- SmartReflex
- Microprocessor unit (MPU) interrupt controller (INTC)
- Voltage processor
- Voltage controller
- Inter-integrated circuit (I<sup>2</sup>C) interface
- Switch mode power supply (SMPS)

The SmartReflex module senses input voltage (VDD) and generates an error value that identifies the difference between the desired voltage and the actual value of the SMPS. This error value is set in an internal register (for software read, if necessary) and is also passed to the voltage processor.

The voltage processor converts the error value to a voltage command that defines the change in the output voltage of the SMPS required to bring it to the desired voltage level.

The voltage command is sent to the voltage controller, which passes it to the power IC through the dedicated I<sup>2</sup>C interface. The power IC then adjusts the output voltage of the SMPS according to the command.

In this way, the SmartReflex module dynamically adjusts the SMPS voltage to compensate for voltage variations.

The device supports two operational modes for SmartReflex voltage control:

- Manual (software-controlled)

- Automatic (hardware-controlled)

#### 4.1.5.1 Manual SmartReflex Voltage Control

In manual voltage control, the SmartReflex module interrupts the MPU when the voltage level crosses the defined voltage limits (minimum/maximum). The MPU reads the error value and determines the new voltage command to be sent to the SMPS to return the voltage to within the limits. The new voltage command is sent to the voltage controller, which passes the command to the SMPS and acknowledges its reception.

In manual control, the voltage processor is bypassed.

#### 4.1.5.2 Automatic SmartReflex Voltage Control

In automatic voltage control, the SmartReflex module interrupts the voltage processor module when the voltage level crosses the defined voltage limits (minimum/maximum). The voltage processor reads the error value and determines the new voltage command to be sent to the SMPS to return the voltage to within the limits. The new voltage command is sent to the voltage controller, which passes the command to the SMPS and acknowledges its reception.

In automatic mode, the software does not intervene in voltage control; the entire loop is handled by the hardware modules.

## 4.2 PRCM Overview

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

### 4.2.1 Introduction

The power-management framework of the device significantly reduces dynamic power consumption and static leakage current to extend the life of the battery in the end-product. This framework incorporates support for state-of-the-art power-management techniques. It ensures optimal device operation with significantly reduced power consumption. The PRCM module, which is the enhanced power-management subsystem of the device, is the central control module for the clock, reset, and power-management signals in the device.

The device has the following features to support the different power-management techniques:

- Partitioning of the device into 16 voltage domains and 18 power domains
- Domain isolation that allows any combination of domain ON/OFF states
- Clock tree with selective clock-gating conditions
- Hardware-controlled reset sequencing management
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Support for hardware-controlled autogating of module clocks
- Memory retention capability for preserving memory contents in low-power sleep mode
- Scalable voltage and frequency support for the processors, CORE, and peripherals for DVFS
- SmartReflex adaptive voltage control for real-time performance adjustments
- Support for low-power device off mode input/output (I/O) pad configuration for minimum power consumption when in OFF power state

The PRCM module is the centralized management module for the power, reset, and clock control signals of the OMAP device. It interfaces with all the components on the device for power, clock, and reset management through power-control signals. It integrates enhanced features to allow the device to adapt energy consumption dynamically according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

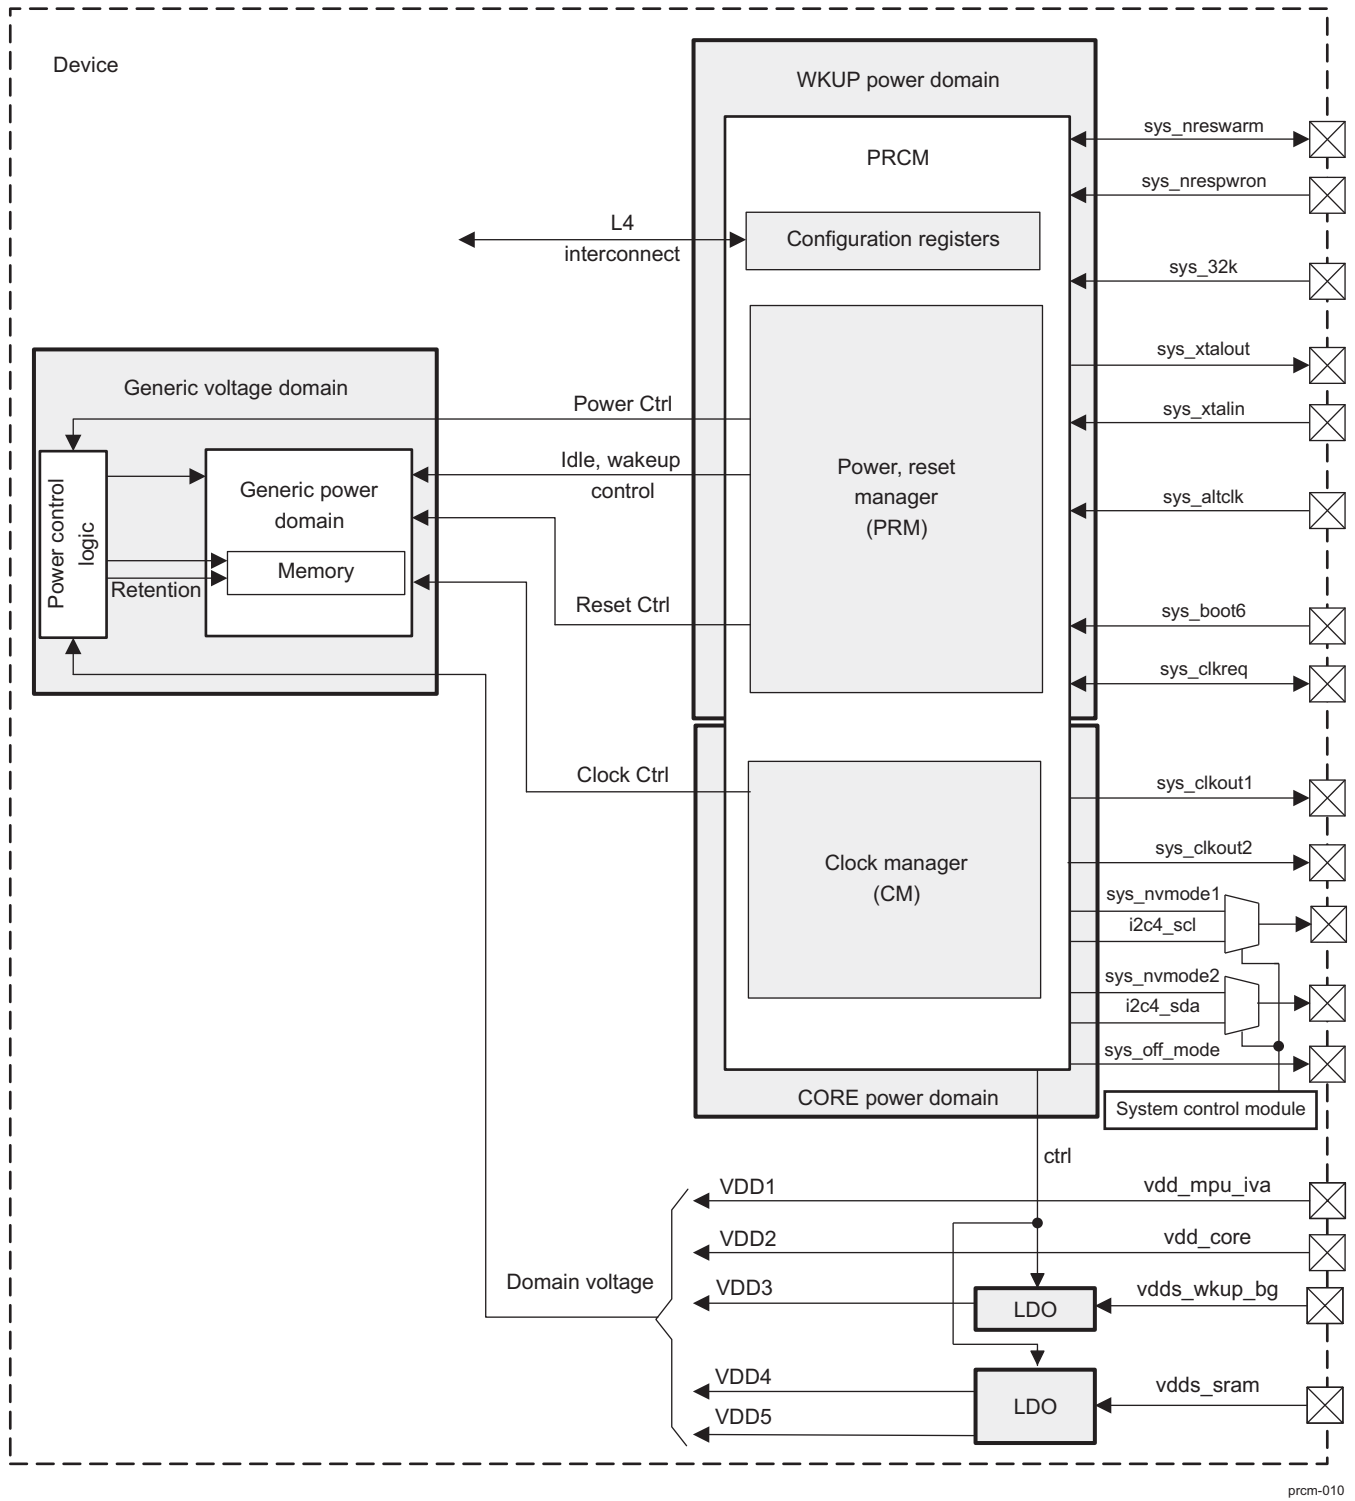

The PRCM module is composed of two main entities:

- Power reset manager (PRM): Handles the power, reset, wake-up management, and system clock source control (oscillator)
- Clock manager (CM): Handles the clock generation, distribution, and management

The PRCM is fully configurable through its L4 interface port.

[Figure 4-11](#) is an overview of the PRCM module and its internal connections with a generic power domain.

Figure 4-11. PRCM Overview

prcm-010

### 4.2.2 PRCM Features

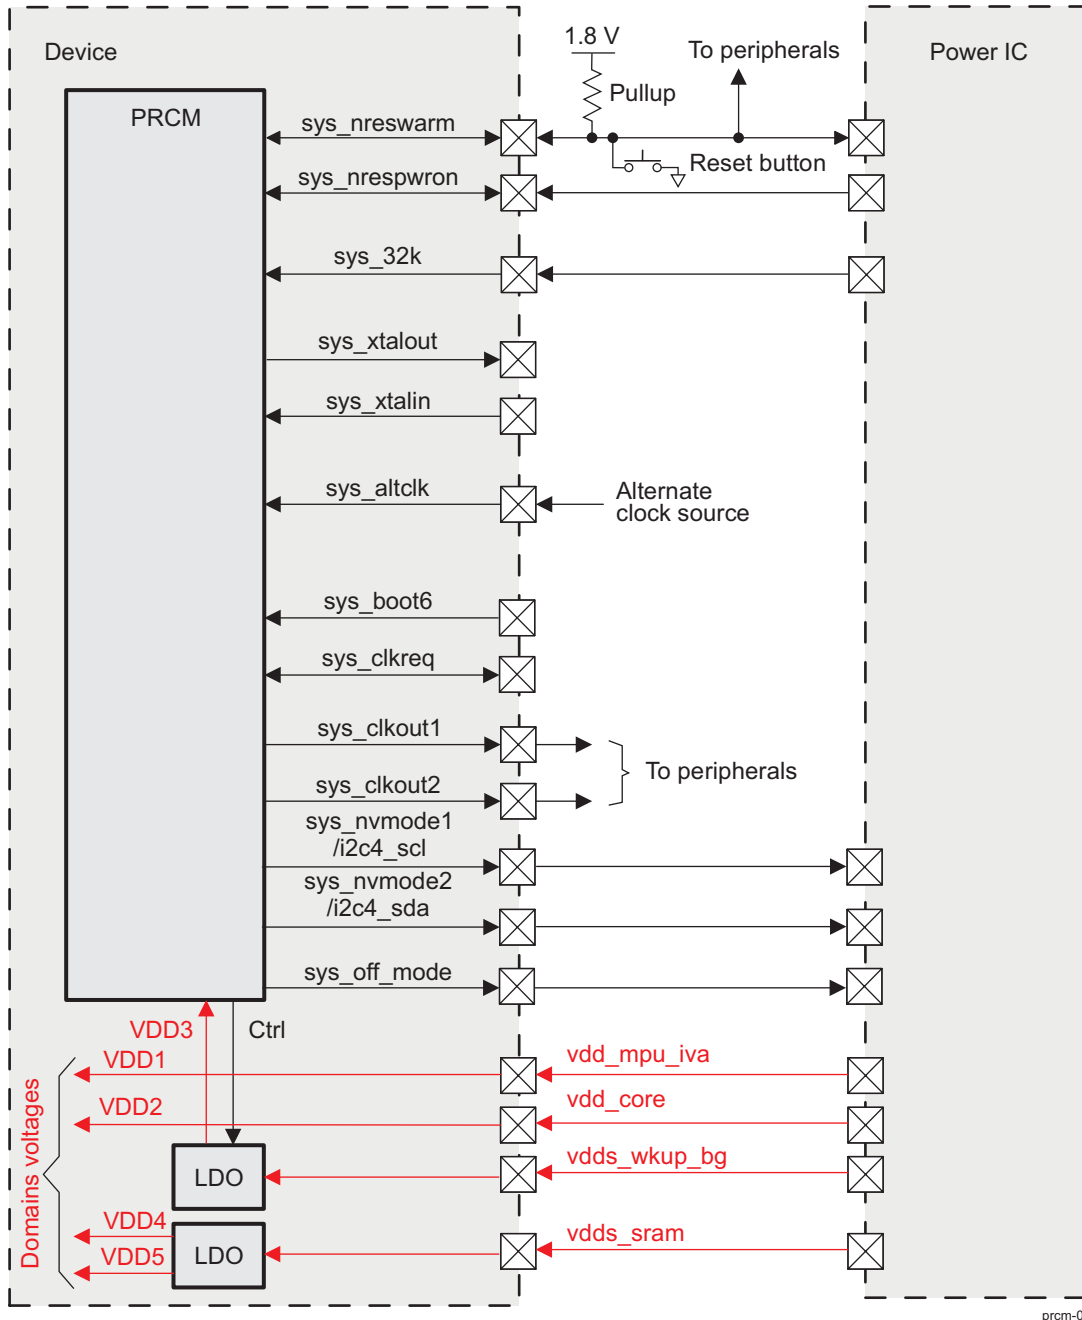

The PRCM module includes the following features:

- Management of 18 independent power domains
- Control of two scalable and three memory-selectable voltage modes
- Handling proper idle/wake-up procedures
- Allowing both software and partial hardware control
- Monitoring and handling wake-up events
- Controlling system clock/reset input sources
- Managing and distributing clocks and resets with high granularity
- Handling power-up sequences
- Debug and emulation features
- Control of external supply voltage regulation through dedicated high-speed (HS) I<sup>2</sup>C interface
- CM implementation of RFFs to support DPS

### 4.3 PRCM Environment

The PRCM module receives the external reset, clock, and power signals. Figure 4-12 shows the interface of the PRCM with external reset, clock, and power sources.

Figure 4-12. PRCM Functional External Interface (Detailed View)

**NOTE:** In the remainder of this chapter, the term "power IC" refers to a peripheral power source IC that is interfaced with the device. It receives power control commands (voltage scaling and power switching) from the device and provides the necessary voltages and reset signals.

Texas Instruments provides a global solution (for power supply and other support functions) with a device connected to the TPS65950 device. For more information about the TPS65950 device, contact your TI representative.

The following sections describe the interfaces for the external clock, reset, and power sources.

### 4.3.1 External Clock Signals

The device has three external clock inputs: low frequency (sys\_32k), high frequency (sys\_xtalin), and an optional clock (sys\_altclk). The device has two configurable clock outputs: sys\_clkout1 and sys\_clkout2. Figure 4-13 shows the external clock signals of the PRCM module. Table 4-3 lists the external clock signals, I/Os, and module reset values.

Figure 4-13. External Clock Interface

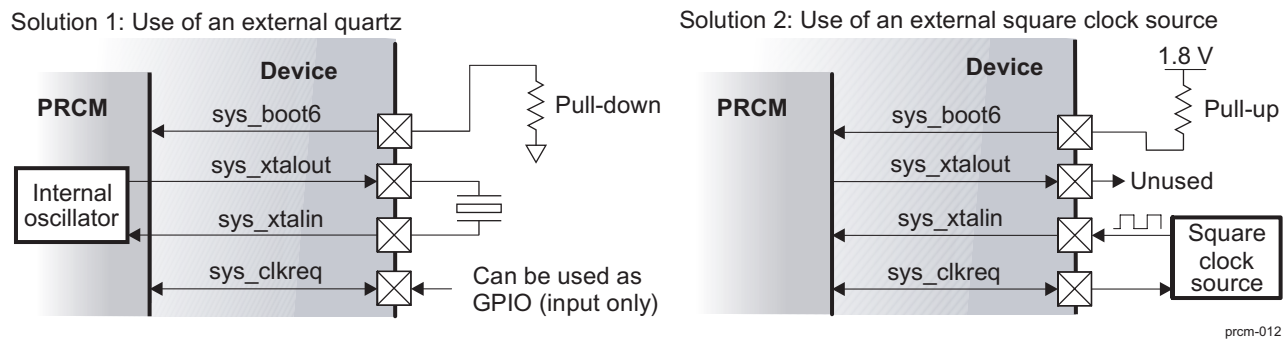

Table 4-3. External Clock Signal Descriptions

Signal Name	I/O <sup>(1)</sup>	Description	Module Reset Value
sys_boot6	I	Boot oscillator mode control	Unknown
sys_32k	I	32-kHz clock input	Unknown
sys_xtalout	O	Output of oscillator	0
sys_xtalin	I	Main input clock. Crystal oscillator clock (only at 12, 13, 16.8, or 19.2 MHz) or CMOS digital clock (at 12, 13, 16.8, 19.2, 26, or 38.4 MHz).	Unknown
sys_clkreq	I/O	Clock request to/ from device for system clock	1
sys_clkout1	O	Configurable output clock 1	0
sys_altclk	I	Alternate clock source selectable for USB (48 MHz) or NTSC/PAL (54 MHz)	Unknown
sys_clkout2	O	Configurable output clock 2	0

<sup>(1)</sup> I = Input, O = Output

Figure 4-14 shows the PRCM external clock sources.

**Figure 4-14. PRCM External Clock Sources**

The system clock source can be either of the following:

- Internal oscillator with crystal connected between sys\_xtalin and sys\_xtalout
- A CMOS digital clock that arrives at the sys\_xtalin pin

In the first option, the sys\_clkreq signal is used in input mode to control sys\_clkout1 and the internal clock oscillator. In the second option, the signal is used in output mode to request the external system clock.

An external pull-down or pull-up tied on sys\_boot6 determines whether the internal oscillator is used or an external clock source is supplied, respectively.

#### CAUTION

Only one clock source option can be used at a time.

An alternate clock input (sys\_altclk) provides a precise clock source for 54 MHz, 48 MHz, or other frequencies (for example, 59 MHz or 49.04 MHz for VDAC).

For more information about external clock signals, see [Section 4.7.5](#), *External Clock Controls*.

### 4.3.2 External Reset Signals

The device supports two reset signals: power-on (sys\_nrespwron) and warm reset (sys\_nreswarm).

sys\_nrespwron is asserted at power up to reset the full logic in the device. sys\_nreswarm can be activated at any time by an external device or an external reset push-button action (see [Figure 4-12](#)) to cause a global warm reset event.

Because sys\_nreswarm is bidirectional, it can also be used to drive a reset of external devices. Any global warm reset source (for example, a push-button) causes sys\_nreswarm to be driven out and maintained for a limited length of time at the boundary of the device. In this way, the device and its related peripherals are properly reset together.

The sys\_nrespwron assertion also causes the sys\_nreswarm assertion.

[Figure 4-15](#) shows the external reset signals. [Table 4-4](#) lists the external reset signals, I/Os, and module reset values.

Figure 4-15. External Reset Signals

Table 4-4. External Reset Signals Description

Signal Name	I/O <sup>(1)</sup>	Description	Module Reset Value
sys_nreswarm	I/O	Warm-boot reset	1
sys_nrespwron	I	Power-on reset	Unknown

<sup>(1)</sup> I = Input, O = Output

### 4.3.3 External Power Signals

The power control signals allow the PRCM to control the device voltage levels. The voltage level of the scalable voltage sources in the external power IC can be scaled by sending commands to the power IC through this interface. The PRCM can also command the power IC to switch the device voltages off when the device is in off mode and activate them when it wakes up.

Figure 4-16 shows the power control interface for the external power IC. Table 4-5 lists the signals, I/Os, and module reset values for the external power IC.

Figure 4-16. Power Control Interface for External Power IC

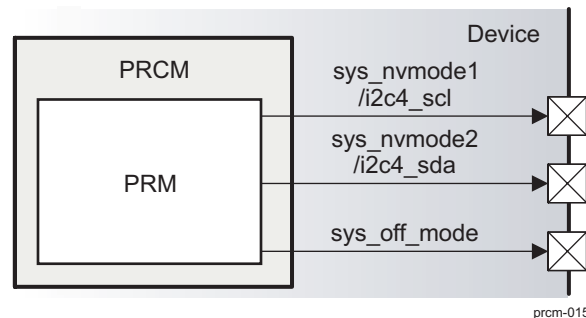

Table 4-5. Power Control Interface Description

Signal Name	I/O <sup>(1)</sup>	Description	Module Reset Value
sys_nvmode1/i2c4_scl	O	Commands the external power IC for control of VDD1 and VDD2 voltages. Shared by the VMODE interface and the SmartReflex dedicated I2C interface.	0x1
sys_nvmode2/i2c4_sda	O	Commands the external power IC for control of VDD1 and VDD2 voltages. Shared by the VMODE interface and the SmartReflex dedicated I2C interface.	0x1
sys_off_mode	O	Requests the external power IC to switch the device voltage level according to the device power status	0x0

<sup>(1)</sup> I = Input, O = Output

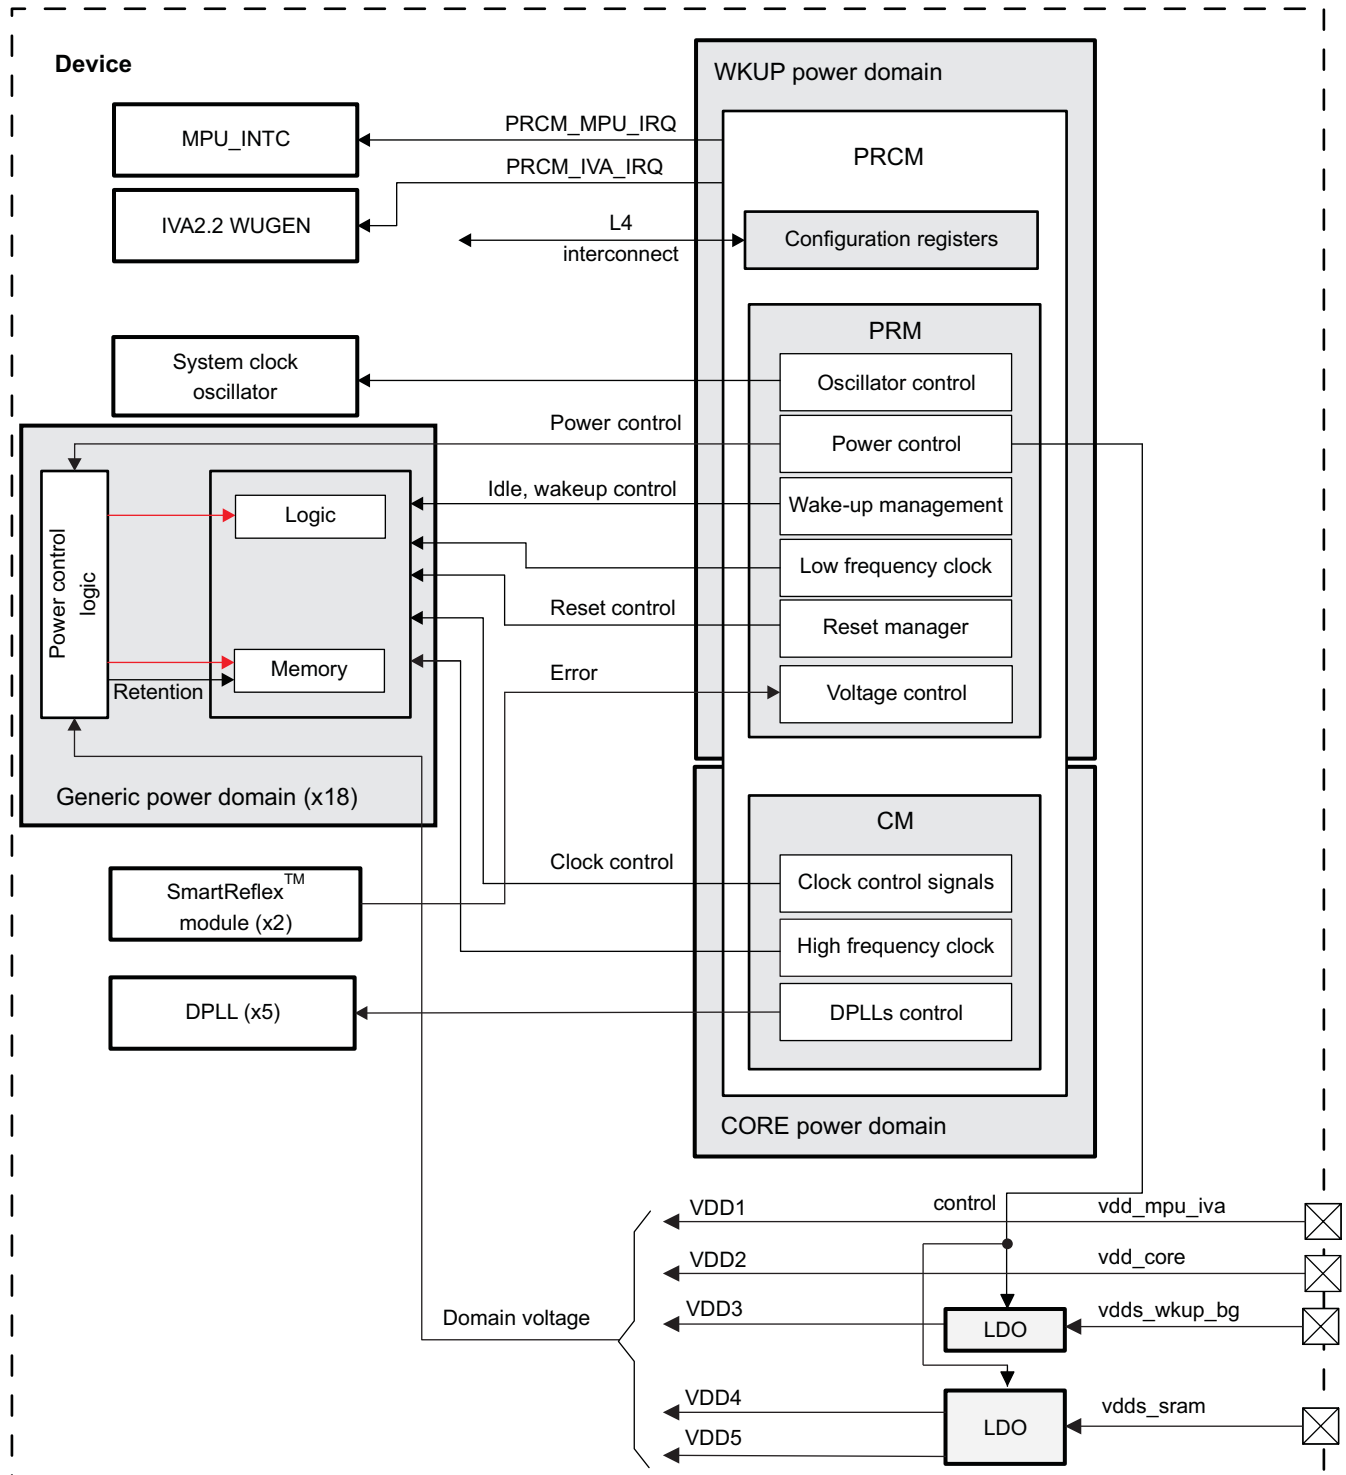

#### 4.4 PRCM Integration

The PRCM internal registers can be accessed for configuration and controlled through the WKUP L4 interconnect. In addition to the L4 interconnect, the PRCM internal module interface contains the following:

- A set of signals for idle/wake-up control for each module
- Clocks and reset signals
- Power control signals (switches and memories) to the power domains
- Interrupts to the MPU subsystem and IVA2.2 subsystem interrupt controllers (INTCs)
- Voltage error commands from the SmartReflex modules
- Digital phase-locked loop (DPLL) control commands for recalibration and bypass
- System clock oscillator control for device-level sleep/wake-up transitions

[Figure 4-17](#) shows details of the control interface to a generic power domain.

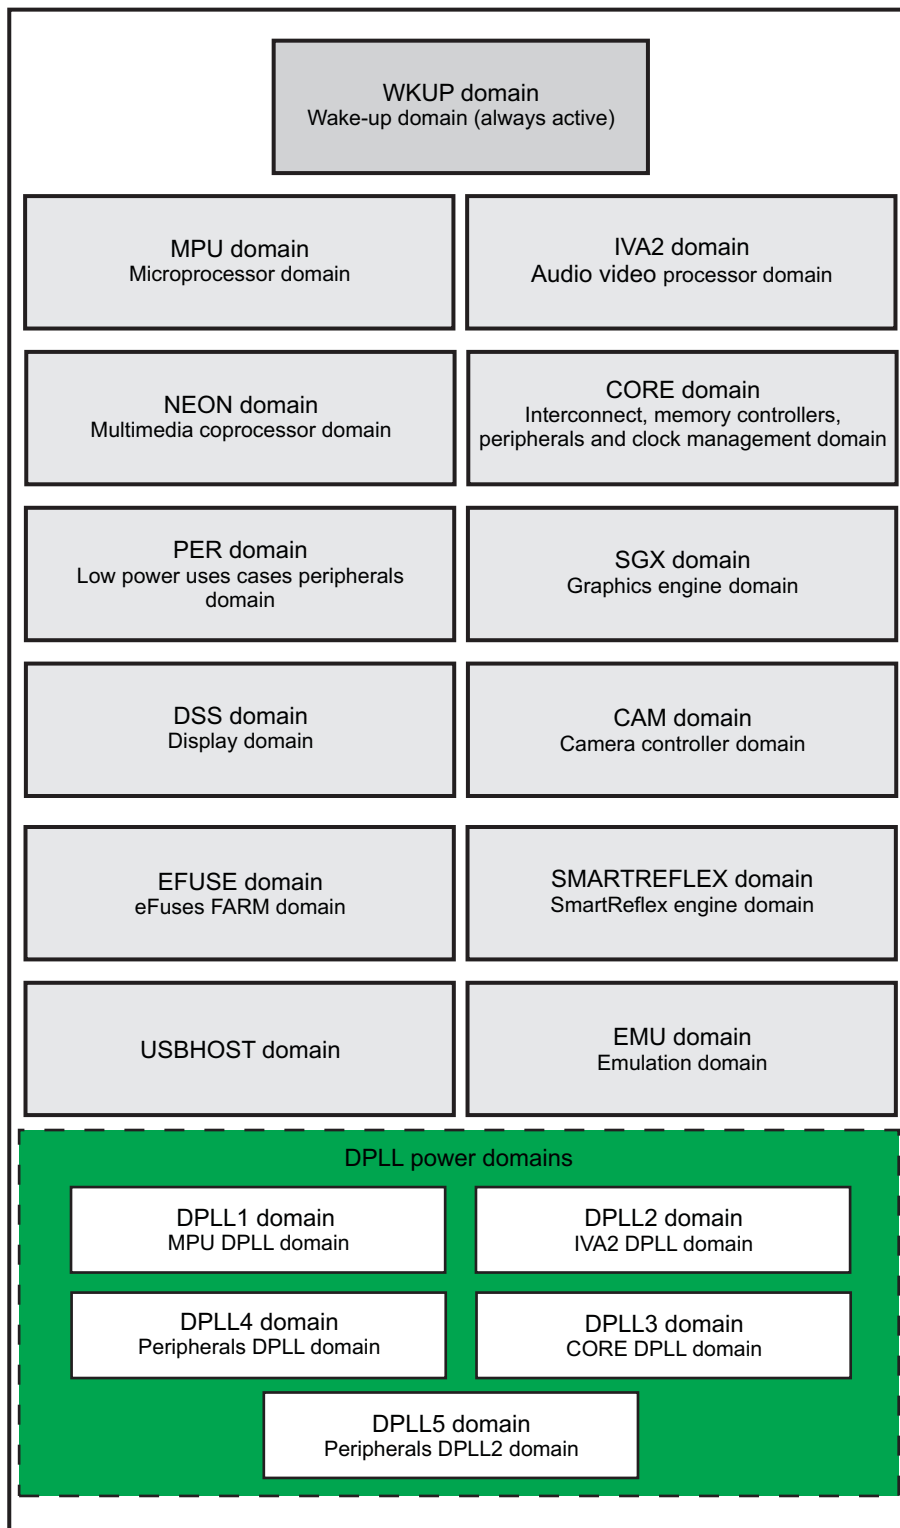

Figure 4-17. PRCM Integration

prcm-016

To significantly reduce leakage in sleep modes (SLM strategy) and to optimize active power consumption savings (DPS strategy), the device is segmented into 18 power domains (see [Figure 4-18](#)).

Figure 4-18. Device Power Domains

prcm-017

Each power domain is fed through an independent switch controlled by the PRM module. In this way, depending on the application scenario, unused parts (domains) can be switched off or put in RETENTION state while others remain active.

## 4.4.1 Power-Management Scheme, Reset, and Interrupt Requests

### 4.4.1.1 Power Domain

The PRCM module is in two power domains (see [Table 4-6](#)).

**Table 4-6. PRCM Power Domains**

PRCM Subsystem Modules	Power Domain
PRM	WKUP
CM	CORE

The PRM module is in the WKUP power domain, which is continuously active. It is composed of the logic that must be permanently supplied to manage domain power-state transitions and detect wake-up events.

The CM module is in the CORE power domain, which can be activated and deactivated according to the requirements of the executing applications.

### 4.4.1.2 Resets

The PRM and CM modules are reset by independent reset signals (see [Table 4-7](#)).

**Table 4-7. PRCM Reset Signals**

PRCM Subsystem	Reset Signal
PRM	PRM_RSTPWON
CM	CM_RSTPWON_RET

The PRM module is reset by the cold reset signal PRM\_RSTPWON. The CM module is reset by assertion of the CM\_RSTPWON\_RET signal.

The CM logic is reset on:

- Any global cold reset
- A CORE power domain transition from OFF to ON

The PRM logic is reset on:

- Any global cold reset

CM and PRM registers that are sensitive to a warm reset are also reset when a global warm reset occurs. However, the CM and PRM logic is not reset.

---

**NOTE:** At global cold reset:

- Only the device finite state-machine (FSM) in the PRM is operating on the 32-kHz clock, and it is released from reset on the release of the global reset.
  - PRM logic operates on the system clock and is released from reset on release of the reset PRM\_RSTPWON.
- 

[Figure 4-19](#) shows the PRCM reset signals.

**Figure 4-19. PRCM Reset Signals**

#### 4.4.1.3 Interrupt Requests

The PRCM module can generate two interrupts:

- PRCM\_MPU\_IRQ: Mapped to the MPU INTC module (M\_IRQ\_11 interrupt line)
- PRCM\_IVA\_IRQ: Mapped to the IVA2.2 WUGEN module (IVA2\_IRQ[12] interrupt line)

## 4.5 PRCM Reset Manager Functional Description

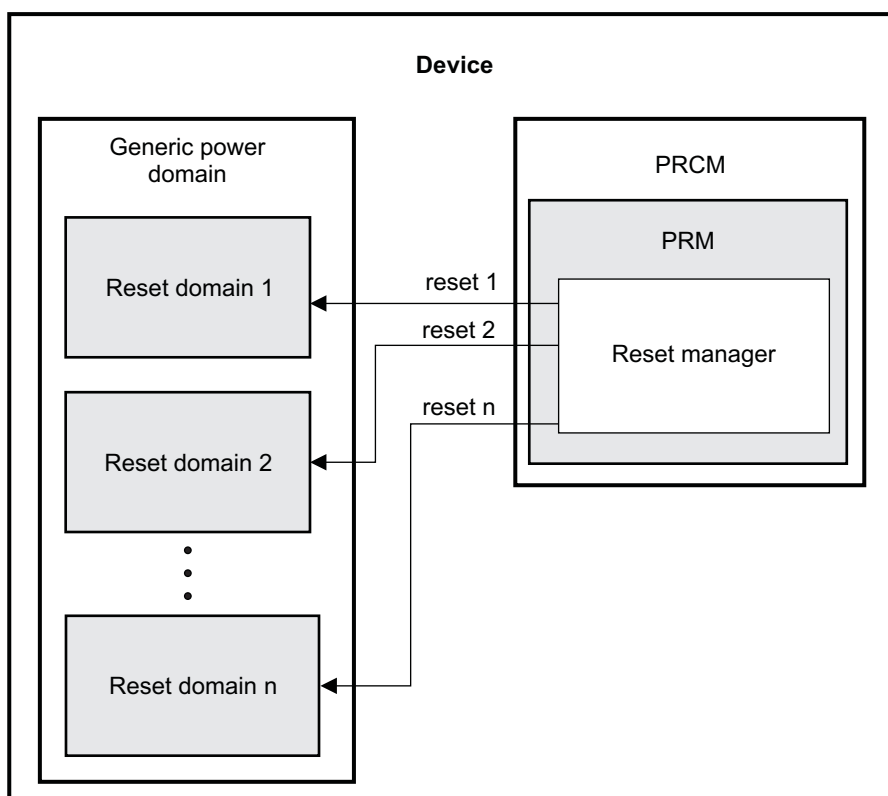

### 4.5.1 Overview

The PRCM manages the reset of all the modules in the device. Resets are distributed across the 18 independent power domains (including DPLLs and SmartReflex modules).

In each power domain, one or several reset domains are defined. A reset domain is defined by a unique reset signal that originates from the reset manager and is connected to one or multiple modules of the device. All the connected modules of the reset domain are reset simultaneously when the reset signal is asserted. Independent control of these reset domains allows sequencing the release of resets and ensures a safe reset on the entire power domain.

Figure 4-20 is an overview of the reset manager interface with a generic power domain in the device.

**Figure 4-20. Reset Manager Interface with Generic Power Domain**

prcm-019

Resets can be generated either by hardware sources or software control. For modules that can be reset by software control, a software-reset bit is implemented in their <module name>\_SYSCONFIG configuration register. Software reset has the same effect on the module logic as a hardware reset.

Special reset control is available when the device operates under emulation control to reset specific reset domains.

---

**NOTE:** All reset assertion is asynchronous, and all reset signals are active low, except for the DPLL reset signals.

---

### 4.5.2 General Characteristics of Reset Signals

Reset signals can be categorized based on three criteria:

- Scope

- Occurrence
- Source type

#### 4.5.2.1 Scope

A reset signal can be categorized according to its scope (the area of the device affected by that reset):

- Global reset: Affects the entire device; all modules are reset. Generally, when the device powers up or an abnormal operation is detected (secure watchdog timer overflows, the eFuse bad device is detected, etc.).
- Local reset: Affects one power or reset domain. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

#### 4.5.2.2 Occurrence

A reset signal can also be categorized depending on when the reset occurs:

- Cold reset: Occurs only on device power up or in certain emulation modes. The cold reset is a global reset that affects every module on the device. It usually corresponds to the initial power-on reset.
- Warm reset: Occurs when the device is in normal operating state. The warm reset is also a global reset, but it does not affect all the modules on the device. Usually, the device does not require a complete reboot on a warm reset. Several reset sources are types of warm resets, such as the global software reset and the watchdog reset.

Modules that behave differently in cold reset and warm reset have two reset signals: RST and PWRON\_RST. These reset signals reconstruct warm reset and cold reset in modules that require them.

For a global warm reset, the PRCM performs the following sequence:

1. It applies a warm reset on all the modules, including modules built with RFFs.
2. It drives the sys\_nreswarm reset output low and holds it for a specified length of time (programmed in the PRCM.PRM\_RSTTIME[7:0] RSTTIME1 bit field).
3. All ongoing transactions on the voltage control I<sup>2</sup>C interface (I2C4 module) are aborted, and the external power IC is expected to return to nominal voltage values on receiving a sys\_nreswarm reset.
4. All power domains that are in off power mode are switched back to on power mode.

A global warm reset does not apply to the following modules of the device:

- SDRC
- System control module (SCM) (I/O control)
- Part of PRM and CM registers (see note below)
- 32-kHz synchronization timer
- DPLL3 (refer to [Section 4.5.9.2](#))
- Emulation modules
- eFuse farm

---

**NOTE:** For information on the PRCM registers affected by the global warm reset see the Registers Mapping Summary tables in [Section 4.14](#), *PRCM Register Manual*.

---

#### 4.5.2.3 Source Type

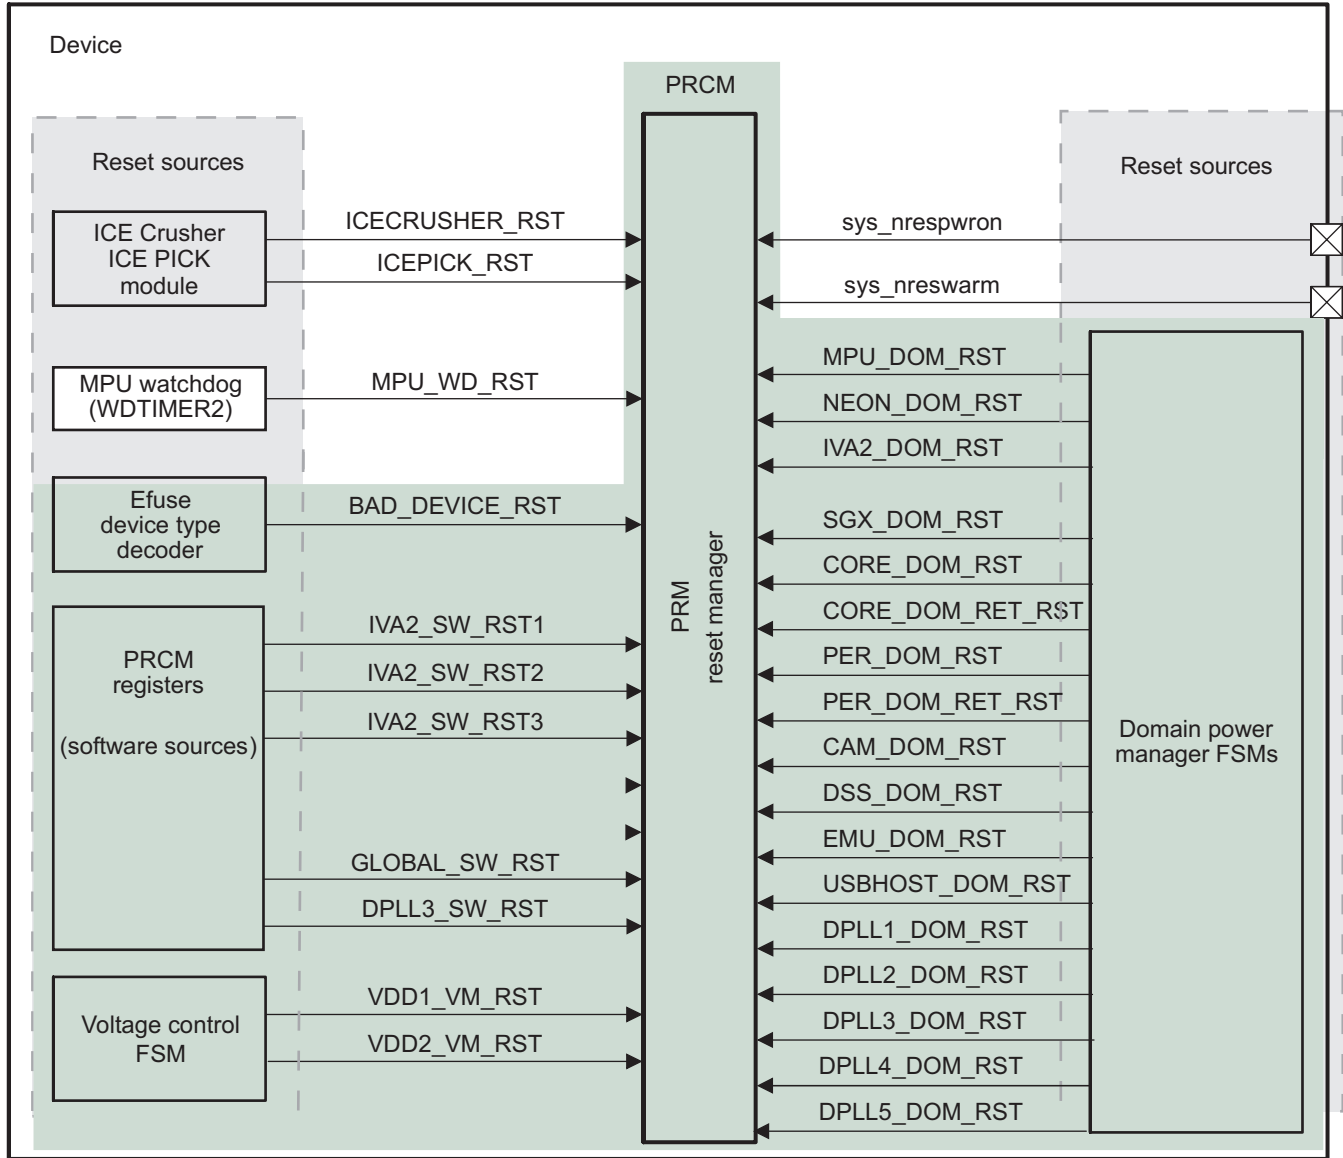

A reset can also be categorized depending on whether it is software-controlled or hardware-triggered:

- Software reset: Triggered by setting a bit in a configuration register of the PRCM module
- Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

### 4.5.3 Reset Sources

Figure 4-21 is an overview of the reset sources.

Figure 4-21. Reset Sources Overview

\*The green region in the figure represents the boundary of the PRCM.

prcm-020

#### 4.5.3.1 Global Reset Sources

Table 4-8 lists the global reset sources of the device. The global reset source signals received by the reset manager trigger the reset of all the device modules. For all hardware reset signals, the source of the reset is identified; for the software reset signals, the reset triggering bit is identified.

Table 4-8. Global Reset Sources

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	sys_nrespwron	Input pin	The entire device is reset on power up.

<sup>(1)</sup> H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

**Table 4-8. Global Reset Sources (continued)**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	BAD_DEVICE_RST	PRCM	Asserted when during the power-up sequence the device is identified as bad, after reading eFuses.
H/W	sys_nreswarm	Bidirectional pin	External hardware warm reset
H/W	SECURE_WD_RST	WDTIMER1	Security watchdog timer overflow reset
H/W	MPU_WD_RST	WDTIMER2	MPU watchdog timer overflow reset
H/W	MPU_SEC_VIOL_RST	OMAP security FSM	Security violation reset request by the OMAP security FSM
S/W	GLOBAL_SW_RST	PRCM.PRM_RSTCTRL[1] RST_GS	Global software reset
H/W	VDD1_VM_RST	PRCM	Asserted by the voltage manager FSMs when no response from the power IC is received during wake-up transition from retention or off mode.
H/W	VDD2_VM_RST	PRCM	
S/W	DPLL3_SW_RST	PRCM.PRM_RSTCTRL[2] RST_DPLL3	Local cold reset for DPLL3 and a global cold reset to the device.
H/W	ICEPICK_RST	ICEPick module	Global warm reset from ICEPick emulation module.

### 4.5.3.2 Local Reset Sources

Table 4-9 lists the local reset sources of the device. A local reset source signal received by the reset manager resets only some of the device modules.

**Table 4-9. Local Reset Sources**

Type <sup>(1)</sup>	Name	Source/Control	Description
H/C	CORE_DOM_RET_RST	PRCM	Asserted only for a power domain state transition from OFF to ACTIVE state
H/C	USB_DOM_RET_RST	PRCM	
H/C	PER_DOM_RET_RST	PRCM	
H/C	MPU_DOM_RST	PRCM	Asserted for any power domain transition from OFF or RETENTION state to ACTIVE state.
H/C	IVA2_DOM_RST	PRCM	
H/C	NEON_DOM_RST	PRCM	
H/C	SGX_DOM_RST	PRCM	
H/C	CORE_DOM_RST	PRCM	
H/C	PER_DOM_RST	PRCM	
H/W	EMU_DOM_RST	PRCM	
H/C	CAM_DOM_RST	PRCM	
H/C	DSS_DOM_RST	PRCM	
H/C	DPLL1_DOM_RST	PRCM	
H/C	DPLL2_DOM_RST	PRCM	
H/C	DPLL3_DOM_RST	PRCM	
H/C	DPLL4_DOM_RST	PRCM	
H/C	DPLL5_DOM_RST	PRCM	
H/W	ICECRUSHER_RST	ICECrusher	Asserted by the ICECrusher module to reset the MPU power domain.
S/W	IVA2_SW_RST1	PRCM.RM_RSTCTRL_IVA2[0] RST1_IVA2	IVA2.2: DSP reset control.
S/W	IVA2_SW_RST2	PRCM.RM_RSTCTRL_IVA2[1] RST2_IVA2	IVA2.2: MMU reset control and video hardware accelerator reset control.

<sup>(1)</sup> H = Hardware reset, S = Software reset, C = Cold reset, W = Warm reset

**Table 4-9. Local Reset Sources (continued)**

Type <sup>(1)</sup>	Name	Source/Control	Description
S/W	IWA2_SW_RST3	PRCM.RM_RSTCTRL_IWA2[2] RST3_IWA2	Video hardware accelerator reset control.

---

**NOTE:** For power domains with <domain name>\_DOM\_RST and <domain name>\_DOM\_RET\_RST, the reset sources are asserted together when the domain transitions from OFF to ON power state, whereas only <domain name>\_DOM\_RET\_RST is asserted on a global or local warm reset.

---

#### 4.5.4 Reset Distribution

Each power domain can contain one power-on reset (RSTPWRON) and one or more reset (RST) signals. These signals behave as follows:

- On any global or local cold reset, both RST and RSTPWRON are asserted.
- On any global or local warm reset, only RST is asserted.

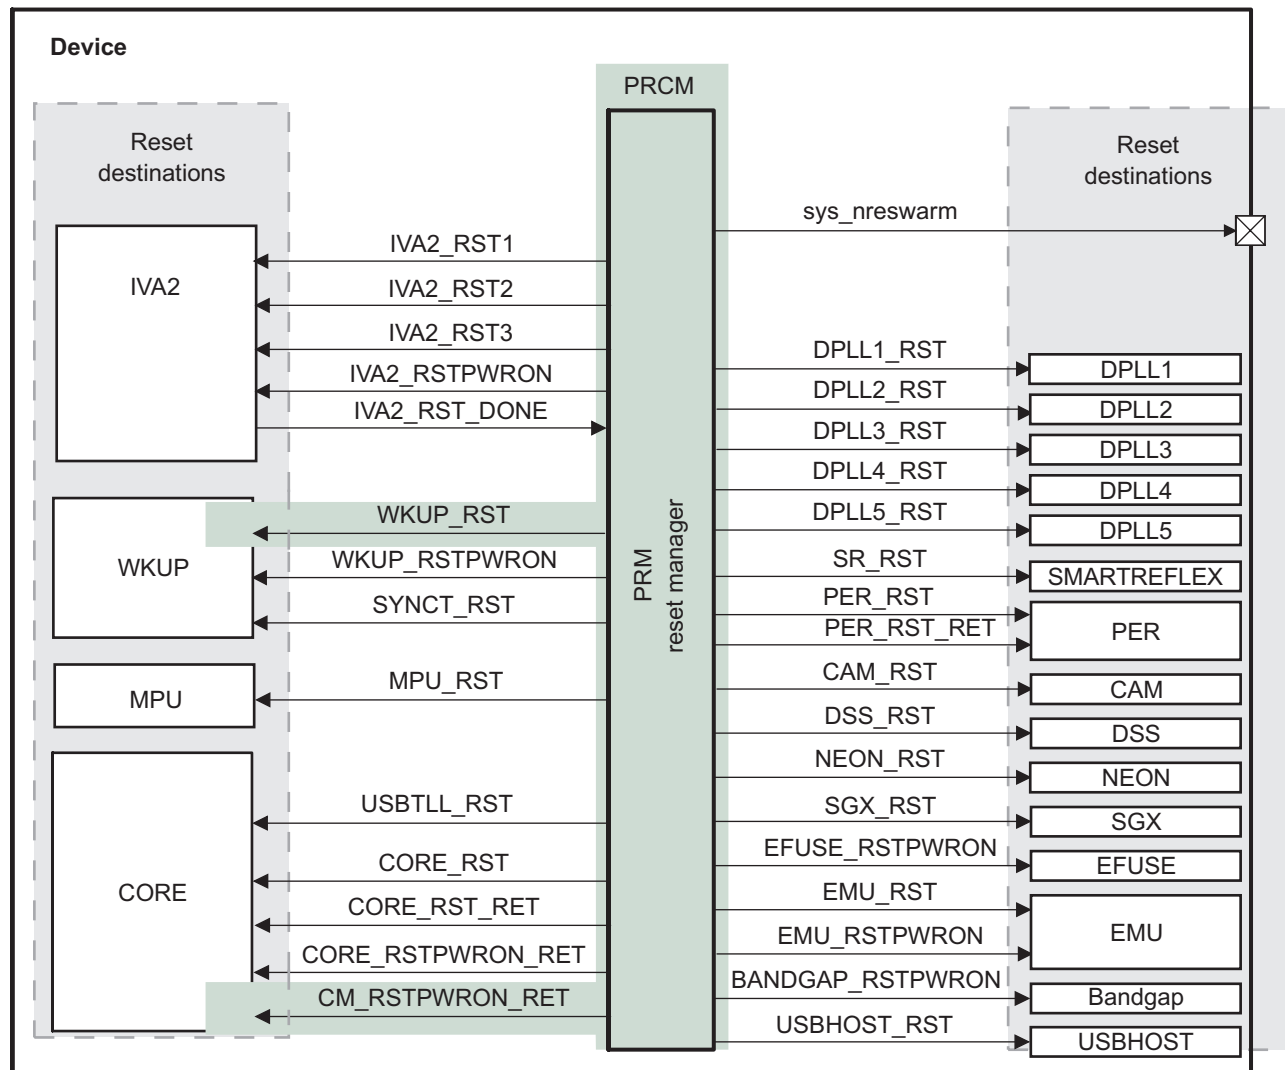

The CORE power domain receives two additional retention logic reset signals: retention reset (RST\_RET) and power-on retention reset (RSTPWRON\_RET). These signals behave as follows:

- On any global cold reset or wakeup from OFF state to ACTIVE state, both RST\_RET and RSTPWRON\_RET are asserted.
- On any global warm reset, only RST\_RET is asserted.
- On wakeup from RETENTION state, these signals are not asserted.

The IVA2 power domain outputs the IVA2\_RST\_DONE signal, which is used to properly handle the synchronous reset scheme of the IVA2.2 subsystem.

Figure 4-22 shows the reset distribution among the 18 power domains.

Figure 4-22. Reset Destinations Overview

\* The green region in the figure represents the boundary of the PRCM

prcm-021

### 4.5.5 Power Domain Reset Descriptions

#### 4.5.5.1 MPU Power Domain

The MPU power domain has two reset input signals and one reset output signal (see [Table 4-10](#)).

Table 4-10. MPU Power Domain Reset Signals

Name	I/O <sup>(1)</sup>	Source/Destination <sup>(2)</sup>	Reset Domain
MPU_RST	I	PRM	Resets the MPU processor core and the asynchronous bridge in the MPU power domain.
MPU_RSTPWRON	I	PRM	Resets the ICECrusher module (cold reset only).
ICECRUSHER_RST	O	PRM	MPU power domain reset from the ICECrusher module.

<sup>(1)</sup> I = Input, O = Output

<sup>(2)</sup> Source for an input signal and destination for an output signal.

**NOTE:** The MPU\_CLK is divided by 2 inside the MPU subsystem to generate the ARM\_FCLK. This divider is only active when the DPLL is locked. (Refer to MPU Subsystem for information on ARM\_FCLK).

#### 4.5.5.2 NEON Power Domain

The NEON power domain has one reset input signal (see [Table 4-11](#)).

**Table 4-11. NEON Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
NEON_RST	I	PRM	Resets the NEON coprocessor

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.3 IVA2 Power Domain

The IVA2 power domain has four inputs and one output reset signal (see [Table 4-12](#)).

**Table 4-12. IVA2 Power Domain Reset Signals**

Name	I/O <sup>(1)</sup>	Source/Destination <sup>(2)</sup>	Reset Domain
IVA2_RST1	I	PRM	Resets the IVA2.2 DSP and part of the two asynchronous bridges in the IVA2 power domain
IVA2_RST2	I	PRM	Resets the IVA2.2 MMU
IVA2_RST3	I	PRM	Resets the video hardware accelerator module
IVA2_RSTPWRON	I	PRM	Performs a power-on reset on the IVA2.2 subsystem. Active on a cold reset only.
IVA2_RSTDONE	O	PRM	Release condition of the IVA_RST1 and RST2. Generated by the IVA2.2 subsystem at the end of the initialization sequence.

<sup>(1)</sup> I = Input, O = Output

<sup>(2)</sup> Source for an input signal and destination for an output signal

#### 4.5.5.4 CORE Power Domain

The CORE power domain has eight input reset signals. (See [Table 4-13](#)).

**Table 4-13. CORE Power Domain Reset Signals**

Name	I/O <sup>(1)</sup>	Source/Destination <sup>(2)</sup>	Reset Domain
CORE_RST	I	PRM	Resets parts of the three asynchronous bridges, MPU INTC, IVA2.2 WUGEN, interconnects, ICR, modem INTC, SAD2D, mailboxes, GPMC, OCM, UART[1..2], HDQ and HS USB, I2C[1..3], McBSP 1 and 5, McSPI [1..3], MMC[1..3], MS-PRO, GPTIMER[10,11], D3D[1,2], SHAM1, RNG, AES[1..2], PKA, SHAM2 and MAD2D2
CORE_RST_RET	I	PRM	Resets part of the SDRC, SDMA, SMS, MPU INTC, and IVA2 WUGEN
CORE_RSTPWRON_RET	I	PRM	Resets part of the SDRC and SCM
CM_RSTPWRON_RET	I	PRM	Resets the clock manager

<sup>(1)</sup> I = Input, O = Output

<sup>(2)</sup> Source for an input signal and destination for an output signal

**Table 4-13. CORE Power Domain Reset Signals (continued)**

Name	I/O <sup>(1)</sup>	Source/Destination <sup>(2)</sup>	Reset Domain
CPEFUSE_RST	I	PRM	Reset the Customer Programmable EFUSE controller. Asserted under the same condition as that of CORE_RST. The CPEFUSE functional clock must be active to release the reset. This clock is enabled by default following a power-on reset. (For the reset sequence, see <a href="#">Section 4.5.9.7.</a> )
USBTLL_RST	I	PRM	Resets the USB TLL asynchronously

The CM logic is reset on:

- Any global cold reset
- A CORE power domain transition from OFF to ON

Because the CM logic is not reset in this case, the CM registers that are sensitive to a warm reset must also be reset synchronously with the L4 clock when a global warm reset occurs.

#### 4.5.5.5 DSS Power Domain

The DSS power domain has one reset input signal (see [Table 4-14](#)).

**Table 4-14. DSS Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
DSS_RST	I	PRM	Resets the entire display subsystem

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.6 CAM Power Domain

The CAM power domain has one reset input signal (see [Table 4-15](#)).

**Table 4-15. CAM Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
CAM_RST	I	PRM	Resets the entire camera subsystem

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.7 USBHOST Power Domain

The USBHOST power domain has one reset input signal (see [Table 4-16](#)).

**Table 4-16. USBHOST Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
USBHOST_RST	I	PRM	Resets the entire HS USB Host subsystem

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.8 SGX Power Domain

The SGX power domain has one reset input signal (see [Table 4-17](#)).

**Table 4-17. SGX Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
SGX_RST	I	PRM	Resets the entire SGX subsystem

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.9 WKUP Power Domain

The WKUP power domain has three reset input signals and two reset output signals (see [Table 4-18](#)).

**Table 4-18. WKUP Power Domain Reset Signals**

Name	I/O <sup>(1)</sup>	Source/Destination <sup>(2)</sup>	Reset Domain
WKUP_RST	I	PRM	Resets the GPTIMER[1,12], WDTIMER2, GPIO 1 and USIMOCP
WKUP_RSTPWRON	I	PRM	Reset the wake-up control module and WDTIMER1
SYNCT_RST	I	PRM	Resets the 32-kHz sync timer. This reset is directly connected to the sys_nrespwrn global reset source.
SECURE_WD_RST	O	PRM	Global warm reset for PRM. Generated by WDTIMER1.
MPU_WD_RST	O	PRM	Global warm reset for PRM. Generated by WDTIMER2.

<sup>(1)</sup> I = Input, O = Output

<sup>(2)</sup> Source for an input signal and destination for an output signal

The PRM logic is reset on any global cold reset. Because the PRM logic is not reset in this case, the PRM registers that are sensitive to a warm reset must also be reset synchronously with the system clock when a global warm reset occurs.

#### 4.5.5.10 PER Power Domain

The PER power domain has two reset input signals (see [Table 4-19](#)).

**Table 4-19. PER Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
PER_RST	I	PRCM	Resets the UART3, McBSP[2,3,4], GPTIMER[2,...,9], WDTIMER3 modules
PER_RST_RET	I	PRCM	Resets the GPIO [2,...,6] modules

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.11 EMU Power Domain

The EMU power domain has three reset input signals and one reset output signal (see [Table 4-20](#)).

**Table 4-20. EMU Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source <sup>(2)</sup>	Reset Domain
ICEPICK_RSTPWRON	I	PRM	ICEPick module
EMU_RSTPWRON	I	PRM	Resets the EMU modules
EMU_RST	I	PRM	Resets the L4 EMU
ICEPICK_RST	O	PRM	Global warm reset from ICEPick

<sup>(1)</sup> I = Input; O = Output

<sup>(2)</sup> Source for an input signal and destination for an output signal

The major part of the emulation/trace modules is reset only at power up.

#### 4.5.5.12 SmartReflex Power Domain

The SmartReflex power domain has one reset input signal (see [Table 4-21](#)).

**Table 4-21. SmartReflex Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
SR_RST	I	PRCM	Resets the SR1 and SR2 modules

<sup>(1)</sup> I = Input, O = Output

#### 4.5.5.13 DPLL Power Domains

The DPLL power domains for DPLL1, DPLL2, DPLL3, DPLL4 and DPLL5 each have one reset input signal.

**Table 4-22. DPLL Power Domain Reset Signals**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
DPLL1_RSTPWON	I	PRCM	Resets the DPLL1 module
DPLL2_RSTPWON	I	PRCM	Resets the DPLL2 module
DPLL3_RSTPWON	I	PRCM	Resets the DPLL3 module
DPLL4_RSTPWON	I	PRCM	Resets the DPLL4 module
DPLL5_RSTPWON	I	PRCM	Resets the DPLL5 module

<sup>(1)</sup> I = Input, O = Output

They are asserted for any type of global cold reset.

#### 4.5.5.14 EFUSE Power Domain

The EFUSE power domain has one reset input signal (see [Table 4-23](#)).

**Table 4-23. EFUSE Power Domain Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
EFUSE_RSTPWON	I	PRCM	Resets the eFuse controller

<sup>(1)</sup> I = Input, O = Output

This signal is asserted for any type of global cold reset and when the device wakes up from off mode.

#### 4.5.5.15 BANDGAP Logic

The BANDGAP logic has one reset input signal (see [Table 4-24](#)).

**Table 4-24. BANDGAP Logic Reset Signal**

Name	I/O <sup>(1)</sup>	Source	Reset Domain
BANDGAP_RSTPWON	I	PRCM	Resets the BANDGAP logic

<sup>(1)</sup> I = Input, O = Output

This signal is asserted for any type of global cold reset and when the device wakes up from off mode.

#### 4.5.5.16 External Warm Reset Assertion

Figure 4-23 shows the external warm reset interface.

Figure 4-23. External Warm Reset Interface

Any global reset source (internal or external) causes `sys_nreswarm_out` to be driven and maintained at the boundary of the device for at least the amount of time configured in the `PRCM.PRM_RSTTIME[7:0] RSTTIME1` bit field. This ensures that the device and its related peripherals are properly reset together.

**NOTE:** Because the system warm-reset output is implemented on a bidirectional pad, any input pulse on `sys_nreswarm` causes a global warm reset.

#### 4.5.6 Reset Logging

The reset in the device is logged in two ways. First, dedicated registers in the PRCM (that is, the `RM_RSTST_<power domain>` and `PRM_RSTST` registers) log the reset source. Second, the SCM also logs the device reset activity in dedicated registers, for security purposes.

##### 4.5.6.1 PRCM Reset Logging Mechanism

The reset status registers (`RM_RSTST_<power domain>` and `PRM_RSTST`) are reset asynchronously on assertion of a global cold reset. However, a reset status bit is always logged when the reset is released to the domain.

For this reason, after the assertion of a global cold reset, the reset status register is cleared to 0. When the domain reset is released, the register bit to log the global cold reset (that is, the `RM_RSTST_<power domain> [0] GLOBALCOLD_RST` bit) is updated to 1. For the same reason, the reset status register of domains released from reset by software is updated only when software releases the domain reset.

The assertion of a global cold reset prevents logging any other source of reset until after the release of the domain reset. This is valid in the following situations:

- A source of reset other than global cold reset is asserted before, during, or after the active period of a global cold source of reset and before the release of the domain reset signal.
- A source of reset other than global cold reset was asserted and then released, but a global cold reset source was asserted before the release of the domain reset signal.

##### 4.5.6.2 SCM Reset Logging

The PRM exports reset the activity status signals to the SCM. For security purposes, the SCM uses these signals to log a reset status in the `SCM.CONTROL_SEC_STATUS` register. The reset activity status signal is asserted high when any source of reset to the power domain is active.

It also provides reset status for the following global reset signals:

- Global cold reset
- Global warm reset

- Global warm secure watchdog reset (SECURE\_WD\_RST)
- Global warm security violation reset (MPU\_SEC\_VIOL\_RST)

There is one reset activity status signal for each of the following power domains:

- CAM
- CORE
- DSS
- EMU
- SGX
- IVA2
- MPU
- NEON
- PER
- USBHOST

These signals are asserted high on assertion of any source of reset on the domain and logged. For information about the SCM, see the *System Control Module* chapter.

#### **4.5.7 Reset Management Overview**

The reset management structure in the device can be considered as a 2-layered structure composed of multiple instances of the reset manager. In the first layer, a top-level reset manager, called the device reset manager, handles all the sources of global reset (cold and warm). It provides reset managers for the second layer, called local reset managers, and the global reset and global power-on reset signals.

Each power domain has a minimum of one local reset manager. The local reset manager also receives resets, such as the software reset and domain power transition reset, from the local reset source for the power domain.

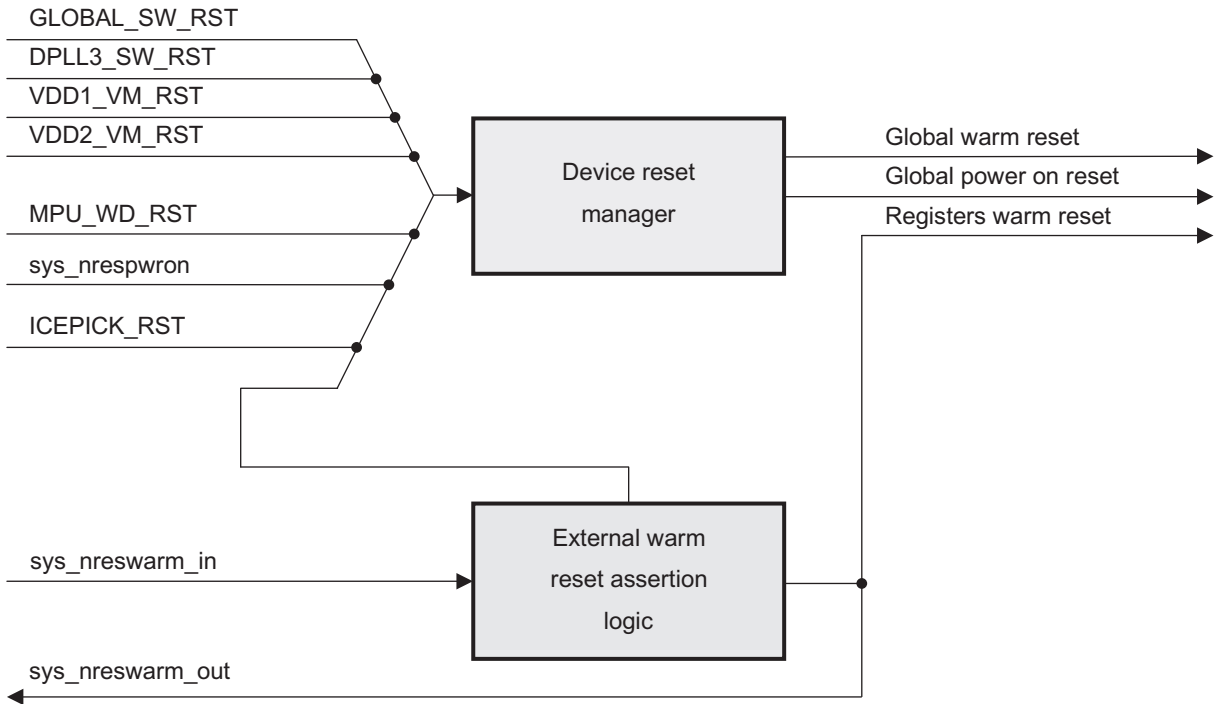

[Figure 4-24](#) through [Figure 4-27](#) provide an overview of reset management in the device. They do not provide reset sequencing between the reset managers.

---

**NOTE:** The power domain must be ready (that is, the domain clocks must be active) before its reset is released.

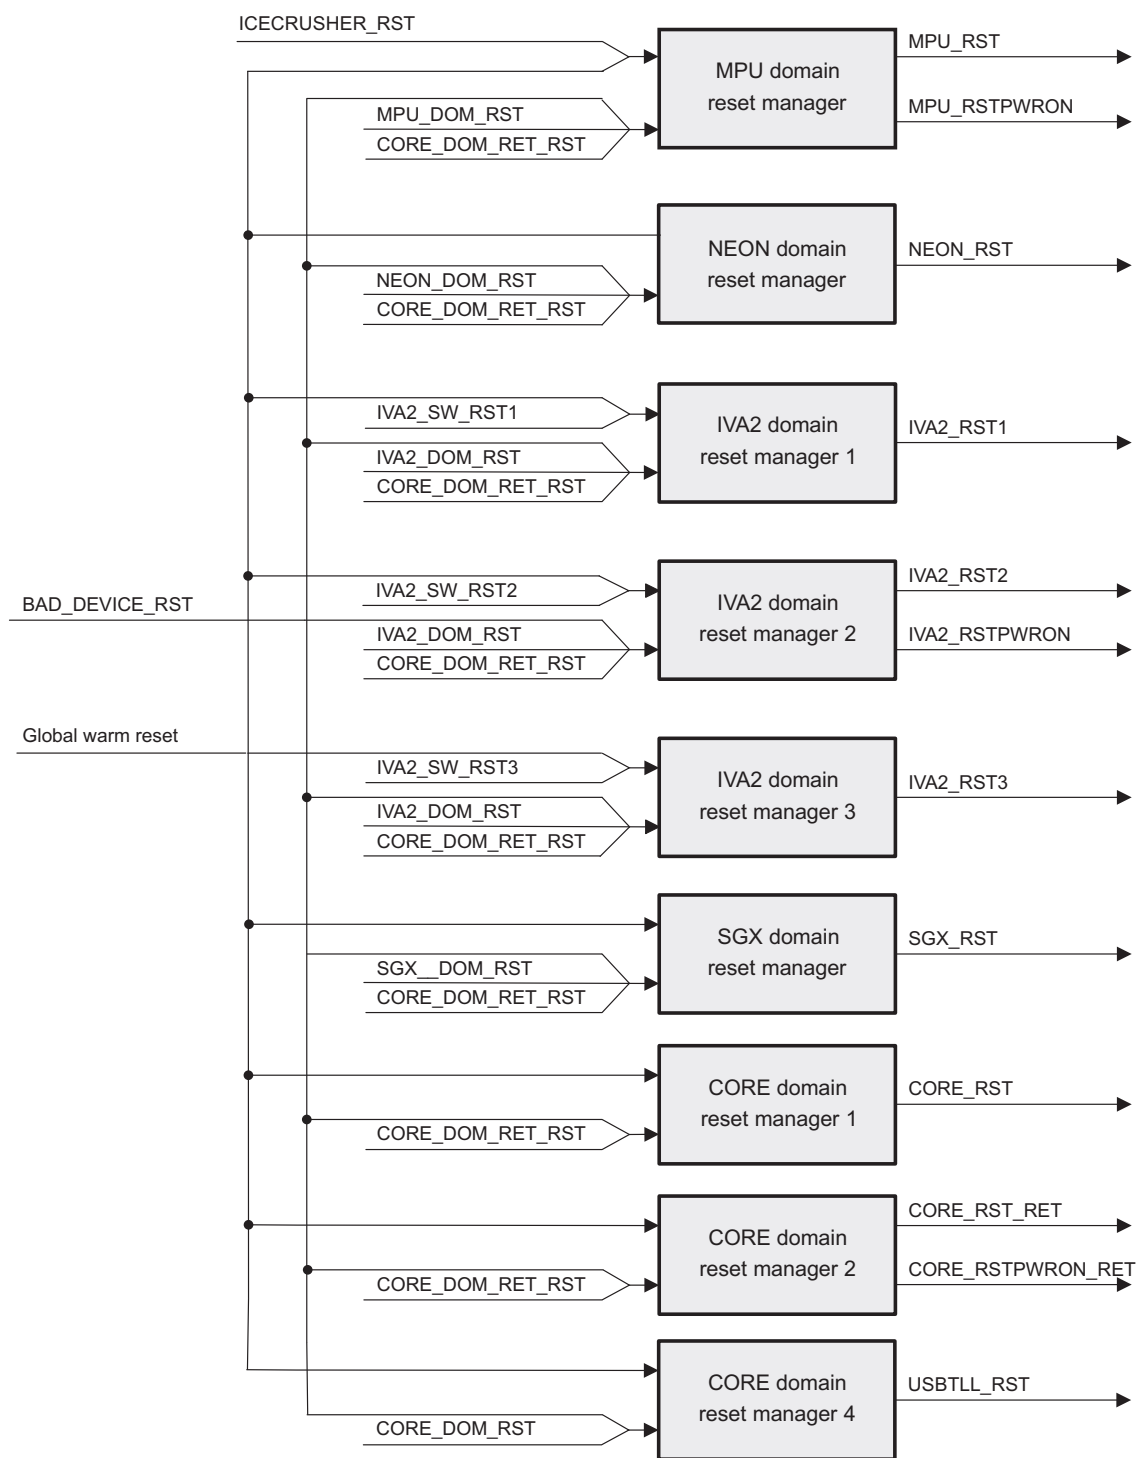

---

## 4.5.9 Reset Sequences

### 4.5.9.1 Power-Up Sequence

The power-up sequence shown in [Figure 4-28](#) is:

---

**NOTE:** For further information regarding sequencing of the input/output signal on the device pads during the power up sequence, please refer to the OMAP35x Data Manual.

---

1. Voltages ramp up and global power-on reset is asserted by the external power IC:
  - vdds, vdds\_mem, vdds\_wkup\_bg, vdds\_sram voltage rails are ramped up.
  - sys\_nrespwron is asserted (i.e., to low).
  - vdds\_dpll\_dll and vdds\_dpll\_per voltage rails are ramped up before release of sys\_nrespwron (i.e. transition to high).
  - The VDD3 voltage domain LDO (WKUP Power domain) tracks vdds\_wkup voltage rail and automatically ramps up.
  - After VDD3 voltage domain stabilization, the power IC ramps-up VDD2 voltage domain.
  - After VDD2 voltage domain stabilization, the power IC ramps-up VDD1 voltage domain.
2. Source clock stabilizes:
  - The 32-kHz input clock and the system clock oscillator stabilize.
  - The device reset manager holds the whole device under reset.
  - The system clock (SYS\_CLK) is on.
3. The global power-on reset sys\_nrespwron released (i.e., to high) when vdds\_dpll\_dll and vdds\_dpll\_per voltage rails are stabilized.
4. The eFuse farm reset is released.
5. Internal memory LDO ramps up:
  - Processor memories LDO (VDD4 voltage domain) is ramped up.
  - CORE memories LDO (VDD5 voltage domain) is ramped up.
  - The PRCM module waits for internal memory LDO stabilization.
6. Global resets are released. Global power-on reset and global warm reset are extended (remain asserted) on release of the external power-on reset until the following conditions are met:
  - Voltages are stable in the processor power domains, CORE power domain, and WKUP power domain.
  - System clock is stable.
  - Internal memory LDO is stable.
  - Device reset manager counter overflows (set up by the PRCM.PRM\_RSTTIME[7:0] RSTTIME1 bit field).
  - Hardware condition, such as eFuse farm ready, is set.
7. The PRM\_RSTPWON reset and DPLL reset of the four DPLLs (DPLL1, 2, 3, and 4) are released.
8. The CM\_SYS\_CLK clock starts running (gating logic is enabled).
9. The CM\_RSTPWON\_RET reset is released.
10. The DPLLs reset is released.
11. The DPLL3\_ALWON\_FCLK clock starts to run (gating logic is enabled).
12. The L3\_ICLK clock starts to run.
13. The DPLL1\_ALWON\_FCLK clock starts to run (logic controlling the clock-gating conditions element is clocked and the clock is requested).
14. The CORE\_RST reset is released.
15. The MPU\_CLK clock starts to run.
16. The MPU boots.

**NOTE:**

- The IVA2 power domain is held under reset after power up by assertion of the software source of reset.
- Power domains such as DSS, CAM, SGX, and NEON are held under reset after power up until the MPU software enables the power domain interface clocks.

**Figure 4-28. Power-Up Sequence**

prcm-096

### 4.5.9.2 Global Warm Reset Sequence

This section describes the global reset sequence (see [Figure 4-29](#)).

The assumptions are:

- vdds, vdds\_mem, vdds\_dpll\_pll, vdds\_dpll\_per, vdds\_wkup\_bg and vdds\_sram power rails are regulated at 1.8 V.
- VDD2 voltage domain (vdd\_core power rail) is regulated at 1.0 V.
- VDD1 voltage domain (vdd\_mpu\_iva power rail) is regulated at 1.2 V.
- VDD3, VDD4, and VDD5 voltage domains are regulated at 1.2 V.
- The system is running:
  - Resets are released.
  - CORE DPLL and processor DPLL are locked.

The steps of a global warm reset sequence are as follows:

1. Upon assertion of the warm reset source:
  - The device reset manager resets part of the device by asserting the global warm reset.
  - The external warm reset (sys\_nreswarm\_out) is asserted.
  - All the power domain warm resets are asserted.
  - DPLL1 and DPLL3 transit to bypass mode. DPLL2, DPLL4 and DPLL5 transit to stop mode. The system clock, SYS\_CLK, continues running at system clock frequency.
  - The registers sensitive to a warm reset are synchronously reset (PRM and CM register sets).
  - The CM cuts all the clocks not requested, according to the register reset value settings.
2. The global warm reset is released and extended after release of the warm reset source until the following conditions are met:
  - Device reset manager counter overflows (set up by the PRCM.PRM\_RSTTIME[7:0] RSTTIME1 bit field)
  - Voltage domains (VDD1, VDD2, VDD4 and VDD5) are stable.

---

**NOTE:** Voltage stabilization is an additional condition if voltage scaling was performed before the assertion of the warm reset.

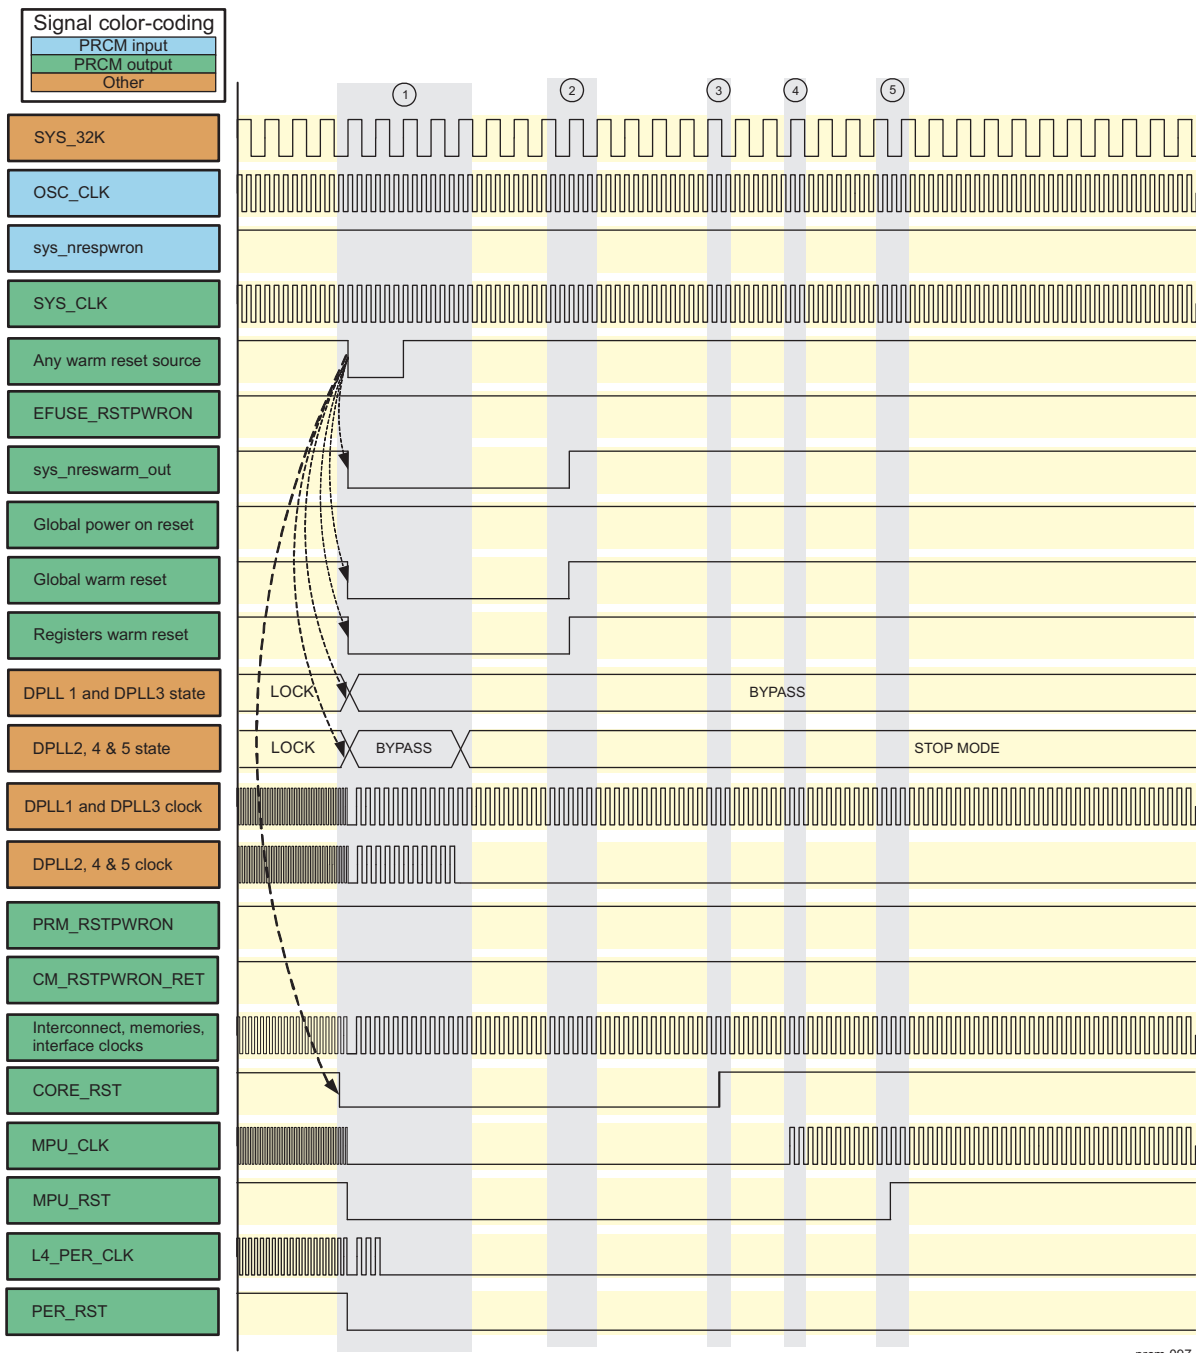

---

3. The CORE domain is released from reset (warm sensitive modules in CORE power domain).
4. The MPU\_CLK clock is running.
5. The MPU power domain is released from reset. The MPU boots.

**NOTE:**

- The IVA2 power domain is held under reset after global warm reset by assertion of the software source of the reset.
  - Power domains such as PER, DSS, CAM, SGX, and NEON are held under reset after global warm reset until the MPU software enables their interface clock.
-

Figure 4-29. Warm Reset Sequence

prcm-097

### 4.5.9.3 IVA2.2 Subsystem Power-Up Sequence

Figure 4-30 shows the power-up reset sequence and timing relationships of the IVA2.2 subsystem.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released except for the software sources of reset.

The sequence is:

1. Software enables the IVA2.2 subsystem clock.
2. Software clears the PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bit. The PRM releases the IVA2\_RSTPWRON reset signal when reset manager 2 in the IVA2 power domain times out.
3. On release of IVA2\_RSTPWRON, the IVA2.2 subsystem performs an initialization sequence.
4. The IVA2.2 subsystem asserts the IVA2\_RST\_DONE signal when initialization completes.
5. PRM releases the IVA2\_RST2 reset signal.
6. The PRCM.RM\_RSTST\_IVA2[9] IVA2\_SW\_RST2 status bit is updated accordingly on release of the IVA2\_RST2 reset signal. The MPU software can now program the MMU or download the DSP code.
7. Software clears the PRCM.RM\_RSTCTRL\_IVA2[0] RST1\_IVA2 bit. The PRM waits for reset manager 1 in the IVA2 power domain to time out.
8. The PRM can release the IVA2\_RST1 reset signal. The DSP boots.
9. The PRCM.RM\_RSTST\_IVA2[8] IVA2\_SW\_RST1 status bit is updated accordingly on release of the IVA2\_RST1 reset signal.
10. DSP software enables the video hardware accelerator clock.
11. DSP software clears the PRCM.RM\_RSTCTRL\_IVA2[2] RST3\_IVA2 bit. The PRM waits for reset manager 3 in the IVA2 power domain to time out.
12. After reset manager 3 times out, the PRM can release the IVA2\_RST3 reset signal. The SEQ boots.
13. The PRCM.RM\_RSTST\_IVA2[10] IVA2\_SW\_RST3 status register bit is updated accordingly on release of the IVA2\_RST3 reset signal.

Figure 4-30. IVA2.2 Subsystem Power-Up Reset Sequence

prcm-029

#### 4.5.9.4 IVA2 Software Reset Sequence

Figure 4-31 shows the software reset sequence and timing relationships of the IVA2.2 subsystem.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released.
- The software ensures that the IVA2.2 subsystem software sources of reset are not asserted while the IVA2 power domain clocks are running.
- The software clears the previous reset status.

The sequence is:

1. DSP software puts the SEQ in idle, and can safely assert the IVA2 power domain software reset.
2. The PRM asserts the IVA2\_RST3 reset asynchronously.
3. The DSP goes to idle, and the CM can gate the IVA\_CLK clock.
4. MPU software can safely assert the IVA2.2 subsystem software reset.
5. The PRM asserts all remaining IVA2 power domain warm resets asynchronously.
6. MPU software enables the IVA2 power domain clock. A partial initialization sequence is performed.
7. MPU software clears the PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bit.
8. The IVA2.2 subsystem asserts the IVA2\_RST\_DONE signal when initialization completes.
9. The PRM releases the IVA2\_RST2 reset signal when reset manager 2 in the IVA2 power domain times out.
10. The PRCM.RM\_RSTST\_IVA2[9] IVA2\_SW\_RST2 status bit is updated accordingly on release of the IVA2\_RST2 reset signal. MPU software now program the MMU or download the DSP code.
11. Software clears the PRCM.RM\_RSTCTRL\_IVA2[0] RST1\_IVA2 bit. The PRM waits for reset manager 1 in the IVA2 power domain to time out.
12. After reset manager 1 times out, the PRM can release the IVA2\_RST1 reset signal. The DSP boots.
13. The PRCM.RM\_RSTST\_IVA2[8] IVA2\_SW\_RST1 status bit is updated accordingly on release of the IVA2\_RST1 reset signal.
14. DSP software enables the SEQ clock.
15. DSP software clears the PRCM.RM\_RSTCTRL\_IVA2[2] RST3\_IVA2 bit. The PRM waits for reset manager 3 in the IVA2 power domain to time out.
16. The PRM can release the IVA2\_RST3 reset signal. The SEQ boots.
17. The PRCM.RM\_RSTST\_IVA2[10] IVA2\_SW\_RST3 status bit is updated accordingly on release of the IVA2\_RST3 reset signal.

Figure 4-31. IVA2 Software Reset Sequence

prcm-030

#### 4.5.9.5 IVA2 Global Warm Reset Sequence

Figure 4-32 shows the reset sequence of the IVA2.2 subsystem and timing relationships on a global warm reset.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2.2 subsystem are released.
- Software clears the previous reset status.

The sequence is:

1. A global warm reset source is asserted (see `sys_nreswarm` in Figure 4-32).
2. The PRM asserts asynchronously all IVA2 power domain warm reset signals (and all other warm reset signals).
3. The `PRCM.RM_RSTCTRL_IVA2` register is reset to its default value. As a result, the IVA2 power domain warm reset signals stay asserted on release of the global warm source of reset.
4. DPLL2 is held under its reset configuration; the IVA2 power domain clocks are stopped.
5. The `sys_nreswarm` global warm source of reset is de-asserted.
6. The `PRCM.RM_RSTST_IVA2` status register is updated accordingly when the device reset manager times out.
7. The MPU boots and the MPU software sequence, shown in Section 4.5.9.4, from point 6, starts.

Figure 4-32. IVA2 Global Warm Reset Sequence

prcm-031

#### 4.5.9.6 IVA2 Power Domain Wake-Up Cold Reset Sequence

Figure 4-33 shows the cold reset sequence of the IVA2.2 subsystem when the IVA2 power domain transitions from RETENTION to ON power state.

The assumptions are:

- The MPU is running.
- All sources of reset to the IVA2 are released.
- The software ensures that the IVA2 power domain software sources of reset are not asserted while the IVA2 clocks are running.
- The software clears the previous reset status.

The sequence is:

1. DSP software puts the SEQ into INACTIVE state.
2. MPU software programs the IVA2 power domain to go into RETENTION power state during the next sleep transition.
3. The DSP goes to idle mode, and the CM gates the IVA2 clock. The IVA2 power domain enters the INACTIVE power state.
4. The IVA2 power domain enters the RETENTION power state.
5. The IVA2 power domain is wakened.
6. The PRM asserts the cold reset IVA2\_RSTPWRON and all IVA2 warm resets asynchronously.
7. The PRCM.RM\_RSTCTRL\_IVA2[2] RST3\_IVA2 bit is automatically reset to its reset value.
8. The IVA2 power domain is inactive.
9. IVA2 clocks are automatically reenabled. The IVA2 power domain enters the ACTIVE power state.
10. The PRM releases the IVA2\_RSTPWRON reset signal when reset manager 2 in the IVA2 power domain times out.
11. On release of IVA2\_RSTPWRON, the IVA2 performs an initialization sequence.
12. The PRCM.RM\_RSTST\_IVA2 status register is updated accordingly on release of the IVA2\_RSTPWRON reset signal.
13. The IVA2.2 subsystem asserts the IVA2\_RSTDONE signal when initialization completes.
14. The PRM can release the IVA2\_RST1 and IVA2\_RST2 reset signals. The DSP boots in autonomous mode.
15. DSP software enables the SEQ clock.
16. DSP software clears the PRCM.RM\_RSTCTRL\_IVA2[2] RST3\_IVA2 bit. The PRM waits for reset manager 3 in the IVA2 power domain to time out.
17. After reset manager 3 times out, the PRM can release the IVA2\_RST3 reset signal. The SEQ boots.
18. The PRCM.RM\_RSTST\_IVA2[10] IVA2\_SW\_RST3 bit is updated accordingly on release of the IVA2\_RST3 reset signal.

Figure 4-33. IVA2 Power Domain Power Transition Reset Sequence

prcm-032

There are two alternate sequences:

- The DSP is held under reset when exiting the RETENTION power state. This is done when MPU software writes 1 to the PRCM.RM\_RSTCTRL\_IVA2[0] RST1\_IVA2 bit. In this case, the MPU software must clear this bit to 0 to reboot the DSP.
- Both the DSP and MMU are held under reset when exiting the RETENTION power state (the MPU software writes 1 to the PRCM.RM\_RSTCTRL\_IVA2[0] RST1\_IVA2 and PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bits). In this case, the MPU software must first clear the PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bit to allow the release of the reset IVA\_RSTPWON and subsequently (after initialization) the release of IVA2\_RST2. Only after the MPU software re-programs the MMU or downloads the DSP code can it clear the PRCM.RM\_RSTCTRL\_IVA2[0] RST1\_IVA2 bit field to boot the DSP.

---

**NOTE:**

- Although the IVA2.2 WUGEN module and DPLL2 are part of the IVA2.2 subsystem, they are also part of the CORE power domain and the DPLL2 power domain, respectively. They are reset independently from the IVA2 power domain.
  - The IVA2\_RSTPWON reset is released by software by programming the PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bit. Setting the PRCM.RM\_RSTCTRL\_IVA2[1] RST2\_IVA2 bit does not assert IVA2\_RSTPWON.
  - IVA2\_RST3 is asserted when the IVA2 power domain transitions from OFF or RETENTION state to ON state. The corresponding bit in the PRCM.RM\_RSTCTRL\_IVA2 register is automatically set to 1 during this transition.
  - The release of the IVA2\_RST3 reset is stalled as long as the IVA2\_RST2 reset is not released.
  - The release of the IVA2\_RST2 and IVA2\_RST1 resets causes IVA2 to de-assert the IVA2\_RSTDONE signal.
- 

#### 4.5.9.7 CPEFUSE Reset Sequence

In the CPEFUSE reset sequence, Customer Programmable EFUSE is coupled with the SCM. Whenever the SCM is reset, the CPEFUSE cells are sensed. This sequence is initiated by the PRCM module and the SCM (hardware-controlled) after a device cold reset or the CORE power domain wakes up from the OFF power state. Under these conditions, the CM part of the PRCM is released from reset, and, according to the configuration of the PRCM.CM\_FCLKEN3\_CORE[0] EN\_CPEFUSE bit, the CPEFUSE functional clock is automatically restarted and the CPEFUSE\_RST reset is released (de-asserted). The SCM completes the autoloading sequence of the CPEFUSE. Software must poll the autoloading completion status bit in the SCM before switching off the CPEFUSE functional clock.

Whenever the software must blow a CPEFUSE, it must ensure that the functional clock is enabled; it starts the autoloading sequence by programming the SCM.

Whenever the CORE power domain wakes up from open-switch retention, the CPEFUSE module is reset. However, its functional clock is not restarted, because the CM part of the PRCM is not reset, and the autoloading sequence is not performed. Software must first enable the CPEFUSE functional clock; this releases the CPEFUSE\_RST reset. Software must then start the autoloading sequence by programming the control module, which is not reset in this situation.

For information about the SCM, see the *System Control Module* chapter.

## 4.6 PRCM Power Manager Functional Description

### 4.6.1 Overview

#### 4.6.1.1 Introduction

To efficiently manage leakage and reduce dynamic power consumption, the device supports several power-management techniques:

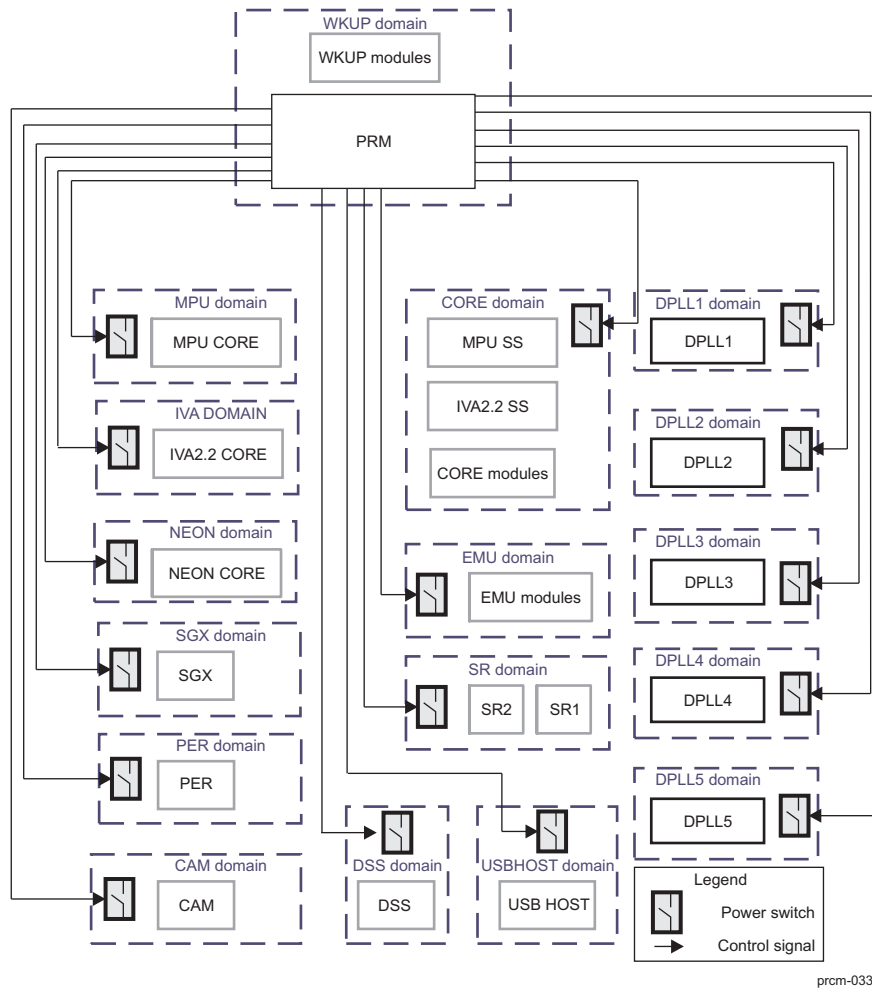

- Dynamic clock-gating conditions
- DVFS
- DPS
- SLM

These power-management techniques require software control and specific hardware features. The hardware features are fully controlled by the PRM part of the PRCM. These features are:

- Device partitioning into 18 power domains
- Device partitioning into several voltage domains communicating through level shifters
- Logic power-switch control
- RFF control
- Memory power-switch control
- Embedded LDOs (SRAMs, wakeup, emulation) control
- I/O off-mode control
- Level shifter control
- External power IC control

[Figure 4-34](#) is an overview of PRM power management in the device:

Figure 4-34. Power Control Overview

prcm-033

#### 4.6.1.2 Device Partitioning

To substantially reduce leakage in sleep modes (SLM strategy) and to optimize active power-consumption savings (DPS strategy), the device is segmented into 18 power domains:

- MPU: Application processor
- NEON: Multimedia coprocessor
- IVA2: DSP
- SGX: Graphics engine
- CORE: Interconnect, memory controllers, peripherals, and clock management
- DSS: Display subsystem
- CAM: Camera controller
- PER: Low-power uses cases peripherals
- WKUP: Wakeup (always active)
- USBHOST: USB HOST power domain
- EMU: Emulation
- SMARTREFLEX: SmartReflex modules
- EFUSE: eFuse farm
- DPLL1: MPU DPLL
- DPLL2: IVA2.2 DPLL

- DPLL3: CORE DPLL
- DPLL4: Peripherals DPLL
- DPLL5: Peripherals DPLL2

Each power domain receives power through an independent switch controlled by the PRM module. In this way, depending on the application scenario, unused power domains) can be switched off or put in RETENTION state while others remain active.

[Table 4-27](#) lists the device modules split over the power domains.

**Table 4-27. Power Domain Modules**

<b>Power Domain</b>	<b>Modules</b>
MPU	MPU core ICE-crusher CS MPU async bridge (master) SSM

#### 4.6.1.3 Memory and Logic Power Management

Device power domains can have separate control for logic and memory. This depends on the power domain implementation in the device (for details, see [Section 4.6.2, Power Domain Implementation](#)).

Generally, separate switches allow separate management of the logic and memory power states in a power domain.

Memory banks in the MPU (L2 cache), IVA2 (L1, L1 flat, L2, L2 flat), CORE (CORE memory banks 1 to 6), SGX, CAM, DSS, USBHOST, and EMU power domain memories have their own voltage and power control, independent from the logic. However, the user must ensure that memory states are programmed consistently with the logic state.

MPU L1 cache memory does not have an independent control and is supplied with the MPU logic.

CORE memory bank 3,4, 5, and 6 are associated to the domain power state and controlled with the domain logic.

MPU and IVA2 memories are supplied by a common LDO (VDD4). CORE, SGX, CAM, DSS, USBHOST, and EMU memories are supplied by another LDO (VDD5).

#### 4.6.1.4 Power Domain States

Each power domain can be driven by the PRM to four different states, depending on the functional mode required by the user. Power domain states are hardware-defined and depend on the domain clock activity and domain memory/logic switch states.

[Table 4-28](#) defines the power states a power domain can reach in the device.

**Table 4-28. Power Domain States**

Power State	Power		Clocks
	Logic	Memory	
ACTIVE	On	On, retention, or off	On (at least one)
INACTIVE	On	On, retention, or off	CORE Power Domain Clock-Gating ControlsOff (all clocks)
RETENTION (CSWR)	On	Retention or off	Off (all clocks)
RETENTION (OSWR)	Off/RFF		
OFF	Off	Off	Off (all clocks)

**NOTE:**

- Closed-switch retention (CSWR): Full domain logic supply is maintained, and supply voltage can be dropped to minimize leakage.
- Open-switch retention (OSWR): Full domain logic is switched off, but the context is saved for modules that embed RFFs.
- Throughout the rest of this chapter all references to retention state must explicitly state whether it is CSWR or OSWR. Any reference to retention state that does not explicitly state whether it is CSWR or OSWR applies to both retention states.

In CSWR and OSWR, memories are put in RETENTION or can also be switched off.

---

#### 4.6.1.5 Power State Transitions

For each power domain, the PRM manages all transitions controlling domain clocks, domain resets, domain logic power switches, memory power switches, and memory retention.

As previously mentioned, a power domain is characterized by four different power states: ACTIVE, INACTIVE, RETENTION, and OFF.

A transition is a passage from one state to another.

Two types of power state transitions are possible:

- Sleep: Moving from a higher consumption power state (ACTIVE) to a lower consumption power state (INACTIVE, RETENTION, or OFF)
- Wake-up: Moving directly from a lower consumption power state (INACTIVE, RETENTION, or OFF) to the ACTIVE power state

For instance, a power domain with initiators and target modules in standby and idle modes operates an ACTIVE-to-INACTIVE transition. It is then ready to operate an INACTIVE-to-RETENTION or OFF transition, depending on the requirements.

The device supports eight transitions:

- ACTIVE => INACTIVE
- INACTIVE => ACTIVE
- ACTIVE => RETENTION
- RETENTION => ACTIVE
- ACTIVE => OFF
- OFF => ACTIVE

#### 4.6.1.6 Device Power Modes

A device power mode is a specific functional combination of the power states of all the power domains of the device.

Unlike power domain states (see [Section 4.6.1.4](#)), device power modes are not hardware-defined; they are defined by software as relevant combinations of the power domain states.

There are two types of device power modes:

- Active: Any valid combination of power domain states in which one or several domains are still active, regardless of whether any software is running
- Standby: Any valid combination of power domain states in which all the domains are in INACTIVE, RETENTION, or OFF state

---

**NOTE:** All power domain states are hardware-supported, thereby preventing electrical damage to the device. However, software ensures that the power domain states are set correctly, to result in a valid device power mode and ensure correct functioning.

---

### 4.6.1.7 Isolation Between Power Domains

When switching a power domain from one state to another, the PRCM automatically manages domain output isolation to prevent electrical damage.

This mechanism is hardware-supervised and does not require software action.

## 4.6.2 Power Domain Implementation

### 4.6.2.1 Device Power Domains

Table 4-29 summarizes the power mode implementation in the device and the control granularity for each power and memory domain.

**Table 4-29. Domain Power Control Summary**

Functional Domain or Subsystem	Power Domain	PRCM Power Control Type
MPU	MPU	Logic ON-OFF
	NEON	Logic ON-OFF
	CORE	Logic ON-OFF
	EMU	Logic ON-OFF
	L1 cache SRAM	Logic ON-OFF
	L2 cache SRAM	ON-OFF BB retention
	IVA2.2	IVA2
IVA2.2	CORE	Logic ON-OFF Logic retention
	L1 cache SRAM	ON-OFF BB retention
	L1 flat cache SRAM	ON-OFF BB retention
	L2 cache SRAM	ON-OFF BB retention
	L2 flat cache SRAM	ON-OFF BB retention
	Misc SRAM	Logic ON-OFF

CORE		Logic ON-OFF Logic retention
CORE (interconnect, memory controllers, peripherals)	SRAM bank 1	ON-OFF BB retention
	SRAM bank 2	ON-OFF BB retention
	OSWR SRAM 3	Logic ON-OFF

**Table 4-29. Domain Power Control Summary (continued)**

Functional Domain or Subsystem	Power Domain	PRCM Power Control Type
		BB retention
	CSWR SRAM bank 4	ON-OFF
		BB retention
PERIPHERALS	PER	Logic ON-OFF
		Logic retention
WKUP	WKUP	none
	EMU	Logic ON-OFF
EMULATION	ETB SRAM	ON-OFF
		BB retention
SmartReflex	SR1, SR2	Logic ON-OFF
EFUSE	eFuse farm	none
MPU DPLL	DPLL1	Logic ON-OFF
IVA2.2 DPLL	DPLL2	Logic ON-OFF
CORE DPLL	DPLL3	Logic ON-OFF
Peripherals DPLL	DPLL4	Logic ON-OFF
Peripherals DPLL2	DPLL5	Logic ON-OFF

**NOTE:**

- BB: Back-bias or local memory retention
- OSWR: Open-switch retention
- CSWR: Closed-switch retention
- LDO retention: All memories are in BB mode and the memory array is dropped down.
- Logic ON-OFF: Memory is controlled together with the logic (and does not support retention).
- OSWR SRAM bank 3: Corresponds to memories that must be retained whenever the CORE OSWR mode is activated (the CORE context is maintained only by keeping RFFs alive). These memories are scratchpad, SDMA, and SMS.
- CSWR SRAM bank 4: Corresponds to memories that are retained only in case of CSWR (all logic is maintained with reduced voltage). These memories are USB and MAILBOXES.

The CORE power domain has 6 memory blocks. Of these 6, the power state of only two memory blocks: SRAM bank 1 and SRAM bank 2, can be configured vis-a-vis the domain power state, through software setting of the corresponding bitfields in the PRCM.PM\_PWSTCTRL\_CORE register. The power states of the rest of the memory banks is automatically controlled by the PRCM (i.e., hardware controlled) and no software setting is possible.

The memory bank 5 of the CORE power domain is used for the USB TLL module save and restore operations. (refer to [Section 4.8.6](#)). Similarly, the memory bank 6 is for the System Control Module save and restore feature (refer to the *System Control Module* chapter).

**NOTE:** Before initiating a domain sleep transition (ON to OFF) on both MPU and CORE power domain it must be ensured that the CORE memory banks are configured to automatically switch to ON power state when the CORE power domain wakes-up (OFF to ON). This is need for proper boot-up sequence.

This is done by setting PM\_PWSTCTRL\_CORE [19:18] MEM2ONSTATE bit field to 0x3 and PM\_PWSTCTRL\_CORE [17:16] MEM1ONSTATE bit field to 0x3.

### 4.6.2.2 Power Domain Memory Status

The PRCM module logs the memory status in the SCM.CONTROL\_SEC\_STATUS register. The memory status is logged for CORE power domain memory banks 1 and 2 (OCM RAM) and for the L1 and L2 caches of the MPU.

Two statuses are logged for each memory bank:

- Memory is destroyed: The memory array is powered down.
- Memory is not accessible: The memory array is powered down or is in RETENTION.

For information about the SCM, see the *System Control Module* chapter.

### 4.6.2.3 Power Domain State Transition Rules

As previously described, a power domain can reach different states. These states are linked both to the power applied to the domain and to the domain clock activity.

Any power state transition always depends on and starts with power domain clock activity control. Any active clock in a power domain sets the domain as ACTIVE (see [Section 4.6.2.1](#)). Therefore, a sleep transition always starts by shutting down the power domain clocks. For more information about power domain clock controls, see [Section 4.7, Clock Manager Functional Description](#).

When all clocks are shut down in a power domain, transitions from INACTIVE-to-OFF or INACTIVE-to-RETENTION can occur.

Similarly, when a wake-up transition occurs between a lower-power domain state and a higher one, the transition to ACTIVE state becomes effective when the required clocks are restarted.

[Section 4.8, Idle and Wake-Up Management](#), describes both sleep and wake-up transitions.

### 4.6.2.4 Power Domain Dependencies

Besides the inner conditions to operate a state transition on a single power domain, the device offers hardwired and software-programmable dependencies between the power domains.

Two kinds of dependencies exist:

- Sleep dependencies: Used to start a sleep transition on a power domain only if the related power domains are in mute mode (not requesting any service from the linked power domain)
- Wake-up dependencies: Used to initiate a wake-up transition on a power domain as a consequence of a linked power domain wake-up transition

Two dedicated sets of registers (PRCM.CM\_SLEEPDEP\_<domain> and PRCM.PM\_WKDEP\_<domain>) allow the setting of programmable dependencies.

[Section 4.8.5, Sleep and Wake-Up Dependencies](#), summarizes the possible dependency combinations between power domains.

### 4.6.2.5 Power Domain Controls

#### 4.6.2.5.1 Power Domain Hardware Control

Each power domain in the device is controlled by a dedicated power state controller (PSCON) in the PRCM module. The PSCON provides circuit level control over the power management features (switches, isolation, retention).

When a state transition occurs for a given power domain, the related PSCON automatically manages the sequence.

Device power domain implementation also depends on hardwired dependencies, both sleep and wake-up transitions, between power domains. This means a single power domain transitions from one power state to another depending on the states and transitions of the linked domains.

For details about the dependencies between power domains, see [Section 4.8, Idle and Wake-Up Management](#), and [Section 4.12, Basic Programming Model](#).

#### 4.6.2.5.2 Power Domain Software Controls

If all conditions are met to initiate a power domain state transition (that is, all the modules are idle/standby and the related clocks are shut down), the PRCM automatically manages the transition according to the following settings:

- Dependencies setting: The PRCM.CM\_SLEEPDEP\_<domain> registers and PRCM.PM\_WKDEP\_<domain> registers are used to set/clear programmable dependencies between power domains.

Not all dependencies are programmable by software; some are hardwired and thus do not allow any control. For more information about the dependencies between power domains, see [Section 4.8, Idle and Wake-Up Management](#), and [Section 4.12, Basic Programming Model](#).

- Power state transitions setting: The transitions of each power domain state can be controlled by software through a set of dedicated status registers (PRCM.PM\_PWSTCTRL\_<domain\_name>) that allow the configuration of the power state into which the domain enters after completing a transition (PRCM.PM\_PWSTCTRL\_<domain\_name>[1:0] POWERSTATE bit field). These status registers are used to check the current state of the logic and memories in a power domain and to learn about any ongoing state transition.

Also, if the power domain offers different settings for the logic and memory, the PRCM.PM\_PWSTCTRL\_<domain\_name> registers allow the selection of the state to which the logic and memory will go when the power domain is put in RETENTION. They also allow the selection of the state to which the memory will go when the power domain is put into ON state.

These features depend on each power domain implementation. For details, see [Section 4.12, Basic Programming Model](#), and [Section 4.14, PRCM Registers Manual](#).

- Event generator: Three registers (PRCM.PM\_EVGENCTRL\_MPU, PRCM.PM\_EVGENONTIM\_MPU, and PRCM.PM\_EVGENOFFTIM\_MPU) allow the MPU power domain to be switched between on and off (or placed in inactive mode). The PRCM.PM\_EVGENONTIM\_MPU and PRCM.PM\_EVGENOFFTIM\_MPU registers are used to set the durations of the on and off modes, respectively.

For details, see [Section 4.12, Basic Programming Model](#), and [Section 4.14, PRCM Registers Manual](#).

## 4.7 PRCM Clock Manager Functional Description

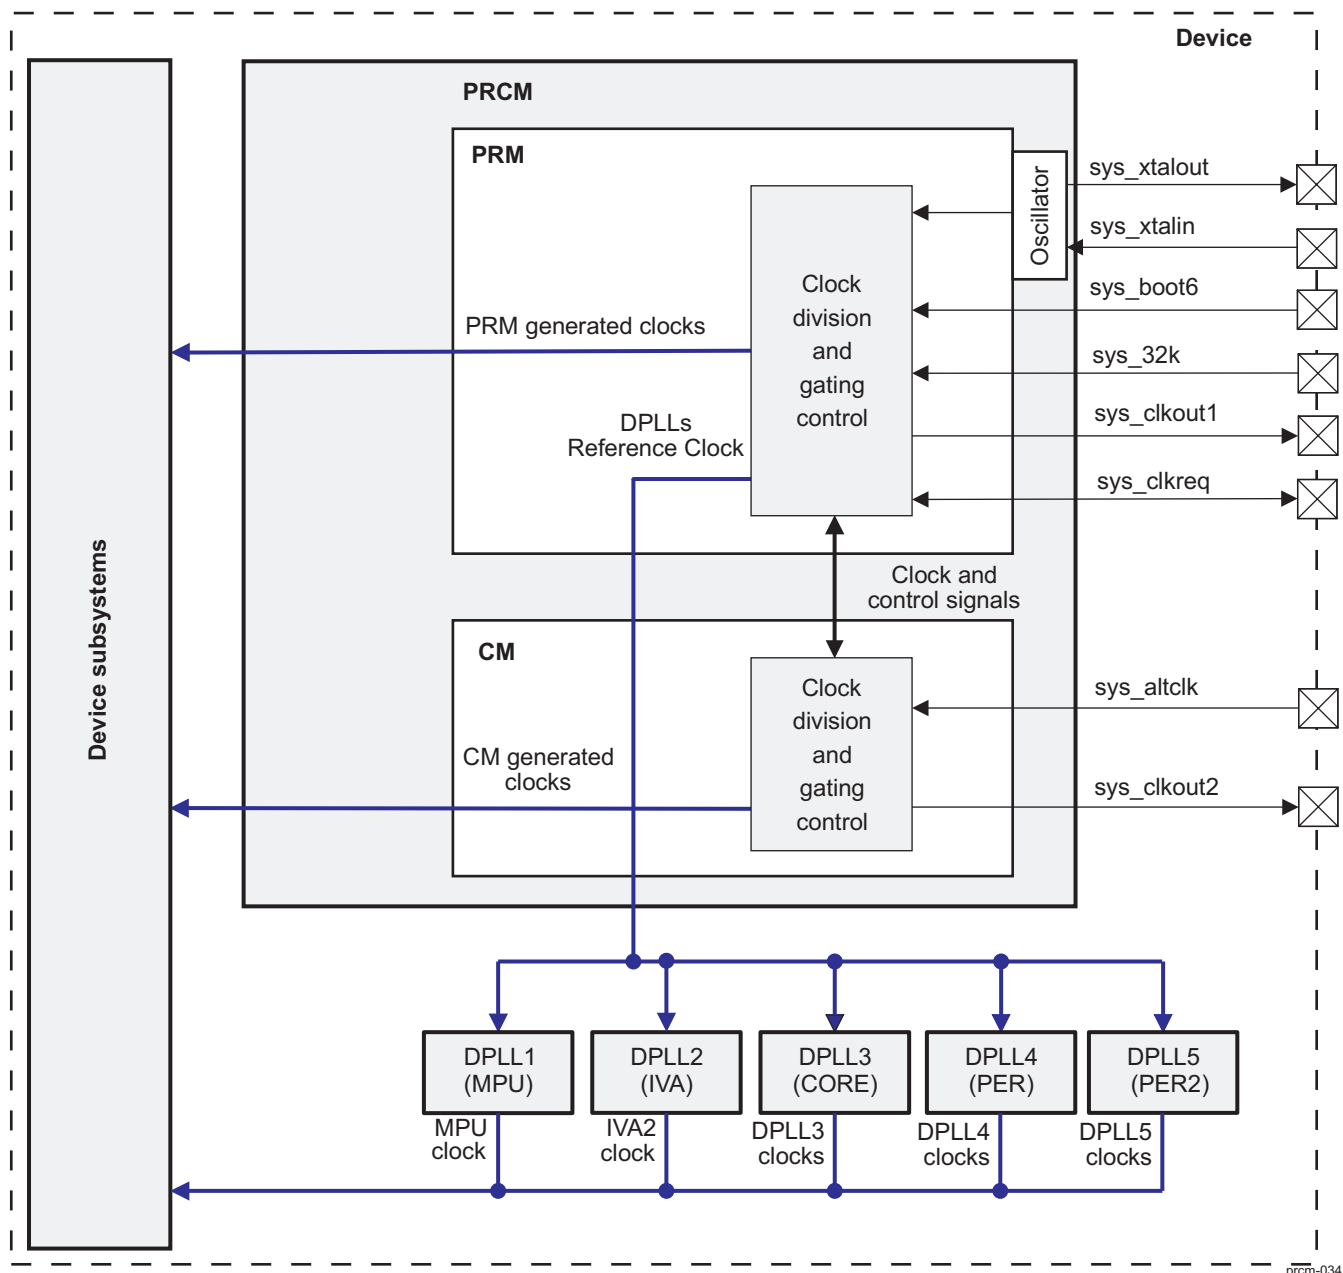

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

### 4.7.1 Overview

The PRCM module provides control for clock generation, division, distribution, synchronization, and gating. It distributes the clock sources to all the modules in the device.

The device-level clock generation is handled by internal oscillators (the system clock oscillator and the 32-kHz oscillator for secure clock) and DPLLs; clock division and gating are handled by the PRM and the CM sections of the PRCM. Figure 4-35 shows the high-level clock-management scheme in the device.

Figure 4-35. PRCM Clock Manager Overview

prcm-034

### 4.7.1.1 Interface and Functional Clocks

The PRCM propagates two kinds of clocks:

- Interface clock: Ensures proper communication between any module and the system interconnects (L3 or L4). In most cases, the interface clock supplies the interface and registers of the module. For some modules, the interface clock is also used as the functional clock.
- Functional clock: Supplies the functional part of a module or subsystem. In some cases, a module or subsystem may require several functional clocks.

To be operational, a module requires functional clock(s); to communicate with other modules, it requires an interface clock. For example, the functional clock of a general-purpose timer (GPTIMER) must be active for it to run, but its interface clock can be turned off.

A module can use one or more optional functional clocks. Because an optional functional clock is used only for specific features of the module, it can be shut down without stopping the module activity (for example, 54 MHz for the DSS power domain and 96 MHz for the CAM power domain).

### 4.7.2 External Clock I/Os

Figure 4-36 shows the external clock I/Os of the device.

Figure 4-36. External Clock I/O

#### 4.7.2.1 External Clock Inputs

##### 4.7.2.1.1 32-kHz Always-On Clock

The `sys_32k` input pin supplies the 32-kHz always-on clock (32K\_FCLK clock). This clock is used for low-frequency operation (timers, denouncing, etc.). It also supplies the WKUP power domain for operation in the lowest power mode.

##### 4.7.2.1.2 High-Frequency System Clock

The high-frequency system clock (SYS\_CLK) is either supplied to the device from an external clock source through the `sys_xtalin` input pin or is generated internally by a local system clock crystal oscillator. In the latter case, a crystal is connected between the `sys_xtalout` and `sys_xtalin` device pins. The `sys_boot[6]` pin is used to set the oscillator operating mode (see Figure 4-14).

The source system clock can be 12, 13, 16.8, 19.2, 26, or 38.4 MHz and is internally divided by 2 to provide the standard frequencies (26 MHz and 34.8 MHz become 13 MHz and 19.2 MHz, respectively; the native 12, 13, and 19.2 MHz remain unchanged). It supplies the reference to the DPLLs and is also used by several modules. The system clock is activated in the device after the device power-on reset is released by the reset manager in the PRCM module.

The source-clock selection register (PRCM.PRM\_CKSEL [2:0] SYS\_CLKIN\_SEL bit field) is set by the software to identify the input frequency of the system clock.

Table 4-30 provides the system clock input configurations.

**Table 4-30. System Clock Input Configurations**

Input Source	Device Pin Mapping	Description
Quartz	sys_xtalin and sys_xtalout	Internal oscillator is enabled.
Square clock (1.8-V CMOS signal)	sys_xtalin (sys_xtalout is not connected)	Internal oscillator is bypassed.

**NOTE:** An external pullup or pulldown tied on the sys\_boot6 input pin of the device determines whether the internal oscillator is used (oscillator mode) or an external clock source is supplied to the sys\_xtalin input pin (bypass mode).

#### 4.7.2.1.3 Alternate Clock

The sys\_altclk pin can be used to provide an alternate 54-MHz, 48-MHz, or any other frequency clock.

#### 4.7.2.2 External Clock Outputs

The device can output two clocks externally:

- sys\_clkout1 can output an oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) at any time. The output oscillator clock can be controlled either by software or externally using sys\_clkreq control. When the device is in OFF state, sys\_clkreq can be asserted to enable the oscillator and activate sys\_clkout1 without waking up the device. The OFF state polarity of sys\_clkout1 is programmable.
- sys\_clkout2 can output sys\_clk (12, 13, 16.8, 19.2, 26, or 38.4 MHz), core\_clk (CORE DPLL output), or 96-MHz or 54-MHz clocks. It can be divided by 2, 4, 8, or 16, and its OFF state polarity is programmable. This output is active only when the CORE power domain is ACTIVE. Also, the selected source clock must be enabled by software. Enabling sys\_clkout2 does not automatically request the required source clock.

#### 4.7.2.3 Summary

Table 4-31 summarizes the external clock I/O.

**Table 4-31. External Clock I/Os**

Name	I/O <sup>(1)</sup>	Source/Destination	Description
sys_xtalin	I	Oscillator	Main input clock. Crystal oscillator clock (only at 12, 13, 16.8, or 19.2 MHz) or CMOS digital clock (at 12, 13, 16.8, 19.2, 26, or 38.4 MHz).
sys_xtalout	O	Oscillator	Output of oscillator
sys_clkout1	O	PRCM	Configurable output clock 1
sys_clkout2	O	PRCM	Configurable output clock 2
sys_32k	I	PRCM	32-kHz clock input
sys_altclk	I	PRCM	Alternate selectable clock source for UARTs or NTSC/PAL. It can be 54 MHz, 48 MHz, or any frequency.

<sup>(1)</sup> I = Input, O = Output

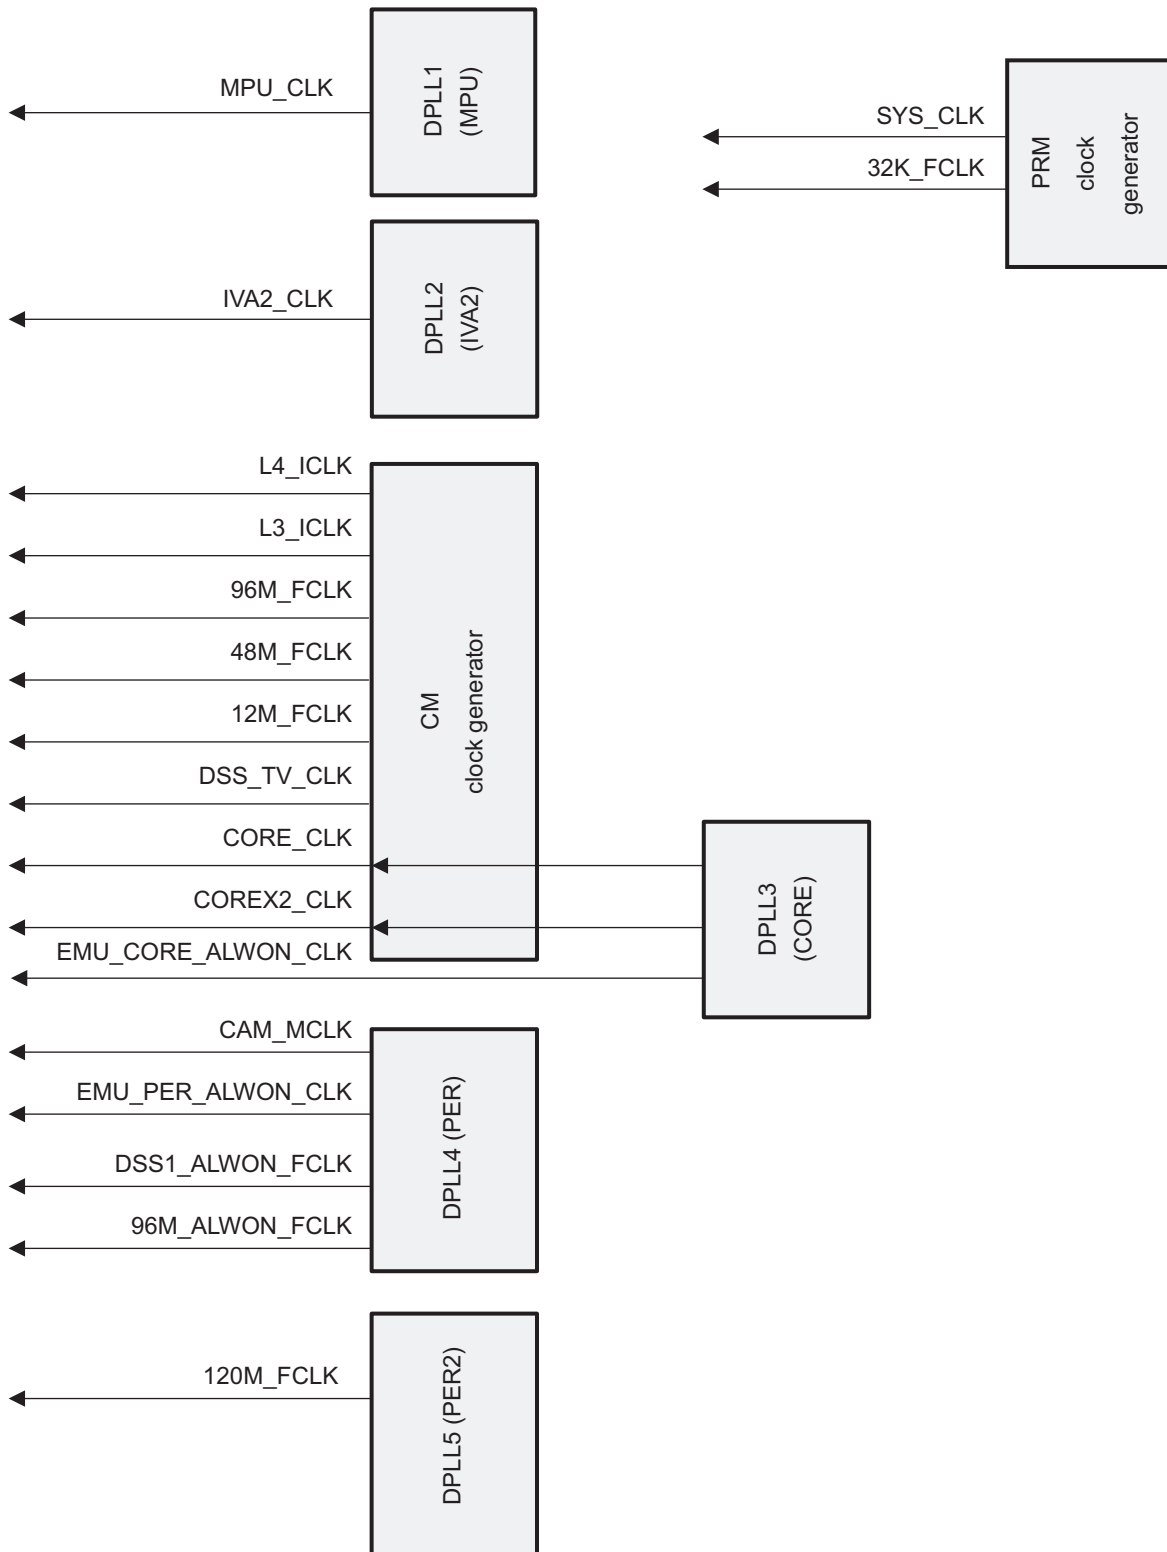

### 4.7.3 Internal Clock Generation

The device generates internal clocks from four sources:

- PRM
- CM
- DPLLs
- 32-kHz oscillator

[Figure 4-37](#) shows the internal clock generation scheme of the device.

Figure 4-37. Internal Clock Sources

prcm-036

#### 4.7.3.1 PRM

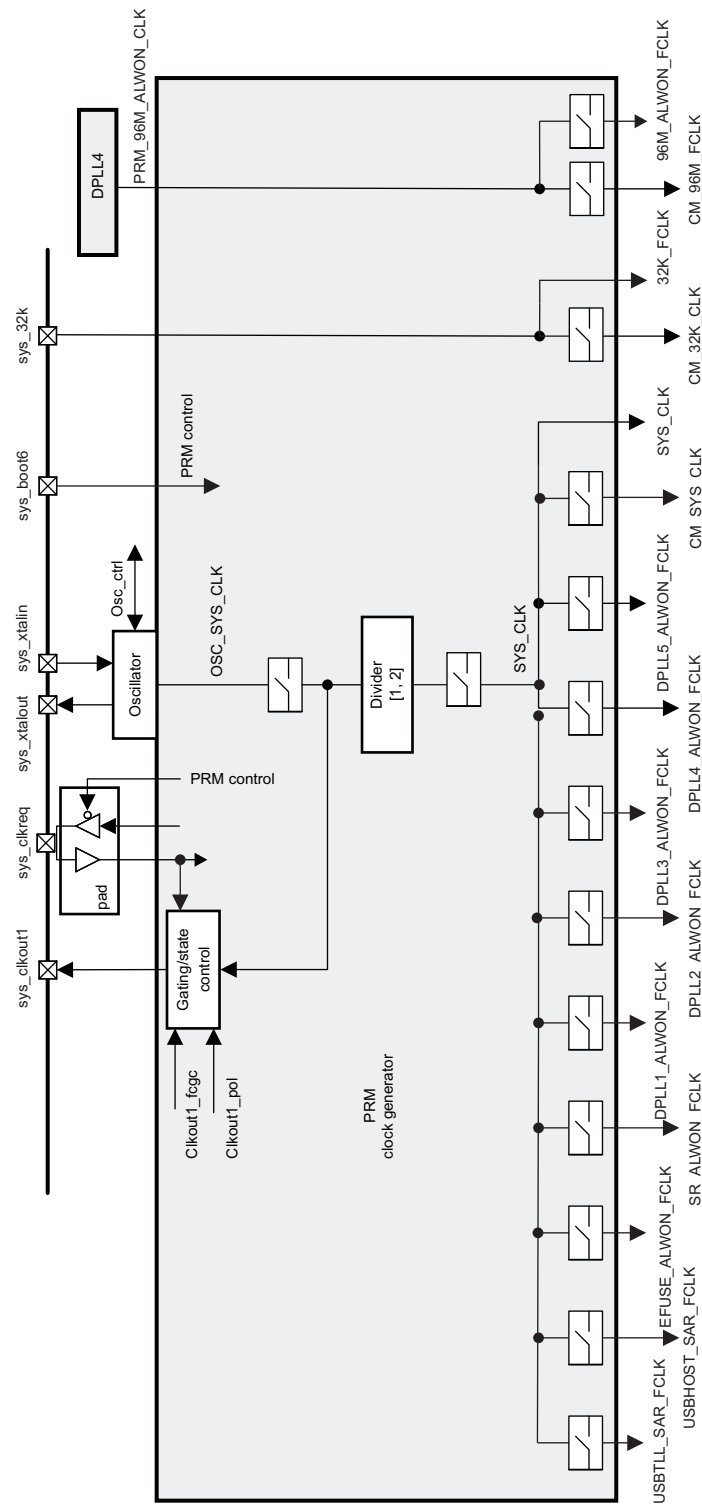

The PRM resides in the WKUP power domain. It handles the generation of the 32-kHz low-frequency clocks and the high-frequency system clocks from the SYS\_CLK. It also manages the clock oscillator and the external clock output `sys_clkout1`.

SYS\_CLK is generated by the internal oscillator or supplied as the external clock signal on the `sys_xtalin` pin. It supplies most of the clocks in the device. Some of the device clocks sourced by SYS\_CLK are always powered (clocks are present even when the CORE power domain is in the OFF state). SYS\_CLK is also the source of the WKUP power domain interface clocks.

It also handles the gating and distribution of the 96-MHz clock from DPLL4 to the CM and the PER power domain modules.

[Figure 4-38](#) is the functional overview of the PRM. The other clocks in the figure are explained in the following sections.

Figure 4-38. PRCM Clock Generator

prcm-037

### 4.7.3.2 CM

The CM clock generator generates interface clocks and peripheral functional clocks for most of the modules. It also controls DPLL3, DPLL4, and the external peripheral clock output sys\_clkout2 (see [Figure 4-39](#)).

The CM is in the CORE power domain, which can be powered off. When the CORE power domain is powered off, the clocks are not available, and their OFF state is latched. The DPLL controls are also latched. The RFF architecture ensures that the full CM setting is saved when the CORE power domain goes into RETENTION state, and is transparently restored when it reactivates.

DPLL3 receives SYS\_CLK from the PRM and generates CORE\_CLK through the CM. CORE\_CLK is the source for the interface clocks (L3 and L4) and the functional clock. The L3 and L4 interface clocks supply the device interconnects and all module interface clocks. The L4 clock is divided for USB (full-speed clock limitation at 50 MHz) and to supply the reset managers (PRM) in the WKUP power domain. The clocks derived from CORE\_CLK are fully balanced over the device.

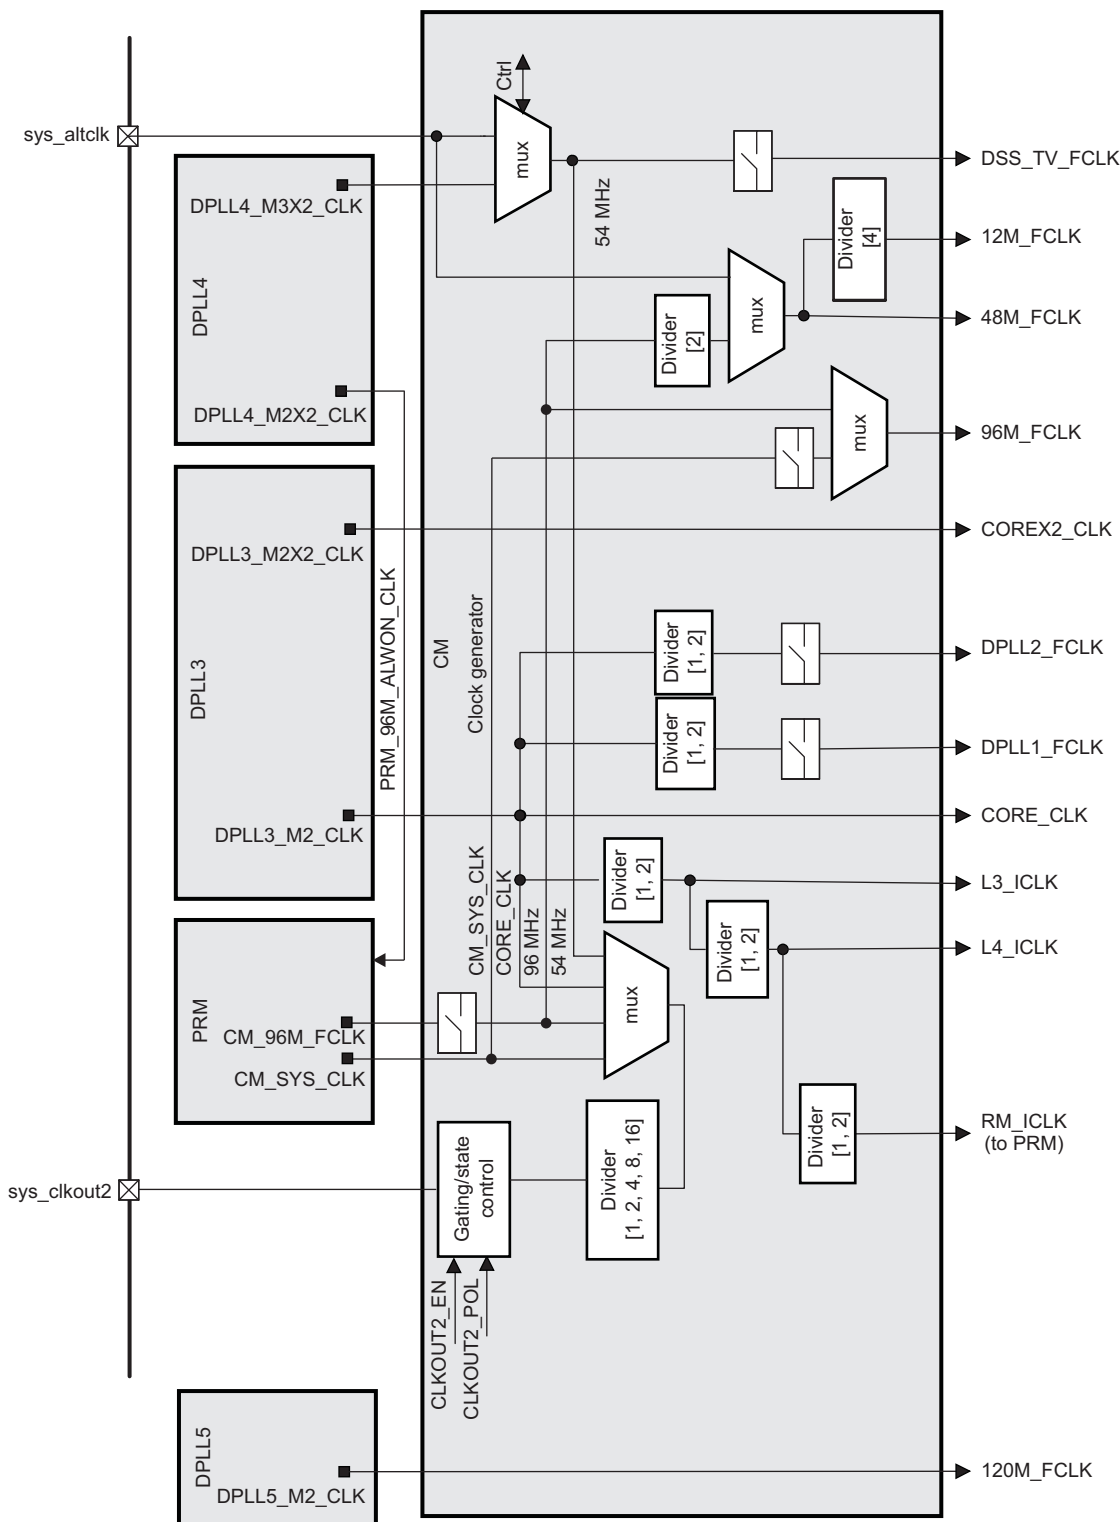

The 96M\_FCLK, 48M\_FCLK, and 12M\_FCLK clocks are functional unbalanced clocks for a number of modules in the CORE and PER power domains.

The functional 96-MHz clock path can be bypassed with SYS\_CLK to allow a peripheral such as I<sup>2</sup>C to be functional while the DPLL4 is not yet powered-on. The default configuration after initial power-on is bypassed with the system clock. Software must switch to the DPLL-generated clock after programming the proper system settings.

The 96-MHz clock input from PRM to the CM (that is, CM\_96M\_FCLK) is internally gated by the CM.

[Figure 4-39](#) is the functional overview of the CM.

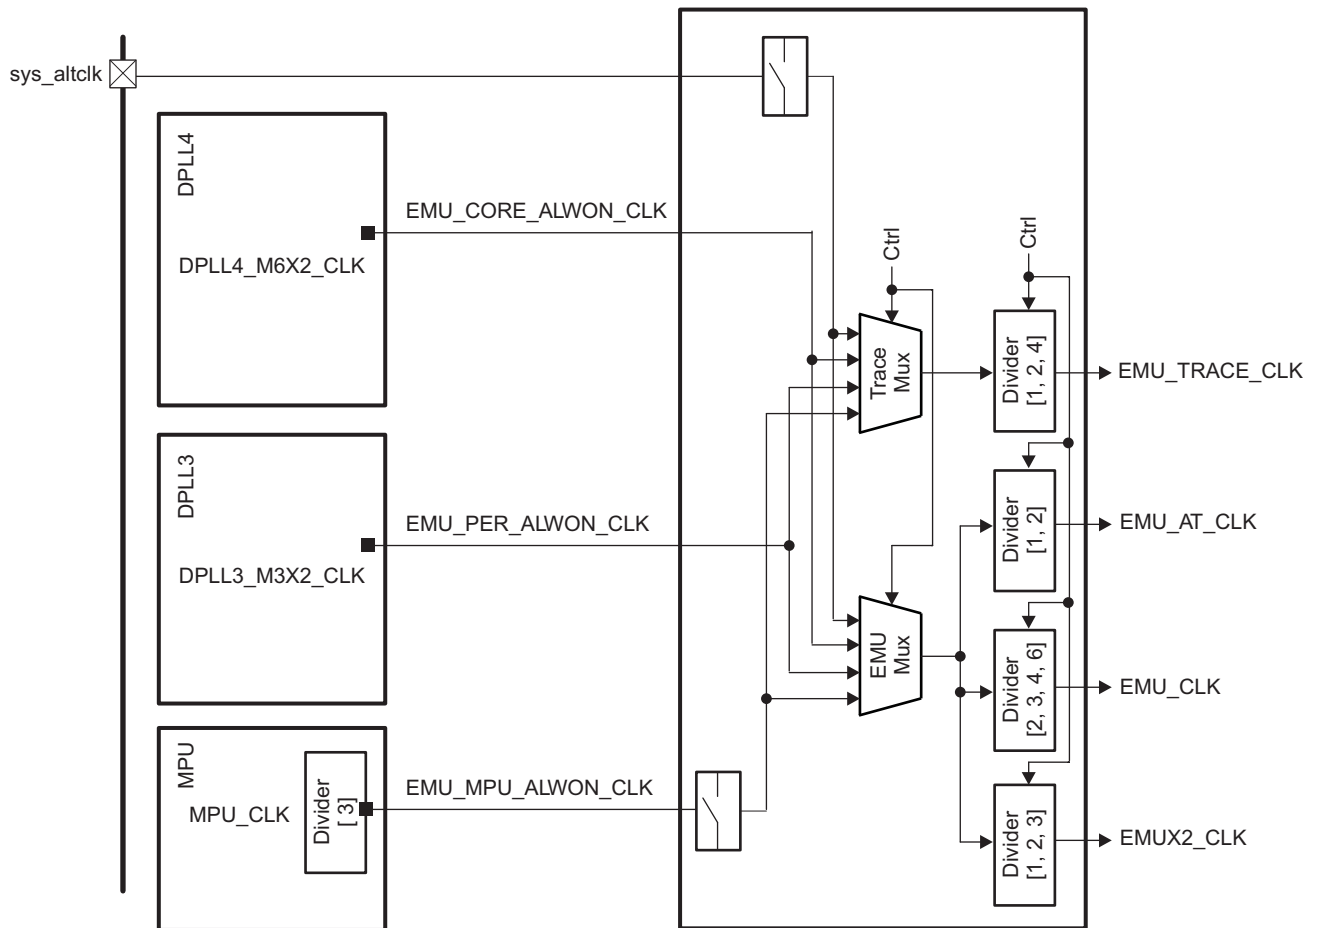

Figure 4-39. CM Clock Generator Functional Overview

prcm-038

Figure 4-40 is the functional overview of the CM for emulation clocks.

Figure 4-40. CM Emulation Clock Generator Functional Overview

prcm-100

### 4.7.3.3 DPLLs

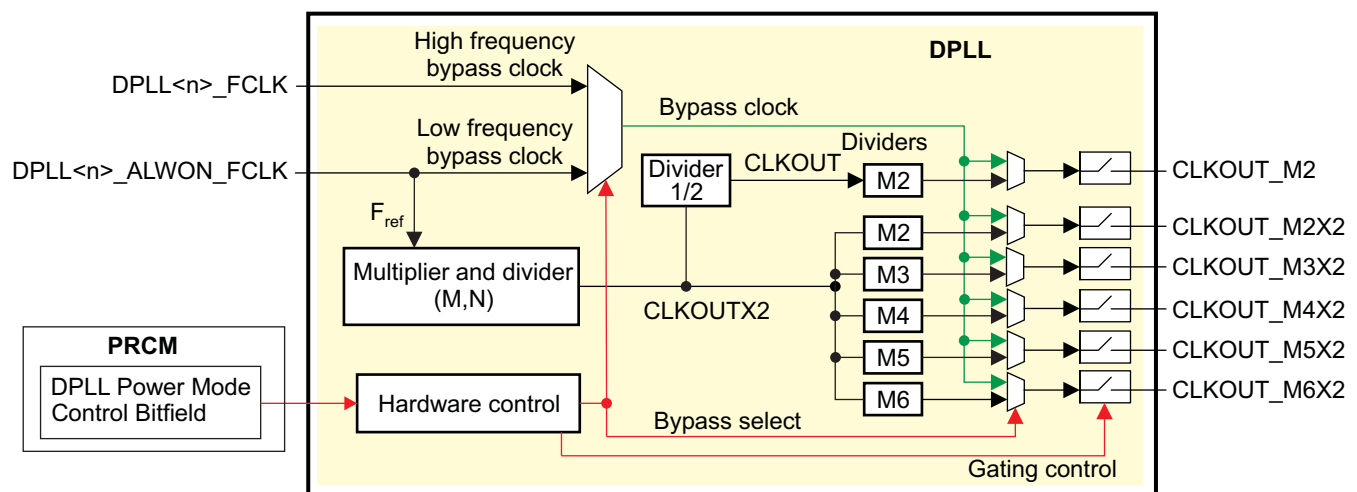

To generate high-frequency clocks, the device supports five on-chip DPLLs controlled directly by the PRCM:

- DPLL1 (MPU)
- DPLL2 (IVA2)
- DPLL3 (CORE)
- DPLL4 (PER)
- DPLL5 (PER2)

**NOTE:** This chapter discusses only DPLL1 to DPLL5, because they are directly controlled by the PRCM module. The *Display Interface Subsystem* chapter discusses the DPLLs in the DSS.

Figure 4-41 shows the functional architecture of a generic DPLL.

**Figure 4-41. Generic DPLL Functional Diagram**

prcm-039

Depending on its hardware configuration, the DPLL may receive one or two clock inputs.

When the DPLL has two clock inputs, it uses one as the reference clock ( $F_{ref}$ ) to generate the high-frequency clock; the second one serves as the bypass clock when the DPLL is in bypass mode (that is, not locked and generating the high-frequency clock). For example, DPLL1 and DPLL2 receive the high-frequency bypass clock from the DPLL3 output, and the reference clock from the PRM.

When the DPLL has only one clock input, it uses that clock input as the reference clock and bypass clock. For example, DPLL3, DPLL4, and DPLL5 receive only one input clock from PRM, and it is used as both the reference and the bypass clock.

It internally generates two main clocks according to the following equations:

- $CLKOUTX2 = (F_{ref} \times 2 \times M) / (N+1)$
- $CLKOUT = CLKOUTX2/2$

where M is an 11-bit multiplier and N is a 7-bit divider.

**NOTE:** When M is set to 0 or 1, the DPLL is forced into bypass mode.

The internal clocks (CLKOUT and CLKOUTX2) of the DPLL may then be used to generate six independent output clocks:

- $CLKOUT\_M2 = CLKOUT / M2$
- $CLKOUT\_M2X2 = CLKOUTX2 / M2$

- $\text{CLKOUT\_M3X2} = \text{CLKOUTX2} / \text{M3}$
- $\text{CLKOUT\_M4X2} = \text{CLKOUTX2} / \text{M4}$
- $\text{CLKOUT\_M5X2} = \text{CLKOUTX2} / \text{M5}$
- $\text{CLKOUT\_M6X2} = \text{CLKOUTX2} / \text{M6}$

where M2, M3, M4, M5, and M6 are additional dividers for the DPLL-synthesized clock.

The output clock frequencies defined by these equations are generated by the DPLL only when it is locked. When the DPLL is in bypass mode, however, all clock outputs run at the bypass clock frequency. The bypass clock can either be a high-frequency bypass clock (only for DPLL1 and DPLL2) or the low-frequency reference clock.

The DPLL also provides an independent clock-gating signal for each of the six output clocks. The PRCM provides the DPLL with a clock-gating control signal, and the DPLL returns a clock activity status signal indicating whether the output clock is effectively gated or running.

For an explanation of the DPLL multiplier, divider settings, and gating controls, see [Section 4.7.6, DPLL Control](#).

Each clock-generating DPLL of the device has the following features:

- Independent power domain
- Control by the CM
- Fed by always-on SYS\_CLK with independent gating control for the SYS\_CLK
- Analog part supplied by a dedicated power supply (VDDPLL and VDDADAC at 1.8 V) and an embedded LDO to eliminate 1-MHz noise
- Up to six independent output dividers for simultaneous generation of multiple output clocks with different frequencies

#### 4.7.3.3.1 DPLL1 (MPU) and DPLL2 (IVA2)

DPLL1 and DPLL2 are in the MPU and IVA2.2 subsystems, respectively. The DPLLs supply the source clocks for their respective subsystems, which use the source clocks to internally generate all subsystem clocks.

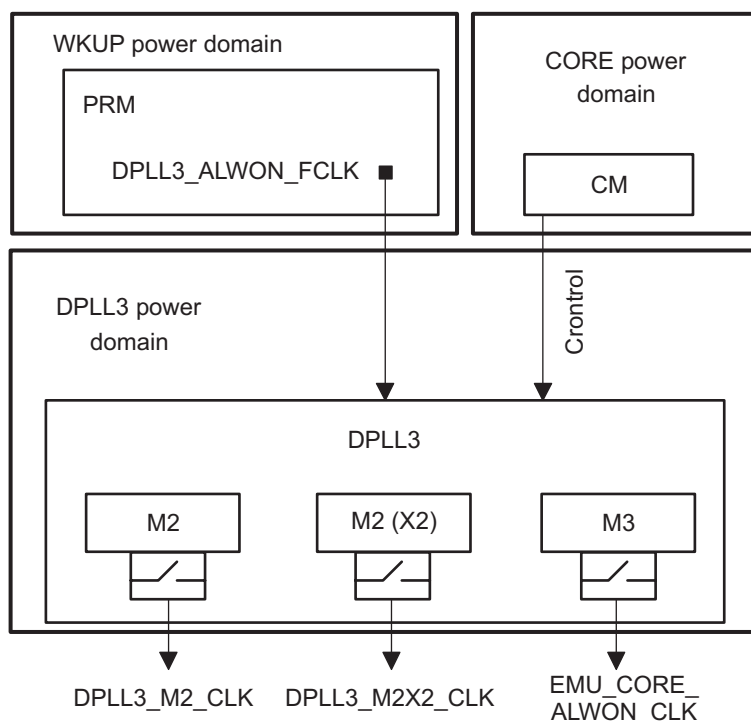

DPLL1 and DPLL2 each use a reference clock to produce their synthesized clocks. They receive these reference clocks (DPLL1\_ALWON\_FCLK and DPLL2\_ALWON\_FCLK, respectively) from the PRM, and their high-frequency bypass clocks (DPLL1\_FCLK and DPLL2\_FCLK, respectively) from the CM. The reference clock is SYS\_CLK, and the high-frequency bypass clock is CORE\_CLK.

To save on DPLL power consumption by the processors, the high-frequency bypass input clock from DPLL3 (CORE) is used when the DPLLs are set to bypass mode (either statically, or dynamically during relock time) or when the processors are not required to run faster than at L3 clock speed. This use of the high-frequency bypass input clock also optimizes the performance of the DPLLs during frequency scaling.

### 4.7.3.3.2 DPLL3 (CORE)

Figure 4-42 is the block diagram of DPLL3.

**Figure 4-42. DPLL3 Clocks**

prcm-040

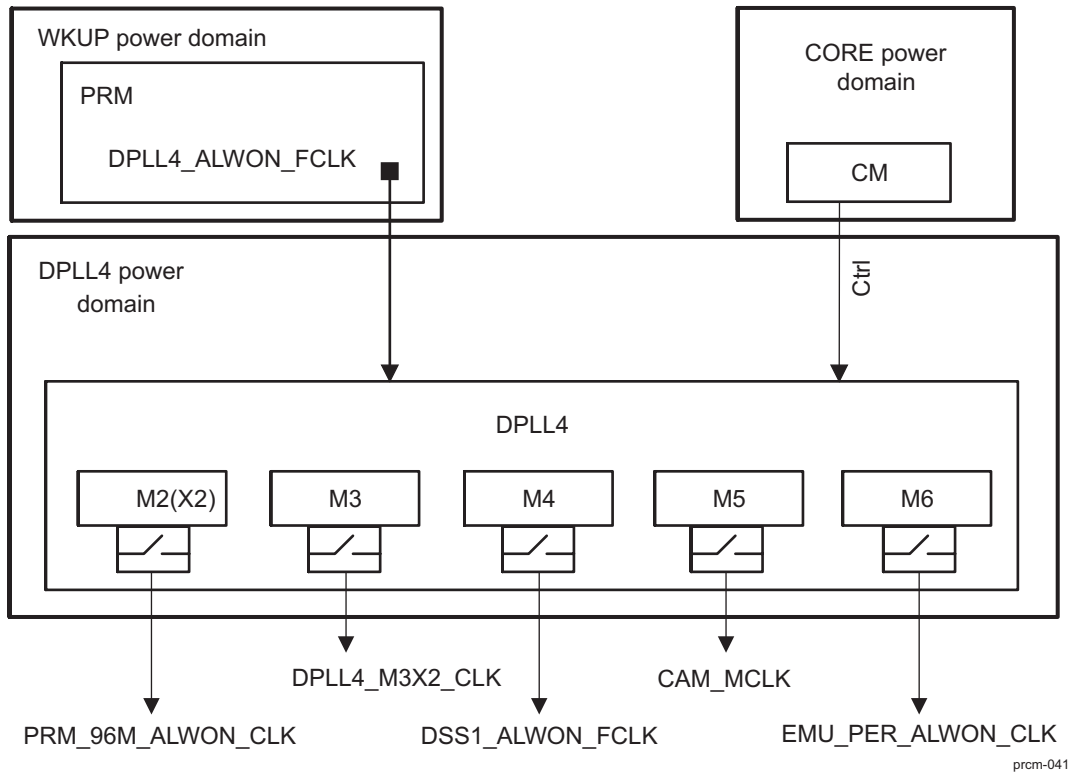

DPLL3 receives its reference clock (DPLL3\_ALWON\_FCLK), which is the SYS\_CLK, from the PRM. DPLL3 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL3 supplies the source clock for all interfaces and a few functional clocks for the device modules. It also serves as the source of the emulation trace clock. While the CORE power domain is on, the output of DPLL3 can be used as HS bypass clock input to DPLL1 and DPLL2.

### 4.7.3.3.3 DPLL4 (Peripherals)

Figure 4-44 is the block diagram of DPLL4.

Figure 4-43. DPLL4 Clocks

DPLL4 receives its reference clock (DPLL4\_ALWON\_FCLK), which is the SYS\_CLK, from the PRM. DPLL4 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL4 generates clocks for the peripherals, supplying five clock sources:

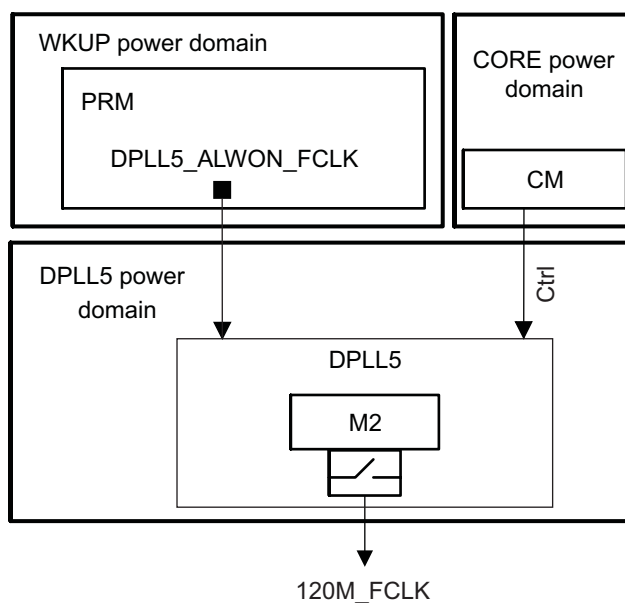

- 96-MHz always-on source clock for the PRM
- 54-MHz to TV DAC
- Display functional clock
- Camera sensor clock
- Emulation trace clock

The clock outputs to the DSS, PER, and EMU power domains are always on.

#### 4.7.3.3.4 DPLL5 (Peripherals)

Figure 4-44 is the block diagram of DPLL5.

**Figure 4-44. DPLL5 Clocks**

DPLL5 receives its reference clock (DPLL5\_ALWON\_FCLK), which is the SYS\_CLK, from the PRM. DPLL5 does not receive a high-frequency bypass clock, and it uses the reference clock as the low-frequency bypass clock. DPLL5 generates clocks for the peripherals, supplying five clock sources:

- 120-MHz functional clock to the peripheral domain modules
- USIM source clock for the functional clock of the USIM open-core protocol (OCP) in the WKUP power domain

#### 4.7.3.3.5 DPLL Clock Summary

Table 4-32 summarizes the use of the divided output clocks of the five DPLLs in the device.

**Table 4-32. DPLL Output Clocks**

	CLKOUT_M2	CLKOUT_M2X2	CLKOUT_M3X2	CLKOUT_M4X2	CLKOUT_M5X2	CLKOUT_M6X2
DPLL1		X <sup>(1)</sup>				
DPLL2	X					
DPLL3	X	X	X			
DPLL4		X	X	X	X	X
DPLL5	X					

<sup>(1)</sup> X represents the DPLL clock output used.

#### 4.7.3.4 32-kHz Oscillator

An internal 32-kHz always-on oscillator feeds the secure watchdog timer (WDTIMER1) and the secure timer (GPTIMER12). It is not software-controllable, and its activity is stopped only when the I/Os (and, consequently, the WKUP power domain) are not supplied. The oscillator ensures protection for these timers against clock stoppage caused by an external attack.

#### 4.7.3.5 Summary

Table 4-33 summarizes the source clocks in the device.

**Table 4-33. Source-Clock Summary**

Clock Name	External/Internal Source	Clock Generator	Description
32K_FCLK	sys_32k (input pin)	PRM	
SYS_CLK	Oscillator	PRM	System clock. Serves as primary source clock of the device. Also used as functional and interface clock for PRM.
DSS_TV_CLK	DPLL4/sys_altclk (input pin)	CM	DSS TV clock
120M_FCLK	DPLL5	CM	
96M_FCLK	DPLL4	CM	
48M_FCLK	DPLL4/sys_altclk (input pin)	CM	
12M_FCLK	DPLL4/sys_altclk (input pin)	CM	
96M_ALWON_CLK		DPLL4	Direct from DPLL4
CORE_CLK	DPLL3	CM	DPLL3 clock output frequency
COREX2_CLK	DPLL3	CM	DPLL3 clock output frequency x 2
L3_ICLK	DPLL3	CM	L3 interconnect interface clock
L4_ICLK	DPLL3	CM	L4 interconnect interface clock
MPU_CLK		DPLL1	MPU subsystem source clock
IVA2_CLK		DPLL2	IVA2.2 subsystem source clock
SECURE_32K_FCLK		32-kHz oscillator	Generated internally by an RC oscillator. It is always active.

## 4.7.4 Clock Distribution

### 4.7.4.1 Power Domain Clock Distribution

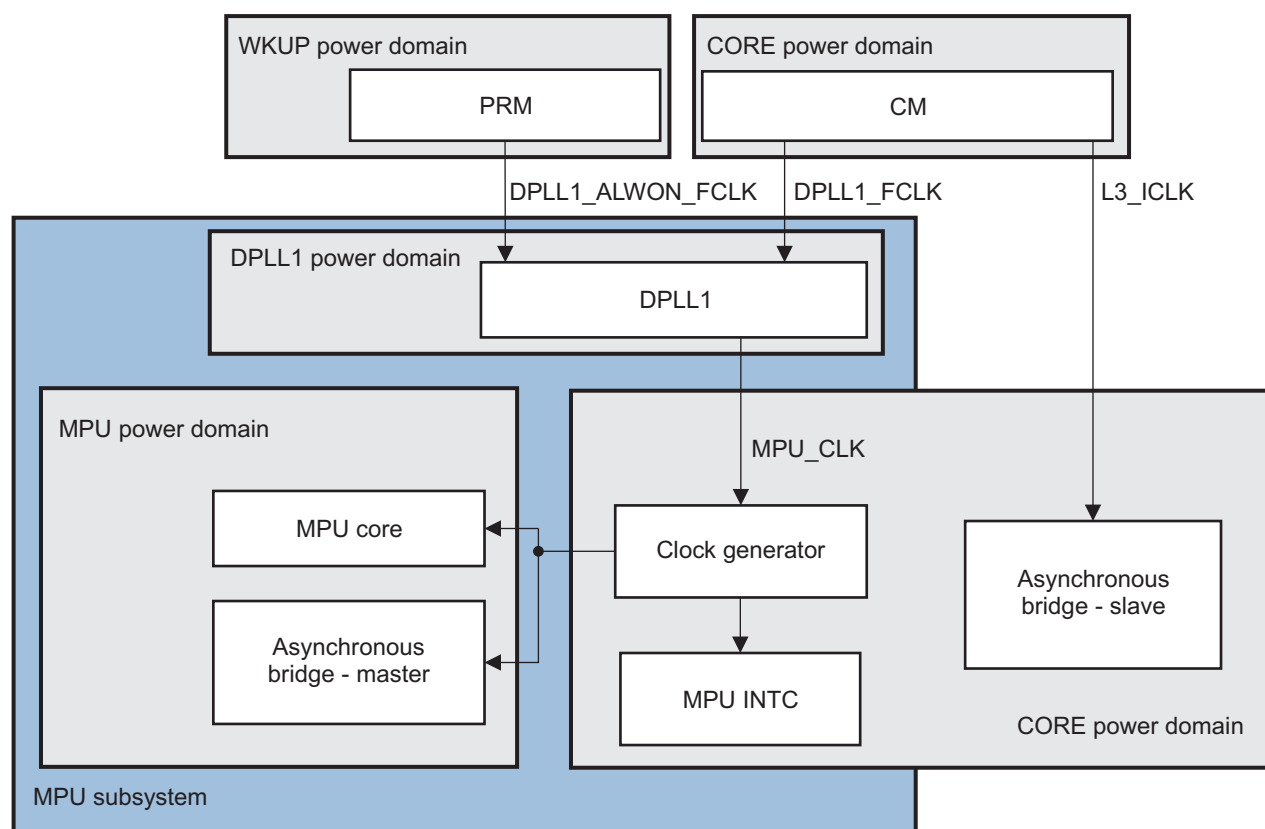

This section describes the PRCM clock distribution over device power domains:

#### 4.7.4.1.1 MPU Power Domain

The PRCM does not directly provide any clock to the MPU power domain. It feeds only DPLL1, which generates MPU\_CLK. All clocks are then locally generated by the clock generator in the MPU subsystem.

Figure 4-45 shows the clocking scheme in the MPU power domain.

**Figure 4-45. MPU Power Domain Clocking Scheme**

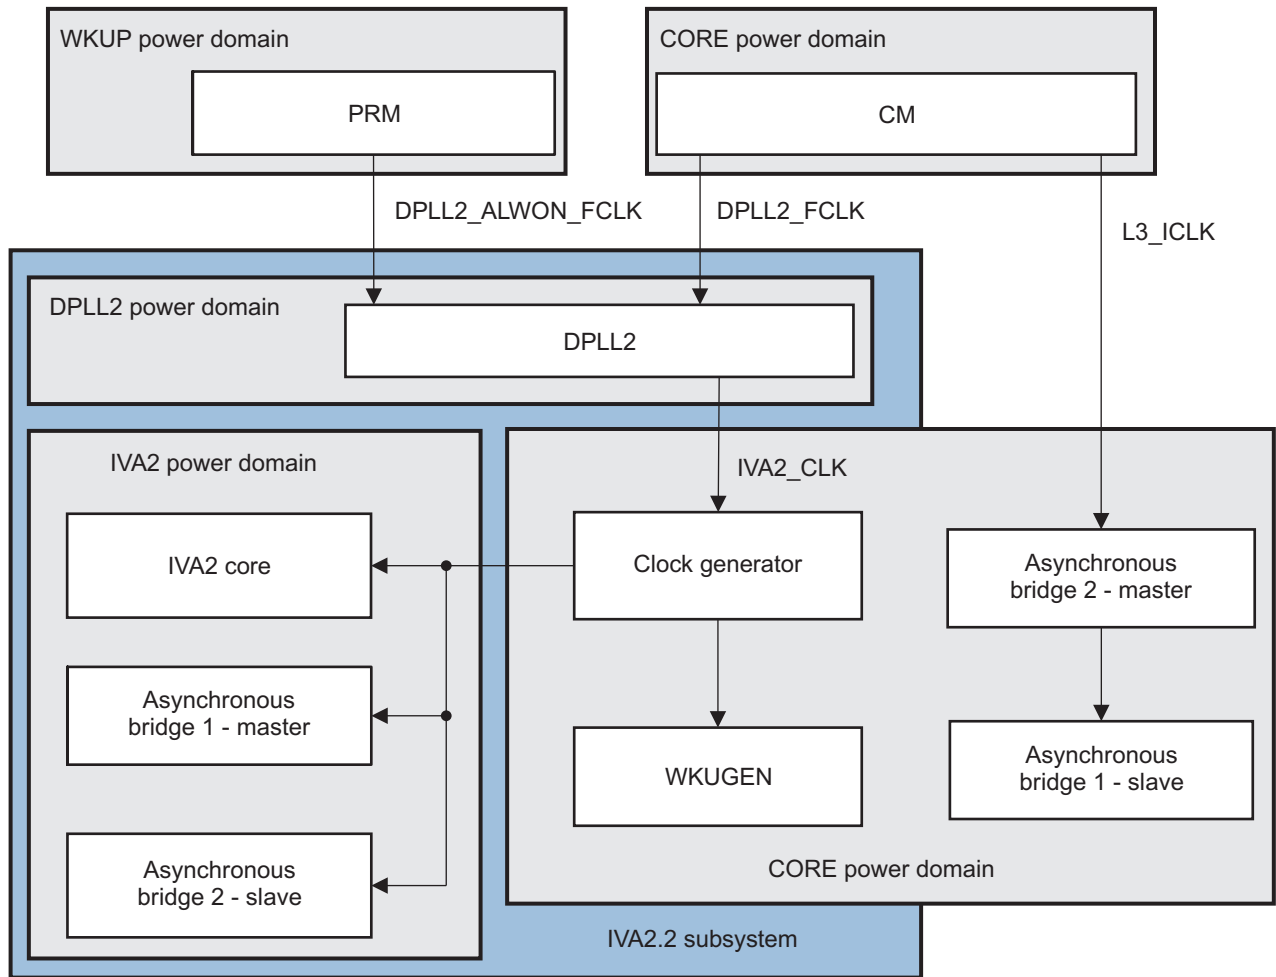

prcm-042

#### 4.7.4.1.2 IVA2 Power Domain

The PRCM does not directly provide any clock to the IVA2 power domain. It feeds only DPLL2, which generates IVA2\_CLK. All clocks are then locally generated by a clock generator in the IVA2.2 subsystem.

Figure 4-46 shows the clocking scheme in the IVA2 power domain.

Figure 4-46. IVA2 Power Domain Clocking Scheme

prcm-043

#### 4.7.4.1.3 SGX Power Domain

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

The SGX subsystem interface clock is sourced by the L3 clock, whereas the functional clock source can be selected between CORE\_CLK and CM\_96M\_FCLK. When the functional clock source is CORE\_CLK, its frequency can be divided (by 3, 4, or 6).

Figure 4-47 shows the clocking scheme in the SGX power domain.

**Figure 4-47. SGX Power Domain Clocking Scheme**

#### 4.7.4.1.4 CORE Power Domain

The CORE power domain has both L3- and L4-derived clock domains.

Refer to [Section 4.8.5.1.1, CORE Power Domain Sleep Transition Constraint](#), for information.

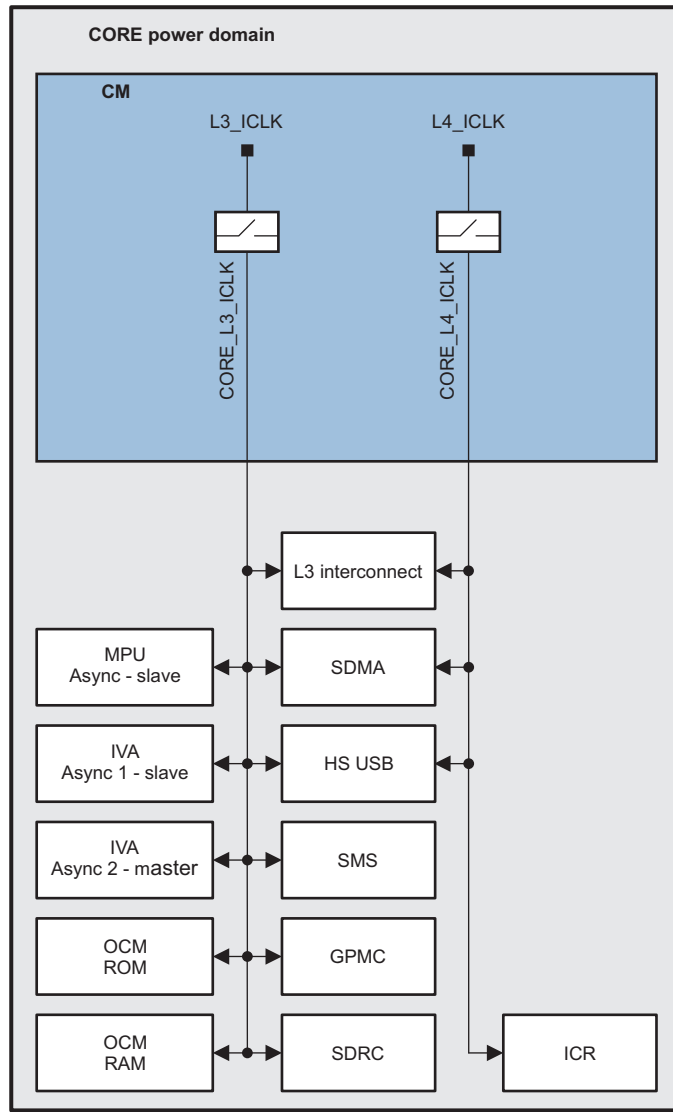

The secure clock domains (SECURITY\_L3\_ICLK, SECURITY\_L4\_ICLK1, and SECURITY\_L4\_ICLK2) allow shutting down all clock domains of the CORE power domain while keeping the secure modules (FPKA1, AES 1, SHAM1, D3D1, and RNG1) clocked and active. This saves power and ensures active security.

The CORE power domain receives several functional clocks (12-, 48-, 96-MHz, system, and 32-kHz) that feed its peripherals and modules, with an exception:

- The McBSP 1 and McBSP 5 modules can be clocked either by CORE\_96M\_FCLK from the CM or from an external clock, MCBSP\_CLKS. The SCM manages the selection between the two sources. For more information about the SCM, see *System Control Module* chapter.

[Figure 4-48](#) through [Figure 4-50](#) show the clock signals and their relationships in the CORE power domain.

Figure 4-48. CORE Clock Signals: Part 1

prcm-045

Figure 4-49. CORE Clock Signals: Part 2

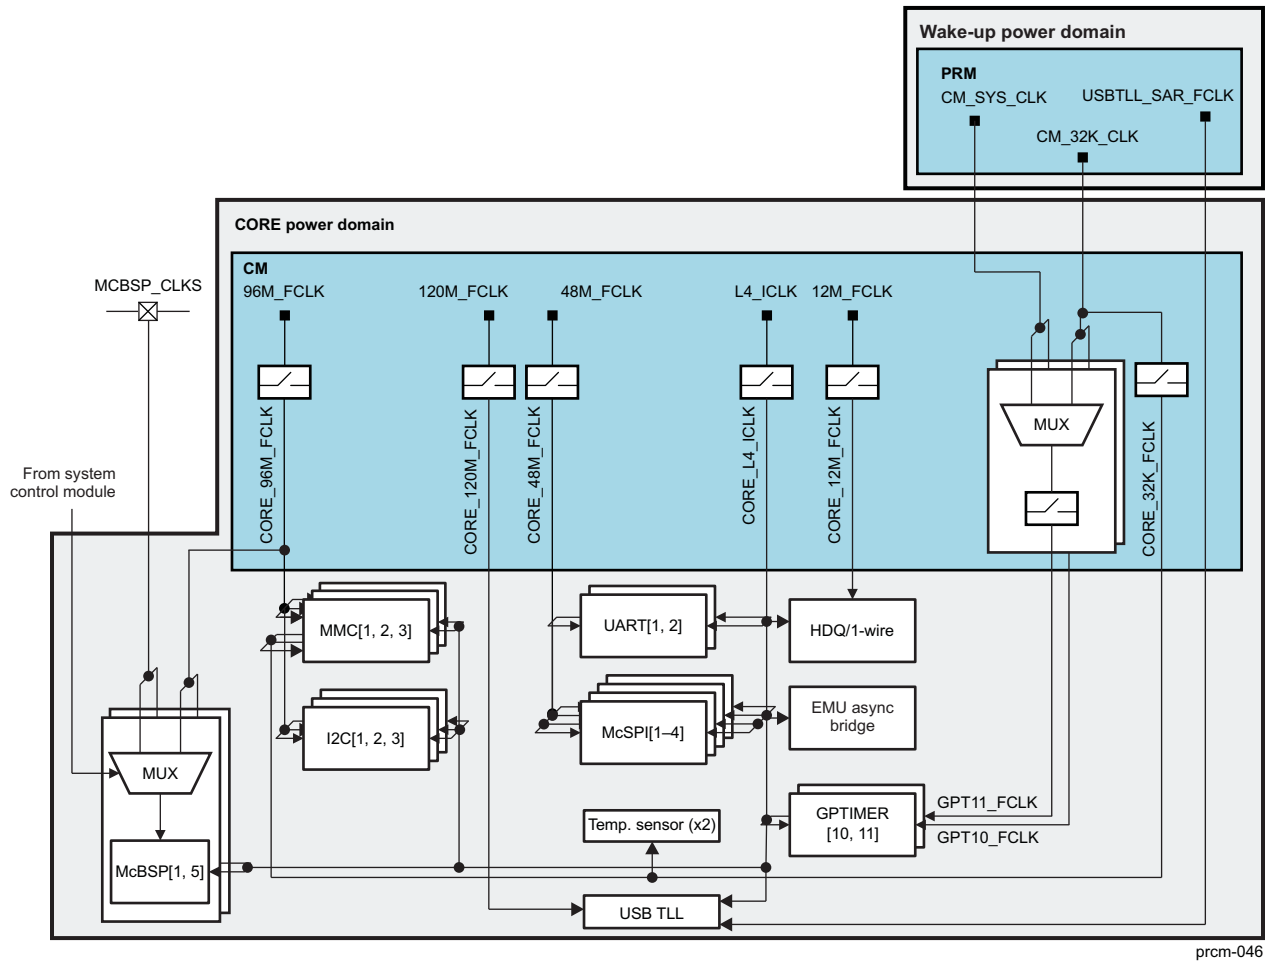

Figure 4-50. CORE Clock Signals: Part 3

prcm-047

#### 4.7.4.1.5 EFUSE Power Domain

Figure 4-51 shows the clock signals and their relationships in the EFUSE power domain.

**Figure 4-51. EFUSE Clock Signals**

prcm-048

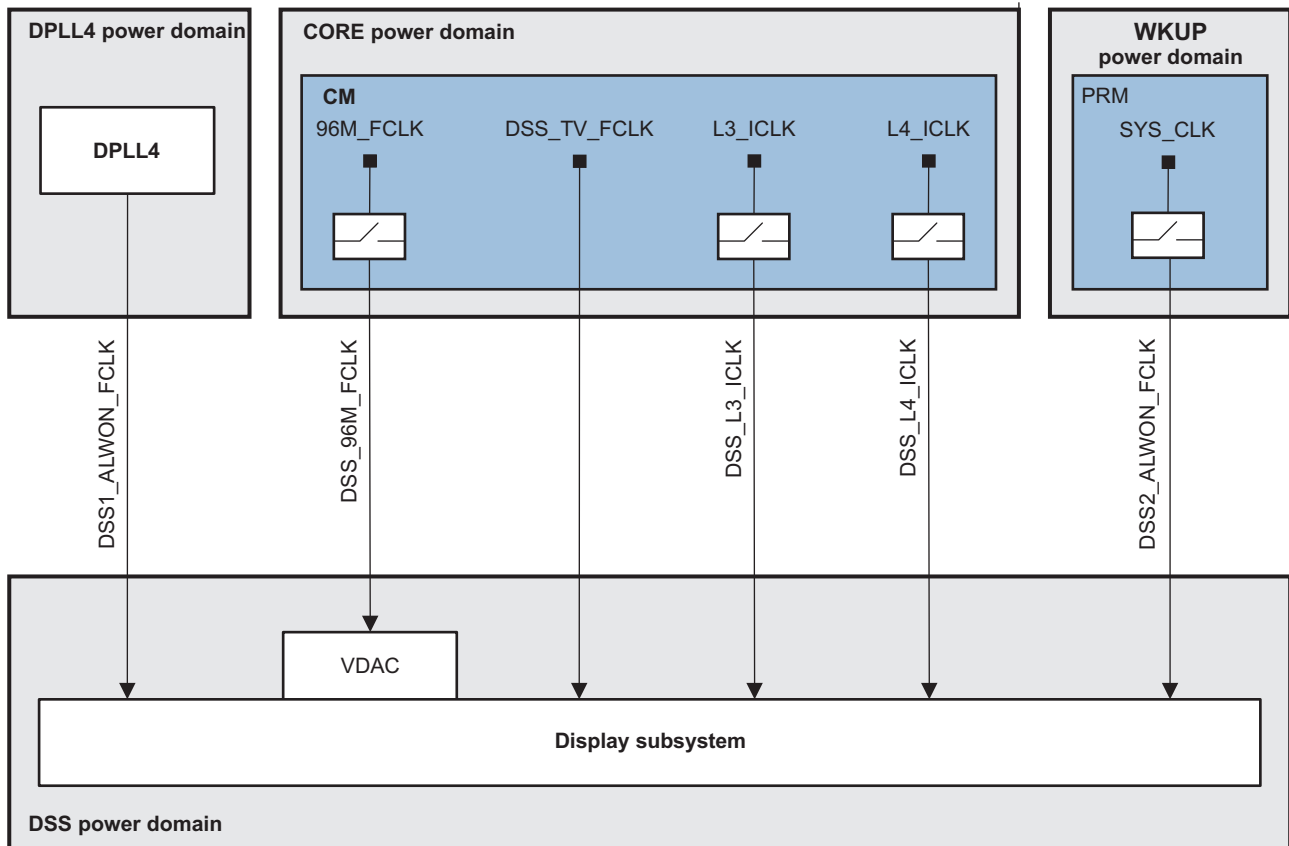

The EFUSE power domain allows the eFuse configuration to be saved even when the CORE power domain is off. The EFUSE sense procedure is performed at device power up and on device wakeup from off mode. During this procedure, the PRM enables the EFUSE\_ALWON\_FCLK clock.

#### 4.7.4.1.6 DSS Power Domain

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-52 shows the clock signals and their relationships in the DSS power domain.

Figure 4-52. DSS Clock Signals

prcm-049

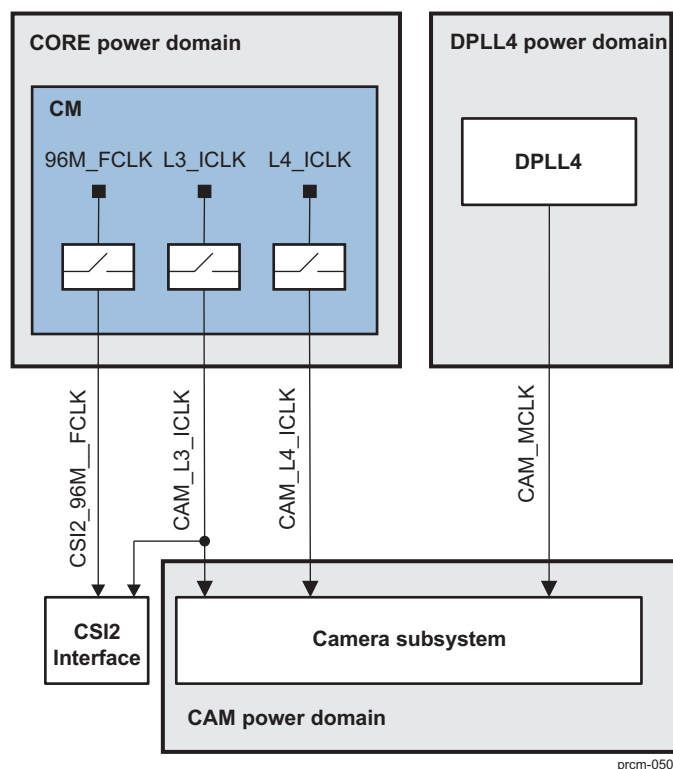

The DSS subsystem interface is clocked with the L3 and L4 clocks. It receives four functional clocks:

- `DSS1_ALWON_FCLK`: Issued from DPLL4. Its frequency can be a division by 1 to 16 of the frequency of the DPLL4 synthesized clock.
- `DSS2_ALWON_FCLK`: The gated `SYS_CLK`. Used mainly for display in low-power refresh modes.
- `DSS_96M_FCLK`: Required when TV output is activated
- `DSS_TV_FCLK`: Required when TV output is activated

#### 4.7.4.1.7 CAM Power Domain

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-53 shows the clock signals and their relationships in the CAM power domain.

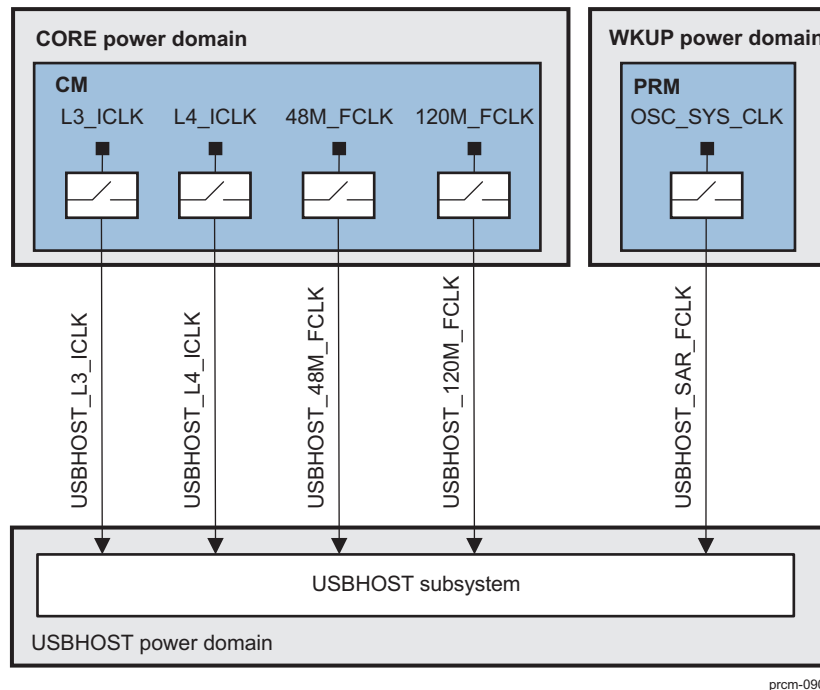

**Figure 4-53. CAM Clock Signals**

The camera subsystem interface is clocked with the L3 and L4 clocks (CAM\_L3\_ICLK and CAM\_L4\_ICLK, respectively). CAM\_L3\_ICLK is also used as the main functional clock. The functional clock (CAM\_MCLK) is also provided by DPLL4 to supply the external sensor.

#### 4.7.4.1.8 USBHOST Power Domain

Figure 4-54 shows the clock signals and their relationships in the USBHOST power domain.

Figure 4-54. USBHOST Clock Signals

The HS USB Host subsystem interface is clocked with the L3 and L4 clocks (USBHOST\_L3\_ICLK and USBHOST\_L4\_ICLK, respectively).

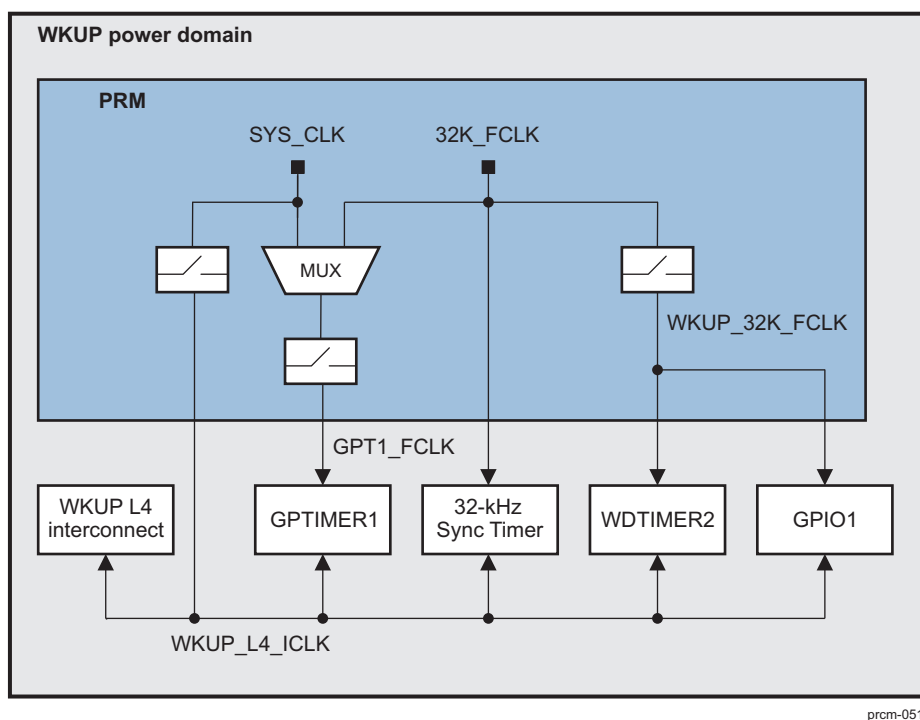

The HS USB Host subsystem requires two functional clocks (USBHOST\_120M\_FCLK and USBHOST\_48M\_FCLK) that may or may not be requested simultaneously. Therefore, they are gated independently based on the configuration of the CM\_FCLKEN\_USBHOST[0] EN\_USBHOST1 and CM\_FCLKEN\_USBHOST[1] EN\_USBHOST2 bits.

The HS USB Host subsystem gets an additional functional clock from the PRM (USBHOST\_SAR\_FCLK). It is dedicated to the save-and-restore mechanism and is automatically gated/enabled by the PRM, based on the HS USB Host save-and-restore bit configuration (that is, the PM\_PWSTCTRL\_USBHOST[4] SAVEANDRESTORE bit) and on the USBHOST power domain state transitions.

#### 4.7.4.1.9 WKUP Power Domain

Figure 4-55 shows the clock signals and their relationships in the WKUP power domain.

**Figure 4-55. WKUP Clock Signals**

All clocks in the WKUP power domain are generated by the PRM, except for the functional clock for the secure timers (WDTIMER1 and GPTIMER12). This clock is supplied directly by the internal 32-kHz oscillator (SECURE\_32K\_FCLK). The functional clock GPT1\_FCLK of GPTIMER1 can be selected as either SYS\_CLK or 32K\_FCLK. The 32-kHz sync timer, WDTIMER2, and GPIO1 receive 32K\_FCLK as their functional clock. This is the low-frequency always-on clock.

The voltage controller module in the PRM receives SYS\_CLK as its functional clock. The SmartReflex I2C4 module implemented in the voltage controller uses the same functional clock (SYS\_CLK).

The PRM receives SYS\_CLK as the L4 interface clock. For all other modules of the WKUP power domain, the L4 interface clock WKUP\_L4\_ICLK is derived from SYS\_CLK. Communication between the WKUP power domain and CORE L4 interconnects is asynchronous.

The USIM OCP module receives the functional clocks (USIM\_FCLK and 32K\_FCLK) and the L4 interface clock (WKUP\_L4\_ICLK) from the PRM.

4.7.4.1.10 PER Power Domain

Figure 4-56 shows the clock signals and their relationships in the PER power domain.

Figure 4-56. PER Clock Signals

prcm-052

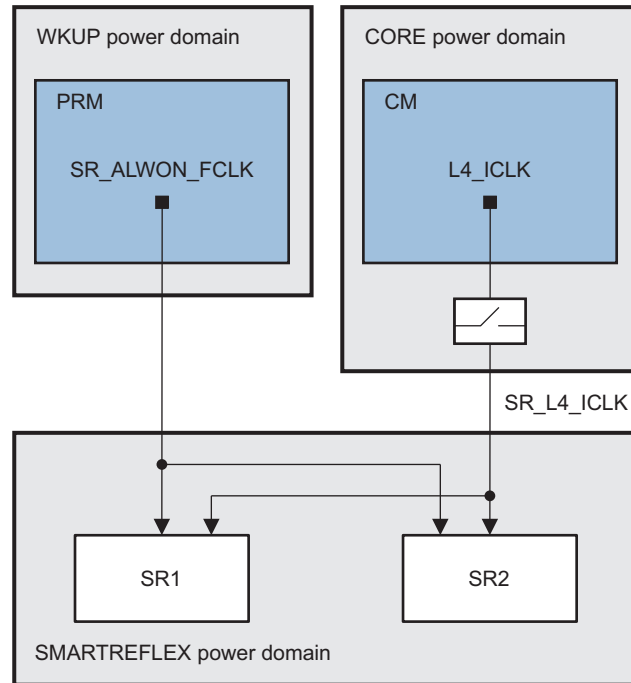

The PER power domain receives several functional clocks (48M\_FCLK, 96M\_ALWON\_FCLK, SYS\_CLK, and 32K\_FCLK) that feed its peripherals and modules. All the functional clocks (except 48M\_FCLK) are permanently supplied so that the peripherals can be used during low-power scenarios, even when the CORE power domain is off. Figure 4-56 shows the clock distribution scheme in the PER power domain.

The McBSP 2, 3, and 4 modules can be clocked either by a clock from PRM (PER\_96M\_FCLK) or from an external clock (MCBSP\_CLKS). This clock must be permanently buffered from the pad to the PER power domain. The device SCM manages the selection between the two (see *System Control Module* chapter).

#### 4.7.4.1.11 SMARTREFLEX Power Domain

The two SmartReflex modules in the device have a common L4 interface clock (SR\_L4\_ICLK) and a functional clock (SR\_ALWON\_FCLK) (see [Figure 4-57](#)).

**Figure 4-57. SMARTREFLEX Clock Signals**

prcm-053

### 4.7.4.1.12 DPLL Domains

The PRCM provides clock sources for the five DPLLs, as shown in [Figure 4-58](#)

**Figure 4-58. DPLL Clock Signals**

The PRCM also manages clock-gating control for these DPLL outputs.

The MPU and IVA2 processors use clock outputs locally in their respective subsystems. The CM uses the DPLL3 clock outputs to generate all interface clocks and some functional clocks. The CM uses two of the five clocks generated by DPLL4 and one clock output of DPLL5 to generate functional clocks for the peripheral domain modules. The remaining three clocks of DPLL4 are propagated to their corresponding modules.

## 4.7.4.2 Clock Distribution Summary

### 4.7.4.2.1 Power Domain Source Clocks

[Table 4-34](#) summarizes clock distribution for each power domain. The clock type indicates whether a clock is supplied when the CM (CORE power domain) is off. "Normal" means that the clock is gated when the power domain is off, while the "always-on" clock remains active even when the CORE power domain is off.

**Table 4-34. Clock Distribution**

Power Domain	Clock	Generator	Type	Destination
MPU	MPU_CLK	DPLL1	Normal	MPU subsystem
NEON				NEON
IVA2	IVA2_CLK	DPLL2	Normal	IVA2.2 subsystem
SGX	SGX_FCLK	CM	Normal	SGX subsystem
	SGX_L3_ICLK	CM	Normal	
CORE	CORE_120M_FCLK	CM	Normal	USB TLL
	CORE_96M_FCLK	CM	Normal	McBSP[1,5], MMC[1,2,3], MS-PRO, I2C[1,2,3]
	CORE_48M_FCLK	CM	Normal	UART[1,2], McSPI[1..4]
	CORE_12M_FCLK	CM	Normal	HDQ
	GPT10_FCLK	CM	Normal	GPTIMER10
	GPT11_FCLK	CM	Normal	GPTIMER11
	CPEFUSE_FCLK	CM	Normal	CPEFUSE
	USBTLL_SAR_FCLK	PRM	Normal	USB TLL
	CM_32K_CLK	PRM	Normal	Temperature sensor (x2), MMC[1,2,3]
	CORE_L3_ICLK	CM	Normal	L3 Interconnect, SDMA, MPU Async Bridge(Slave), IVA2 Async Bridge 1 (Slave), IVA2 Async Bridge 2 (Master), HS USB, SMS, GPMC, OCM ROM, SDRC, OCM RAM, CORE L3 interconnect
	CORE_L4_ICLK	CM	Normal	L3 Interconnect, SDMA, HS USB, AES 2, SHAM2, D3D 2, ICR, McBSP[1,5], MMC[1,2], MS-PRO, I2C[1..3], GPTIMER [10,11], UART[1,2], McSPI[1..4], HDQ, CORE L4 interconnect, MAILBOXES, SCM
	SECURITY_L3_ICLK	CM	Normal	PKA
	SECURITY_L4_ICLK1			
SECURITY_L4_ICLK2	CM	Normal	AES 1, SHAM 1, D3D 1, RNG1	
DSS	DSS_TV_FCLK	CM	Normal	DSS, VDAC
	DSS_96M_FCLK	CM	Normal	VDAC
	DSS1_ALWON_FCLK	DPLL4	Always-on	DSS
	DSS2_ALWON_FCLK	PRM	Always-on	
	DSS_L3_ICLK	CM	Normal	
	DSS_L4_ICLK	CM	Normal	

**Table 4-34. Clock Distribution (continued)**

Power Domain	Clock	Generator	Type	Destination
CAM	CAM_MCLK	DPLL4	Normal	Camera subsystem
	CAM_L3_ICLK	CM	Normal	Camera subsystem, CSI2 interface
	CAM_L4_ICLK	CM	Normal	Camera subsystem
	CSI2_96M_FCLK	CM	Normal	CSI2 interface
PER	96M_ALWON_FCLK	PRM	Always-on	McBSP[2..4]
	PER_48M_FCLK	CM	Normal	UART3
	PER_32K_ALWON_FCLK	CM	Always-on	WDTIMER3, GPIO[2..6],
	GPT2_ALWON_FCLK	PRM	Always-on	GPTIMER2
	GPT3_ALWON_FCLK	PRM	Always-on	GPTIMER3
	GPT4_ALWON_FCLK	PRM	Always-on	GPTIMER4
	GPT5_ALWON_FCLK	PRM	Always-on	GPTIMER5
	GPT6_ALWON_FCLK	PRM	Always-on	GPTIMER6
	GPT7_ALWON_FCLK	PRM	Always-on	GPTIMER7
	GPT8_ALWON_FCLK	PRM	Always-on	GPTIMER8
	GPT9_ALWON_FCLK	PRM	Always-on	GPTIMER9
	PER_L4_ICLK	CM	Normal	UART3, PER L4 interconnect, WDTIMER3, GPIO[2..6], GPTIMER[2..9], McBSP[2..4]
WKUP	WKUP_32K_FCLK	PRM	Always-on	WDTIMER2, GPIO1
	SECURE_32K_FCLK	32-kHz oscillator	Always-on	WDTIMER1, GPTIMER12
	32K_FCLK	PRM	Always-on	32-kHz sync timer, USIM OCP
	GPT1_FCLK	PRM	Always-on	GPTIMER1
	USIM_FCLK	CM	Normal	USIM OCP
	WKUP_L4_ICLK	PRM	Normal	WKUP L4 interconnect, GPTIMER[1,12], 32-kHz sync timer, GPIO1, WDTIMER[1,2], USIM OCP
SMARTREFLEX	SR_ALWON_FCLK	PRM	Always-on	SR1, SR2
	SR_L4_ICLK	CM	Normal	SR1, SR2
EFUSE	EFUSE_ALWON_FCLK	PRM	Always-on	eFuse farm
DPLL1	DPLL1_ALWON_FCLK	PRM	Always-on	DPLL1
	DPLL1_FCLK	CM	Normal	
DPLL2	DPLL2_ALWON_FCLK	PRM	Always-on	DPLL2
	DPLL2_FCLK	CM	Normal	
DPLL3	DPLL3_ALWON_FCLK	PRM	Always-on	DPLL3
DPLL4	DPLL4_ALWON_FCLK	PRM	Always-on	DPLL4
DPLL5	DPLL5_ALWON_FCLK	PRM	Always-on	DPLL5

**NOTE:**

- Modules supplied by the L3 interface clock only:
  - MPU asynchronous bridge
  - IVA2.2 asynchronous bridges
  - All memory controllers (OCM ROM, OCM RAM, SDRC, SMS, and GPMC)
- Modules that require both L3 and L4 clocks:
  - SDMA
  - HS USB
  - All security modules (FPKA, AES, RNG, SHAM, and D3D)
- Modules fed by the L4 clock:
  - SCM
  - Mailboxes
  - ICR
  - All peripherals (McBSP1, McBSP5, MMC1, MMC2, MS-PRO, I2C1, I2C2, I2C3, McSPI1, McSPI2, McSPI3, McSPI4, UART1, UART2, HDQ, GPTIMER10, and GPTIMER11)

#### 4.7.4.2.2 Peripheral Module Clocks

Table 4-35 lists the peripherals, DSS, and CAM functional clock frequency requirements. These frequencies must be operational over the full VDD2 voltage range.

**Table 4-35. Peripheral Module Functional Clock Frequencies**

Module	Functional Clock	Frequency
MS-PRO	96M_FCLK	96 MHz
MMC-SDIO[1,2,3]	96M_FCLK	96 MHz
McBSP[1, 5]	96M_FCLK	96 MHz
CAM	CAM_MCLK	216 MHz
McSPI[1..4]	CORE_48M_FCLK	48 MHz
UART[1..3]		
Display subsystem	DSS1_ALWON_FCLK	Up to 173 MHz
	DSS2_ALWON_FCLK	System clock
	DSS_96M_FCLK	96 MHz
	DSS_TV_FCLK	54 MHz
I2C[1..3]	CORE_96M_FCLK	96 MHz
HDQ	CORE_12M_FCLK	12 MHz
GPTIMER1	GPT1_FCLK	32-kHz (p) or system clock
GPTIMER[2..9]	GPTn_ALWON_FCLK	32-kHz (p) or system clock
GPTIMER[10, 11]	GPTn_FCLK	32-kHz or system clock
GPTIMER12	SECURE_32K_FCLK	32 kHz (p) (s)
FPKA1	SECURITY_L3_ICLK	L3_ICLK
AES 1	SECURITY_L4_ICLK2	L4_ICLK
D3D 1		
SHAM 1		
RNG1		
AES 2		
SHAM 2	CORE_L4_ICLK	L4_ICLK
D3D 2		
ICR		

**Table 4-35. Peripheral Module Functional Clock Frequencies (continued)**

Module	Functional Clock	Frequency
WDTIMER1	SECURE_32K_FCLK	32 kHz (p) (s)
WDTIMER2	WKUP_32K_FCLK	32 kHz
WDTIMER3	PER_32K_ALWON_FCLK	32 kHz
GPIO1	WKUP_32K_FCLK	32 kHz
GPIO[2-6]	PER_32K_ALWON_FCLK	32 kHz
32-kHz sync timer	32K_FCLK	32 kHz (p)
Bandgap/temp sensor	32K_FCLK	32 kHz (p)
System control	CORE_L4_ICLK	L4_ICLK

### 4.7.5 External Clock Controls

Because the use of `sys_32k` and `sys_altclk` was discussed previously (see [Section 4.7.3.1, PRM](#), and [Section 4.7.3.2, CM](#)), these clock signals are not discussed here. This section discusses the remaining external clock signals.

#### 4.7.5.1 Clock Request (`sys_clkreq`) Control

The system clock request signal `sys_clkreq` is bidirectional. In bypass mode in the system clock oscillator (see [Section 4.7.5.2](#)), it is an output signal driven by the device to request an external clock. In this case, the output buffer is driven as long as the system clock is requested by the device; otherwise, it remains in high impedance. In this way, other external peripherals can share the same clock request signal with the device.

If `PRM_POLCTRL.CLKREQ_POL = 1`, the software must configure the SCM to select the internal pulldown on the `sys_clkreq` pad, or an external pulldown is connected to the pad. If

`PRM_POLCTRL.CLKREQ_POL = 0`, the internal pull-up on the `sys_clkreq` pad, or an external pull-up is connected to the pad.

In master mode in the system clock oscillator (see [Section 4.7.5.2](#)), `sys_clkreq` is an input. If `PRM_POLCTRL.CLKREQ_POL = 1`, the software must configure the SCM to select the internal pulldown on the `sys_clkreq` pad, or an external pulldown is connected to the pad. If `PRM_POLCTRL.CLKREQ_POL = 0`, the internal pull-up on the `sys_clkreq` pad, or an external pull-up is connected to the pad.

The `PRM.PRM_POLCTRL[1] CLKREQ_POL` bit allows software control over the polarity of `sys_clkreq`. This software setting takes effect when the clock is requested by the device and also when the clock request is driven externally. The output buffer is directly driven by this register when the clock request comes from OMAP.

[Section 14.5.9.4](#) shows the bidirectional control of the `sys_clkreq` Pad:

**Table 4-36. `sys_clkreq` Pad Direction Control**

					Description
Oscillator Mode	<code>Sys_boot6</code>	Internal Clock request (always active high)	External Clock request (Note: polarity depends on <code>CLKREQ_POL</code> )	<code>Sys_clkreq</code> Direction	
Master Mode	0	0	0 <sup>(1)</sup>	Input (Output buffer in Hi-Z) Note: (Input is not driven from outside of OMAP in that case)	The clock is neither requested internally (by OMAP35x) nor externally (external device/peripheral)
	0	0	1 <sup>(1)</sup>	Input (output buffer in Hi-Z)	The clock is requested externally

<sup>(1)</sup> Case when `PRM_POLCTRL.CLKREQ_POL = 1` (`sys_clkreq` active high). These values would be inverted in the table above, in case `PRM_POLCTRL.CLKREQ_POL = 0` (`sys_clkreq` active low).

**Table 4-36. sys\_clkreq Pad Direction Control (continued)**

					Description
	0	1	0 <sup>(1)</sup>	Output	The clock is requested internally
	0	1	1 <sup>(1)</sup>	Output Note: (the pad is driven both by OMAP and from outside of OMAP in that case)	The clock is requested both internally and externally
Bypass Mode	1	0	0 <sup>(1)</sup>	Input (Output buffer in Hi-Z) Note: (Input is not driven from outside of OMAP in that case)	The clock is neither requested internally nor externally
	1	0	1 <sup>(1)</sup>	Input (output buffer in Hi-Z)	The clock is requested externally
	1	1	0 <sup>(1)</sup>	Output	The clock is requested internally
	1	1	1 <sup>(1)</sup>	Output Note: (the pad is driven both by OMAP and from outside of OMAP in that case)	The clock is requested both internally and externally

#### 4.7.5.2 System Clock Oscillator Control

Depending on the hardware configuration, the device can receive the system clock from an external source or generate it locally using the internal system clock crystal oscillator. Thus, the device oscillator has two possible operating modes:

- Master (oscillator enable) mode: The oscillator is enabled and connected to an external quartz. It provides the system clock to the device. The oscillator is activated on a device wake-up or on an external clock request. It is set to the power-down (OFF) state whenever the device switches to off mode (see [Table 4-38](#)), except when the external system clock request is active on sys\_clkreq pin.
- Bypass (oscillator inactive) mode: The system clock is supplied by an external device and the oscillator is always set in bypass mode. The oscillator is insensitive to the external system clock request on the sys\_clkreq pin.

---

**NOTE:** An external pullup or pulldown tied on the sys\_boot6 input pin of the device determines whether the oscillator is in master or bypass mode. See [Section 4.3.1, External Clock Signals](#).

---

When operating in master mode, the device receives an external clock request (sys\_clkreq) and provides the system clock to external peripherals through the sys\_clkout1 pin; in bypass mode, the device generates a clock request to the external clock source to request the system clock.

The selected mode of the oscillator can be read from the PRCM.PRM\_CLKSRC\_CTRL[1:0] SYSCLKSEL bit field.

Whatever the oscillator mode, the oscillator can be powered down when the device enters inactive, retention or off mode, unless an external system clock request is active (from the sys\_clkreq pin). This setting is configured in the PRCM.PRM\_CLKSRC\_CTRL[4:3] AUTOEXTCLKMODE bit field. [Table 4-38](#) lists the four possible operation modes of the system clock.

**Table 4-37. System Clock Operation Modes**

AUTOEXTCLKMODE	System Clock Mode	Oscillator Mode	Description
0x0	Always-active mode	Master	The oscillator is kept active even when the clock is neither requested by the device internally (all device clocks are inactive) nor externally (that is, the sysclkreq input signal is not asserted).
		Bypass	The sys_clkreq output signal is permanently asserted by the device, regardless of its internal clocks state (active or inactive).

**Table 4-37. System Clock Operation Modes (continued)**

AUTOEXTCLKMODE	System Clock Mode	Oscillator Mode	Description
0x1	Off when device in INACTIVE, RETENTION, or OFF state	Master	The oscillator is switched to off mode when the device is in INACTIVE, RETENTION, or off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is de-asserted when the device is in idle, retention, or off mode.
0x2	Off when device in RETENTION or OFF state	Master	The oscillator is switched to off mode when the device is in retention or off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is de-asserted when the device is in retention or off mode.
0x3	Off when device in OFF state	Master	The oscillator is switched to off mode when the device is in off mode and the sys_clkreq input signal is not asserted.
		Bypass	The sys_clkreq output signal is de-asserted when the device is in off mode.

To exit power-down mode, the oscillator requires a device wakeup or an external clock request.

The device allows configuring of the system clock stabilization time to ensure a stable system clock in the device. This delay is configured in the PRCM.PRM\_CLKSETUP[15:0] SETUP\_TIME bit field.

Figure 4-59 shows the system clock oscillator controls in the device.

**Figure 4-59. System Clock Oscillator Controls**

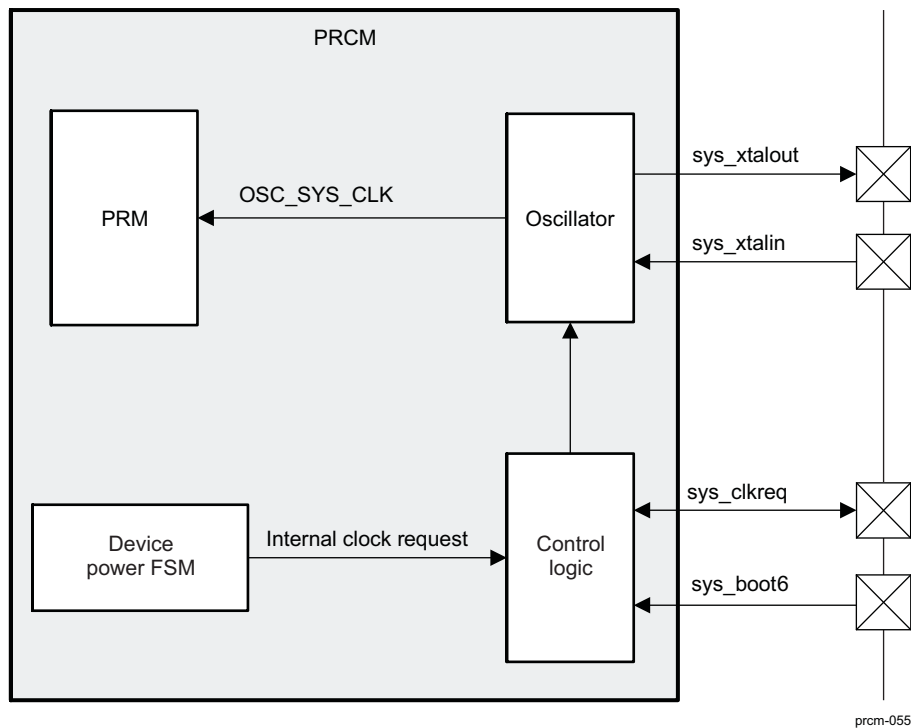

Table 4-38 lists the oscillator controls.

**Table 4-38. Oscillator Controls**

Oscillator Mode	Internal Clock Request <sup>(1)</sup>	External Clock Request <sup>(1)</sup>	Oscillator State	sys_clkreq Pad Direction	sys_clkreq <sup>(1)</sup>	Description
Master	Not asserted	Not asserted	Off	Both input and output	Not asserted	System clock not requested internally (within the device) and externally (by an external device or peripheral).
	Not asserted	Asserted	Active	Input	Asserted	System clock is requested externally only.
	Asserted	Not asserted	Active	Output	Asserted	System clock is requested internally only.
	Asserted	Asserted	Active	Both input and output (that is, driven internally by device and externally by peripheral)	Asserted	System clock is requested internally and externally.
Bypass	Not asserted	x <sup>(2)</sup>	Bypass	Both input and output (when external request is not asserted) or input (when external request is asserted)	External clock request state	System clock is not requested internally (sys_clkreq input has no effect).
	Asserted	x <sup>(2)</sup>	Bypass	Output (when only internal request is asserted) or both input and output (when external and internal request are asserted)	Asserted	System clock is requested internally (sys_clkreq input has no effect).

<sup>(1)</sup>

- If the PRCM.PRM\_POLCTRL[1] CLKREQ\_POL is set to active high (that is, 0x1), Asserted = 1, and Not asserted = 0.
- If the PRCM.PRM\_POLCTRL[1] CLKREQ\_POL is set to active low (that is, 0x0), Asserted = 0, and Not asserted = 1.

<sup>(2)</sup> x indicates that the signal may be asserted or not asserted.

#### 4.7.5.3 External Output Clock1 (sys\_clkout1) Control

The sys\_clkout1 clock is active if the oscillator clock (OSC\_SYS\_CLK) is active (stable) and an external system clock request is active. It can be gated by programming the PRCM.PRM\_CLKOUT\_CTRL[7] CLKOUT\_EN bit. The polarity of the sys\_clkout1 signal, when the clock is gated, is controllable by programming the PRCM.PRM\_POLCTRL[2] CLKOUT\_POL bit.

When the device is in standby mode, both SYS\_CLK and sys\_clkout1 are disabled. In that case, reactivation of sys\_clkout1 depends on the oscillator mode:

- Oscillator in active mode (sys\_boot6 is 0): The sys\_clkout1 clock can be reactivated (after oscillator stabilization), provided its gating was previously enabled by programming the PRCM.PRM\_CLKOUT\_CTRL[7] CLKOUT\_EN bit and asserting an external clock request. This activation does not generate a device wake-up event; an external clock request activates only the internal SYS\_CLK oscillator and sys\_clkout1.
- Oscillator in bypass mode (sys\_boot6 is 1): The sys\_clkout1 clock can be reactivated only after the device wakes up (on any wake-up event) and SYS\_CLK is active. When the device is active, SYS\_CLK is running and sys\_clkout1 is enabled as soon as requested by software.

#### 4.7.5.4 External Output Clock2 (sys\_clkout2) Control

A second output clock, sys\_clkout2, is generated with a frequency that can be the source-clock frequency divided by 1, 2, 4, 8, or 16. Its source clock can be CORE\_CLK, CM\_SYS\_CLK, 96 MHz, or 54 MHz. Unlike sys\_clkout1, this second external clock is not active when the device is in off power mode. Also, the selected source clock must be enabled by software. Enabling sys\_clkout2 does not automatically request the required source clock. The polarity of the sys\_clkout2 signal, when the clock is gated, is controllable by programming the PRCM.CM\_POLCTRL[0] CLKOUT2\_POL bit.

## 4.7.6 DPLL Control

The PRCM allows the configuration of the output clock frequencies of the DPLLs by setting their respective multipliers and dividers. It also allows control of the operating mode of the DPLLs and automatic recalibration mode.

### 4.7.6.1 DPLL Multiplier and Divider Factors

DPLL clock outputs are set by programming the corresponding multiplier and divider factors M, N, M2, M3, M4, M5, and M6. [Table 4-39](#) lists the register bit fields for configuration of the multiplier and divider factors for the DPLLs.

**Table 4-39. DPLL Multiplier and Divider Factors**

	DPLL1	DPLL2	DPLL3	DPLL4	DPLL5
M	PRCM.CM_CLKSEL1_PLL_MPU[18:8] MPU_DPLL_MULT	PRCM.CM_CLKSEL1_PLL_IVA2[18:8] IVA2_DPLL_MULT	PRCM.CM_CLKSEL1_PLL[26:16] CORE_DPLL_MULT	PRCM.CM_CLKSEL2_PLL[18:8] PERIPH_DPLL_MULT	PRCM.CM_CLKSEL4_PLL[18:8] PERIPH2_DPLL_MULT
N	PRCM.CM_CLKSEL1_PLL_MPU[6:0] MPU_DPLL_DIV	PRCM.CM_CLKSEL1_PLL_IVA2[6:0] IVA2_DPLL_DIV	PRCM.CM_CLKSEL1_PLL[14:8] CORE_DPLL_DIV	PRCM.CM_CLKSEL2_PLL[6:0] PERIPH_DPLL_DIV	PRCM.CM_CLKSEL4_PLL[6:0] PERIPH2_DPLL_DIV
M2	PRCM.CM_CLKSEL2_PLL_MPU[4:0] MPU_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL2_PLL_IVA2[4:0] IVA2_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL1_PLL[31:27] CORE_DPLL_CLKOUT_DIV	PRCM.CM_CLKSEL3_PLL[4:0] DIV_96M	PRCM.CM_CLKSEL5_PLL[4:0] DIV_120M
M3	Not used	Not used	PRCM.CM_CLKSEL1_EMU[20:16] DIV_DPLL3	PRCM.CM_CLKSEL_DSS[12:8] CLKSEL_TV	Not used
M4	Not used	Not used	Not used	PRCM.CM_CLKSEL_DSS[4:0] CLKSEL_DSS1	Not used
M5	Not used	Not used	Not used	PRCM.CM_CLKSEL_CAM[4:0] CLKSEL_CAM	Not used
M6	Not used	Not used	Not used	PRCM.CM_CLKSEL1_EMU[28:24] DIV_DPLL4	Not used

### 4.7.6.2 DPLL Jitter Correction

To satisfy the jitter specification of the DPLL at a specific internal clock frequency, set the corresponding CM\_CLKEN\_PLL\_processor\_name>[7:4]processor\_name>\_DPLL\_FREQSEL, CM\_CLKEN\_PLL[23:20] PERIPH\_DPLL\_FREQSEL, CM\_CLKEN\_PLL[7:4] CORE\_DPLL\_FREQSEL, CM\_CLKEN2\_PLL[7:4] PERIPH2\_DPLL\_FREQSEL bit field. [Table 4-40](#) lists the possible values for the bit field and the corresponding internal clock frequency ranges.

**NOTE:** The internal clock frequency is the frequency of the internal interface clock Fint, with  $F_{int} = \text{CLKINP}/(N + 1)$ .

**Table 4-40. Internal Clock Frequency**

Bit Field Values	Clock Frequency Ranges
0x3	0.75 MHz—1.0 MHz
0x4	1.0 MHz—1.25 MHz
0x5	1.25 MHz—1.5 MHz
0x6	1.5 MHz—1.75 MHz
0x7	1.75 MHz—2.1 MHz
0xB	7.5 MHz—10 MHz
0xC	10 MHz—12.5 MHz
0xD	12.5 MHz—15 MHz
0xE	15 MHz—17.5 MHz
0xF	17.5 MHz—21 MHz
Other cases are reserved.	

---

**NOTE:** In the DPLL programming sequence, the DPLL\_FREQSEL must be programmed before the new Multiplier factor M and the Divider factor N are programmed so that the new value is taken into account during current DPLL relock.

---

#### 4.7.6.3 DPLL Frequency Ramp-Up Delay

When the DPLL switches from bypass mode to lock mode, the clock output frequency changes from bypass clock frequency to normal operating frequency. The frequency ramp-up feature allows the DPLL output frequency to switch gradually (in steps) from the bypass to locked frequency. Before reaching the locked frequency, the DPLL output switches to four intermediate frequencies:

1.  $F_{out}/8$
2.  $F_{out}/4$
3.  $F_{out}/2$
4.  $F_{out}$

The time delay in passing from the bypass clock frequency to normal frequency is the ramp-up delay. The ramp-up delay is configured by setting the `CM_CLKEN_PLL_processor_name>[9:8]processor_name>_DPLL_RAMPTIME`, `CM_CLKEN_PLL[25:24]PERIPH_DPLL_RAMPTIME`, `CM_CLKEN_PLL[9:8]CORE_DPLL_RAMPTIME`, `CM_CLKEN2_PLL[9:8]PERIPH2_DPLL_RAMPTIME` bit field.

There are three possible values for the bit field and the corresponding ramp-up delays:

- 0x0: Disables the frequency ramping feature.
- 0x1: Ramp step size range is 2–40  $F_{int}$  cycles.
- 0x2: Ramp step size range is 4–80  $F_{int}$  cycles.
- 0x3: Ramp step size range is 12–240  $F_{int}$  cycles.

---

**NOTE:** If the ramp-up time configured for the DPLL is less than the DPLL lock time, the last frequency step,  $F_{out}/2$  to  $F_{out}$ , gets stretched to the DPLL lock time.

---

#### 4.7.6.4 DPLL Modes

DPLL supports several power modes (see [Table 4-41](#)). Each mode results in a tradeoff between power savings and relock time.

**Table 4-41. DPLL Power Modes**

Mode	Clock Input	Clock Output	DPLL Power State	Power Consumption	Latency
Locked	On	Lock frequency	ON	Maximum	N/A
Low-power bypass	On	Bypass frequency	ON	Less than locked	Same as low-power stop
Fast-relock bypass	On	Bypass frequency	ON	Less than locked	Less than low-power bypass
Low-power stop	On	Bypass frequency	ON	Less than locked	Same as low-power bypass
MN bypass	On	Bypass frequency	ON	Less than locked	Maximum
Off	Off	Off	OFF	Minimum	Maximum

A DPLL power mode can be achieved on a software request (manual) and/or automatically (automatic), depending on the specific hardware conditions. After a device power-on reset, the DPLL can be kept in either low-power stop mode (DPLL2, DPLL4 and DPLL5) or MN bypass mode (DPLL1 and DPLL3).

A DPLL can switch from one mode to the other as a result of the following:

- Software-programmed transition only (manual): The software configures a dedicated register for the next desired DPLL mode. It must ensure that the transition can be performed based on the activity on the device.
- Combined software-programmed and hardware-conditions-based transition (automatic): The PRCM triggers the transition when the software requests it (by configuring the registers) and the hardware conditions are satisfied. When the hardware conditions are no longer met, the PRCM triggers the return transition.

For automatic transition, automatic mode must be enabled by programming the PRCM.CM\_AUTOIDLE\_PLL or the PRCM.CM\_AUTOIDLE\_PLLprocessor\_name> registers.

Table 4-42 describes the manual and automatic control of the DPLL power modes by the PRCM.

**Table 4-42. DPLL Power Modes Support**

Mode	DPLL1	DPLL2	DPLL3	DPLL4	DPLL5
Locked	Software request (manual) or MPU wakes up (automatic).	Software request (manual) or IVA2.2 wakes up (automatic).	Software request (manual) or CORE wakes up (automatic).	Software request (manual) or at least one peripheral clock is used (automatic).	Software request (manual) or at least one peripheral clock is used (automatic).
Low-power bypass	Software request (manual)	Software request (manual)	Software request (manual) or all interface clocks are gated (automatic).	N/A	N/A
Fast-relock bypass	N/A	N/A	Software request (manual).	N/A	N/A
Low-power stop	MPU is idle (automatic).	Software request (manual) or IVA2.2 is idle (automatic) or on global reset release (automatic).	Device is idle (automatic).	(Default state) Software request (manual) or all functional clocks from DPLL are unused or on global reset release (automatic).	(Default state) Software request (manual) or all functional clocks from DPLL (120-MHz clock) are unused or on global reset release (automatic).
MN bypass	Global reset (automatic)	N/A	Global reset (automatic).	N/A	N/A
Off	Device off (automatic)	Device off (automatic)	Device off (automatic).	Device off (automatic)	Device off (automatic)

**NOTE:** DPLL1 and DPLL3 cannot be manually forced to switch to Low-Power Stop mode from any other power mode. They must be in Locked state with automatic transition to Low-Power Stop mode configured and the hardware condition for the transition (identified in Table 4-42) must be satisfied, in order to switch to the Low-Power Stop mode.

Table 4-43 lists the bit fields that must be programmed for manual and automatic mode control of the five DPLLs.

**Table 4-43. DPLL Power Mode Control**

Mode	Manual Control	Auto Control
DPLL1	PRCM.CM_CLKEN_PLL_MPU[2:0] EN_MPU_DPLL	PRCM.CM_AUTOIDLE_PLL_MPU[2:0] AUTO_MPU_DPLL
DPLL2	PRCM.CM_CLKEN_PLL_IVA2[2:0] EN_IVA2_DPLL	PRCM.CM_AUTOIDLE_PLL_IVA2[2:0] AUTO_IVA2_DPLL
DPLL3	PRCM.CM_CLKEN_PLL[2:0] EN_CORE_DPLL	PRCM.CM_AUTOIDLE_PLL[2:0] AUTO_CORE_DPLL
DPLL4	PRCM.CM_CLKEN_PLL[18:16] EN_PERIPH_DPLL	PRCM.CM_AUTOIDLE_PLL[5:3] AUTO_PERIPH_DPLL
DPLL5	PRCM.CM_CLKEN2_PLL[2:0] EN_PERIPH2_DPLL	PRCM.CM_AUTOIDLE2_PLL[2:0] AUTO_PERIPH2_DPLL

---

**NOTE:** The DPLL automatically enters locked mode on a power domain wakeup only if the DPLL is locked before the sleep transition and one of the automatic modes is enabled.

---

#### 4.7.6.5 DPLL Low-Power Mode

The DPLL can operate in a low-power mode by reducing the operating frequency range. This in turn reduces the power consumption of the DPLL. In this mode, however, there is a period and phase jitter effect.

The DPLL can enter this mode only if the targeted lock frequency of the DPLL is less than 600 MHz. This implies locking or relocking the DPLL to a new targeted locked-frequency when entering or exiting low-power mode. Software must ensure that the DPLL lock-frequency does not exceed 600 MHz in low-power mode.

Software can enable/disable automatic switching of the DPLL between normal mode and low-power mode. The new mode is effective only after the DPLL is relocked. Low-power mode control is considered only during the following transitions:

- From bypass mode to lock
- From stop mode to lock
- From lock to relock

Table 4-44 lists the bit fields that must be programmed for manual control of the five DPLLs.

**Table 4-44. LP Mode Control**

Mode	Manual Control
DPLL1	PRCM.CM_CLKEN_PLL_MPU[10] EN_MPU_DPLL_LPMODE
DPLL2	PRCM.CM_CLKEN_PLL_IVA2[10] EN_IVA2_DPLL_LPMODE
DPLL3	PRCM.CM_CLKEN_PLL[10] EN_CORE_DPLL_LPMODE
DPLL4	PRCM.CM_CLKEN_PLL[26] EN_PERIPH_DPLL_LPMODE
DPLL5	PRCM.CM_CLKEN2_PLL[10] EN_PERIPH2_DPLL_LPMODE

#### 4.7.6.6 DPLL Clock Path Power Down

DPLL3 and DPLL4 can power down the CLKOUTX2 path. A small section of logic is powered down as the M2 post divider is also shared with the CLKOUT path, which remains functional.

The HSDIVIDER can power down each CLKOUTn path (with n in the range of 3 to 6) independently, therefore allowing further power savings. The clock output path is also powered down when the DPLL is in stop mode, regardless of the software setting.

Software must ensure the proper sequencing of the control. To avoid a glitch at the output, activate this control when the clock is no longer required, and when the output clock is gated. Conversely, ensure a delay between deactivation and reactivation of the clock by using the power-down control.

Table 4-45 lists the bit fields and the corresponding clock outputs of the DPLLs.

**Table 4-45. Clock Path Power-Down Control**

DPLL	Control Bit Field	Clock Path
DPLL4	PRCM.CM_CLKEN_PLL[27] PWRDN_96M	96-MHz clock output (DPLL4 output M2X2)
	PRCM.CM_CLKEN_PLL[28] PWRDN_TV	DSS TV clock output (DPLL4 output M3X2)
	PRCM.CM_CLKEN_PLL[29] PWRDN_DSS1	DSS1 clock output (DPLL4 output M4X2)
	PRCM.CM_CLKEN_PLL[30] PWRDN_CAM	CAM clock output (DPLL4 output M5X2)
	PRCM.CM_CLKEN_PLL[31] PWRDN_EMU_PERIPH	EMU_PERIPH clock output (DPLL4 output M6X2)
DPLL3	PRCM.CM_CLKEN_PLL[12] PWRDN_EMU_CORE	EMU_CORE clock output (DPLL3 output M3X2)

#### 4.7.6.7 Latencies

Lock mode for the DPLL is frequency lock.

Lock latencies depend on the internal reference frequency ( $F_{INT}$ ) of the DPLL, calculated as:

$$F_{INT} = F_{ref} / (N+1)$$

where  $F_{ref}$  is the reference clock input to DPLL.

Table 4-46 lists the operating modes of the DPLL and the output clock frequency and associated lock latency.

FREQSEL[3] = 0 refers to the following bits:

- CM\_CLKEN\_PLL\_IVA2[7]
- CM\_CLKEN\_PLL\_MPU[7]
- CM\_CLKEN\_PLL[7]
- CM\_CLKEN\_PLL[23]
- CM\_CLKEN2\_PLL[7]

**Table 4-46. DPLL Operating Mode and Latency**

Mode	CLKOUTX2	Lock Time in FINT cycles (FREQSEL[3] = 0)	Lock Time in Fint Cycles (FREQSEL[3]= 1)
OFF	Off	150	780
M, N reprogramming	bypass clock	150	780
Low-power stop mode	Off	40	400
Low-power bypass	bypass clock	40	400
Fast-relock bypass	bypass clock	10	100
Active (locked)	CLKINP x M/(N+1)/M2 x 2	N/A	N/A

The post-divider M2 supports change on the fly. The time required to switch from the clock with the old period to the clock with the new period depends on the old value of M2 (see Table 4-47).

**Table 4-47. Time Required to Switch Clocks**

Old Value of M2	Time for Switching
1	4 REFCLKs + 8 CLKOUTX2s
Even	4 REFCLKs + 2 CLKOUTX2s
Odd & > 1	4 REFCLKs + 4 CLKOUTX2s

#### 4.7.6.8 Recalibration

A lock sequence occurs during an initial lock or during a relock following a new multiplier or divider value. Each time the DPLL is reset or performs a lock sequence, it performs a recalibration of the output frequency, based on the voltage and temperature conditions. By compensating for voltage and temperature changes within a certain range, the calibration allows the lock frequency to remain steady. If the voltage or temperature drifts outside the acceptable range, the DPLL asserts a recalibration flag.

For example, a large temperature drift can cause the DPLL to lose its lock and require recalibration. When the DPLL locks at a temperature within the 080 degrees Celsius range, the maximum temperature drift is approximately 55 degrees Celsius. When DPLL starts at a negative temperature, the maximum temperature drift is higher.

If the DPLL locks at 30 degrees Celsius, the temperature can change by 60 degrees Celsius (from 30 to +90 degrees Celsius) and the DPLL will not lose the lock. However, for temperatures above the 60 degrees Celsius range, the DPLL may need to be relocked. A new relock sequence reinitializes the starting temperature.

This compensation mechanism is active only while the DPLL is locked. When the DPLL is in off or bypass mode (low-power or fast-relock), it does not assert the recalibration flag. If the voltage or temperature exceeds the drift limits while the DPLL is not locked, and then the DPLL tries to relock, the DPLL fails to lock within the normal delay and recalibrates automatically before eventually locking. The only difference from a standard relock is the delay.

The DPLL can automatically start recalibration when the recalibration flag is asserted, or recalibration can be managed by the software. The mode of operation is selected by configuring the corresponding registers in the PRCM (see [Table 4-48](#)). The software or manual control mode is selected by default.

---

**NOTE:** Automatic recalibration of the DPLL can start at any time. While relocking, the DPLL switches to bypass mode. For modules that are sensitive to frequency change while operating, this can introduce operational instability. For example, the SDRC is sensitive to a frequency change on DPLL3 because its embedded DLL relocks on a frequency change. Any access during this DLL relock period can be corrupted. It is important, therefore, to stall SDRC access during DPLL recalibration.

---

To allow the software to recalibrate the DPLL at the correct time depending on the device activity, the PRCM can generate a wake-up event on the MPU power domain, followed by an interrupt on the MPU when the DPLL recalibration flag is asserted.

[Table 4-48](#) summarizes the software programming control over the DPLL recalibration feature.

**Table 4-48. DPLL Recalibration Controls**

DPLL	Software Control	Description
DPLL1 (MPU)	PRCM.CM_CLKEN_PLL_MPU[3] MPU_DPLL_DRIFTGUARD	Enable/disable the MPU DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[7] MPU_DPLL_RECAL_EN	Enable/disable the MPU DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[7] MPU_DPLL_ST	Status of the MPU DPLL recalibration interrupt
DPLL2 (IVA2)	PRCM.CM_CLKEN_PLL_IVA2[3] IVA2_DPLL_DRIFTGUARD	Enable/disable the IVA2 DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[8] IVA2_DPLL_RECAL_EN	Enable/disable the IVA2 DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[8] IVA2_DPLL_ST	Status of the IVA2 DPLL recalibration interrupt to MPU
	PRCM.PRM_IRQENABLE_IVA2[2] IVA2_DPLL_RECAL_EN	Enable/disable the IVA2 DPLL recalibration interrupt to IVA2.2.
	PRCM.PRM_IRQSTATUS_IVA2[2] IVA2_DPLL_ST	Status of the IVA2 DPLL recalibration interrupt to IVA2.2
DPLL3 (CORE)	PRCM.CM_CLKEN_PLL[3] EN_CORE_DPLL_DRIFTGUARD	Enable/disable the CORE DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[5] CORE_DPLL_RECAL	Enable/disable the CORE DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[5] CORE_DPLL_ST	Status of the CORE DPLL recalibration interrupt
DPLL4 (PER)	PRCM.CM_CLKEN_PLL[19] EN_PERIPH_DPLL_DRIFTGUARD	Enable/disable the PER DPLL automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[6] PERIPH_DPLL_RECAL	Enable/disable the PER DPLL recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[6] PERIPH_DPLL_ST	Status of the PER DPLL recalibration interrupt
DPLL5 (PER2)	PRCM.CM_CLKEN2_PLL[3] EN_PERIPH2_DPLL_DRIFTGUARD	Enable/disable the PER DPLL2 automatic recalibration feature.
	PRCM.PRM_IRQENABLE_MPU[25] SND_PERIPH_DPLL_RECAL_EN	Enable/disable the PER DPLL2 recalibration interrupt to MPU.
	PRCM.PRM_IRQSTATUS_MPU[25] SND_PERIPH_DPLL_ST	Status of the PER DPLL2 recalibration interrupt

---

**NOTE:** DPLL recalibration is not necessary in real use (specified operating voltage and temperature range).

---

#### 4.7.6.9 DPLL Programming Sequence

The DPLL programming sequence follows:

1. Set the multiplier (M) and divider (N) values for the desired CLKOUT frequency (see [Section 4.7.6.1](#)).
2. Set the corresponding output dividers (M2, M3, M4, M5, and M6) (see [Section 4.7.6.1](#)).
3. Set the corresponding FREQSEL bit field to satisfy the jitter specification (see [Section 4.7.6.2](#)).
4. Set the corresponding ramp-up delay (see [Section 4.7.6.3](#)).
5. Enable/disable the auto-recalibration feature (see [Section 4.7.6.8](#)).
6. Enable/disable the autoidle feature (see [Section 4.7.6.4](#)).
7. Mask/unmask the interrupt to the MPU (and the DPLL2 interrupt to IVA2) (see [Section 4.7.6.8](#)).
8. Enable the DPLL lock mode (see [Section 4.7.6.4](#)).

#### 4.7.7 Internal Clock Controls

This section describes the software and hardware controls of the internal source clocks. [Figure 4-60](#) through [Figure 4-75](#) list the clock controls. The *Source selection/division* column lists the PRCM register bits used to select or divide the clocks. The *Software control* column lists the PRCM register bits used to enable/disable the clocks. The *Hardware control* column lists the hardware conditions required to effectively gate the clocks.

In the *Hardware control* column, the boxes labeled CL, GS, GC, and HC indicate specific information about the hardware clock controls:

- CL (combinational logic): The functional or interface clock is required by more than one module across more than one power domain. The gating control is the OR combination of all the domain clock requests. If any module of this clock domain requests the clock, the clock is not gated.
- GS (gating selection): The clock is selectable among several possible source clocks for a module. The gating control depends on the software programming of the CM\_CLKSEL\_<domain\_name> type of register. The clock request of the module or domain must be set by the CM\_CLKSEL bit.
- GC (gating control): The functional/interface clock is required by a single module across the power domain. The gating control depends only on the software programming of the FCLKEN/ICLKEN bit. For the interface clock, the enable bit is effective only if autoidle mode is not used. If autoidle mode is used, the gating control also depends on the state of the power domain.
- HC (hardware control): A specific rule not covered by CL, GS, or GC.

---

**NOTE:** Because the PRCM must receive hardware acknowledgement from the different modules before it can gate the clock, the clock is not gated immediately after the software requests clock-gating conditions.

---

### 4.7.7.1 PRM Source-Clock Controls

Figure 4-60 shows the common source-clock controls for the PRM.

**Figure 4-60. Common PRM Source-Clock Controls**

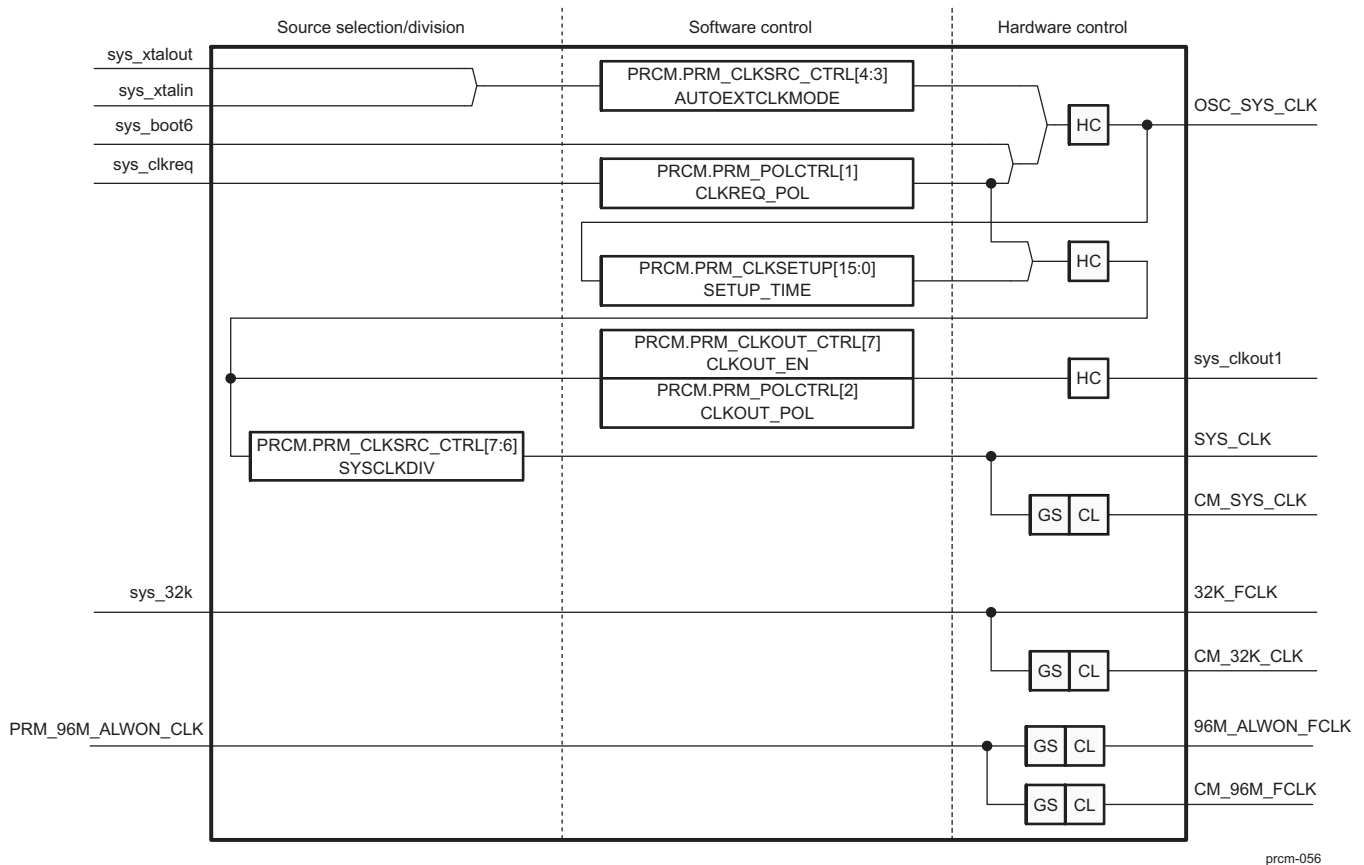

Table 4-49 shows the common source-clock gating controls for the PRM.

**Table 4-49. Common PRM Source-Clock Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
OSC_SYS_CLK	Running	PRCM.PRM_CLKSRC_CTRL[4:3] AUTOEXTCLKMODE and device power state and sys_clkreq	Gated when the oscillator is programmed to power down with the device sleep/retention/off transition.
sys_clkout1	Running	PRCM.PRM_CLKOUT_CTRL[7] CLKOUT_EN and PRCM.PRM_POLCTRL[2] CLKOUT_POL and sys_clkreq	Active when OSC_SYS_CLK is active, sys_clkout1 is enabled, and sys_clkreq is asserted.
SYS_CLK	Running	Activated after clksetup_count_overflow	Active when OSC_SYS_CLK is active and the SYS_CLK setup time is up.
CM_SYS_CLK	Running	PRCM.CM_CLKSEL_CORE[6] CLKSEL_GPT10, PRCM.CM_CLKSEL_CORE[7] CLKSEL_GPT11, and depends on the clock-gating conditions of GPT10_FCLK and GPT11_FCLK	Active if it is the source clock of the GPT10_FCLK or GPT11_FCLK and the functional clock is active.
32K_FCLK	Running	None	Always-active clock from sys_32k input pin
CM_32K_CLK	Running	PRCM.CM_CLKSEL_CORE[6] CLKSEL_GPT10, PRCM.CM_CLKSEL_CORE[7] CLKSEL_GPT11, and depends on the clock-gating conditions of GPT10_FCLK and GPT11_FCLK	Active if it is the source clock of the GPT10_FCLK or GPT11_FCLK and the functional clock is active.
CM_96M_FCLK	Gated	CM_CLKSEL1_PLL[3] SOURCE_48M bit cleared, and depends on the clock-gating condition of 96M_FCLK, 48M_FCLK, and 12M_FCLK	Active if the derived clocks (96M_FCLK, 48M_FCLK, and 12M_FCLK) are active.

**Table 4-49. Common PRM Source-Clock Gating Controls (continued)**

Clock Name	Reset	Clock-Gating Control	Gating Description
96M_ALWON_FCLK	Gated	CM_FCLKEN_PER[0] EN_MCBSP2, CM_FCLKEN_PER[1] EN_MCBSP3, and CM_FCLKEN_PER[2] EN_MCBSP4	Gated when none of the three McBSPs [2..4] have their functional clock enable requested.

The oscillator output clock (OSC\_SYS\_CLK) is gated whenever the PRCM.PRM\_CLKSRC\_CTRL[4:3] AUTOEXTCLKMODE bit field is programmed to power down the oscillator when the device enters retention or off mode. In this condition, all the clock trees in the device must be gated, and the four DPLLs (DPLL1, DPLL2, DPLL3, and DPLL4) must enter stop mode before this transition can occur.

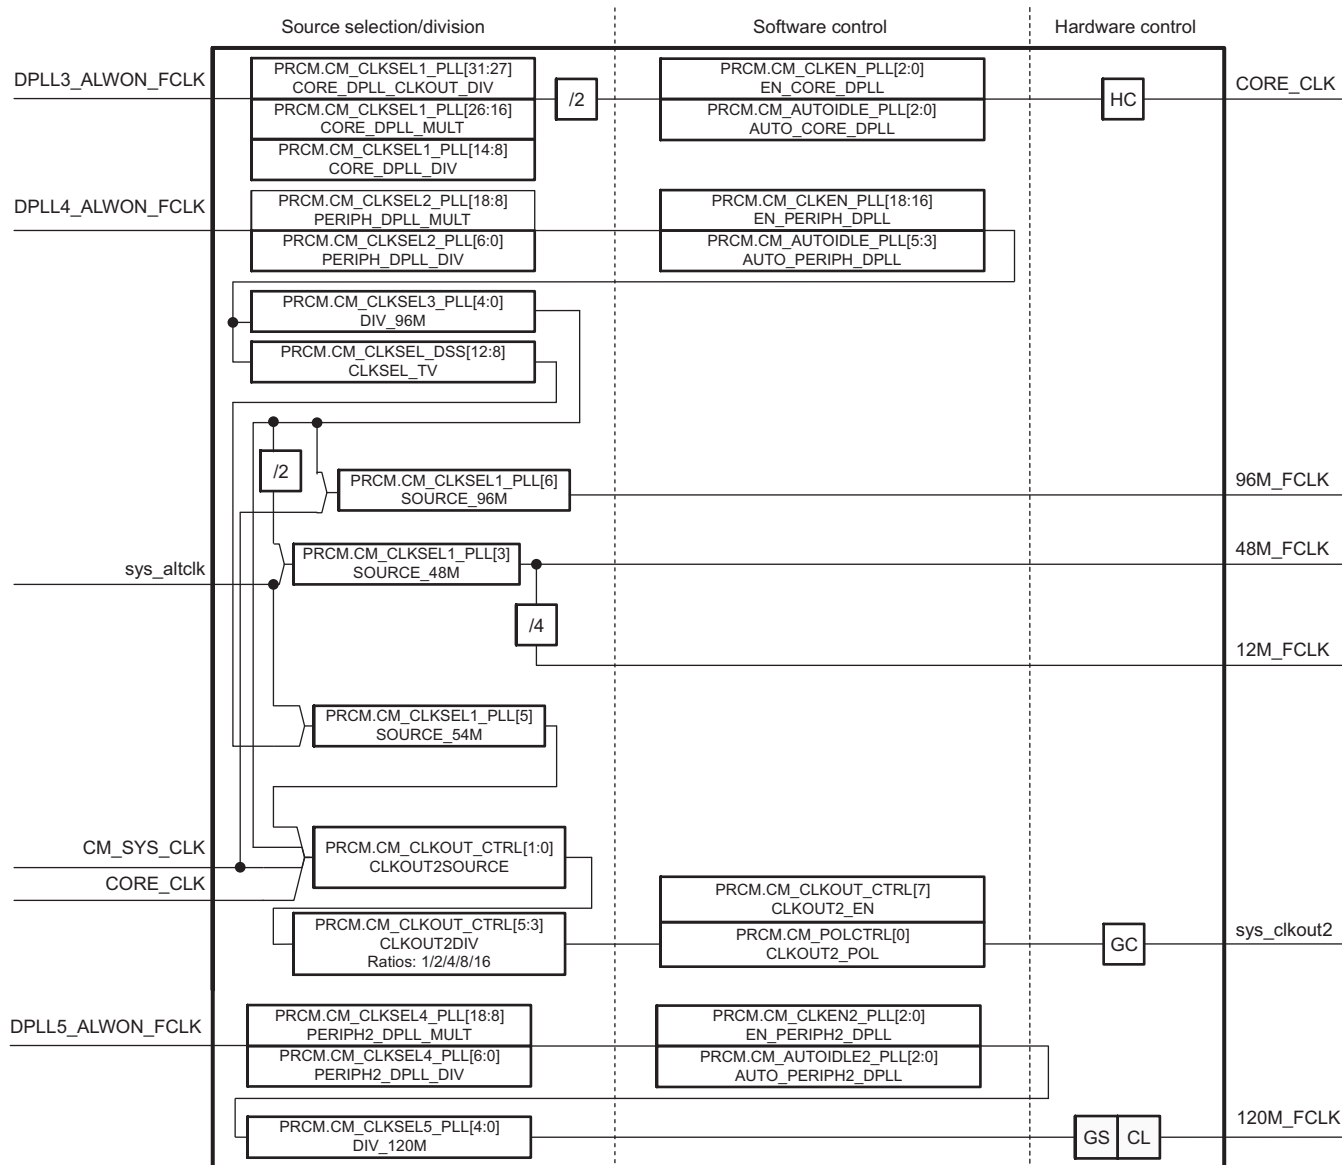

SYS\_CLK is gated under the same conditions as the oscillator output clock, but it is enabled only after the oscillator stabilizes. Oscillator stabilization is determined by a counter overflow configured in the PRCM.PRM\_CLKSETUP[15:0] SETUP\_TIME bit field.

The sys\_clkreq active condition is described in [Section 4.7.5, External Clock Control](#).

### 4.7.7.2 CM Source-Clock Controls

Figure 4-61 shows the common source-clock controls for the CM.

**Figure 4-61. Common CM Source-Clock Controls**

prcm-057

Table 4-50 shows the common source-clock gating controls for the CM.

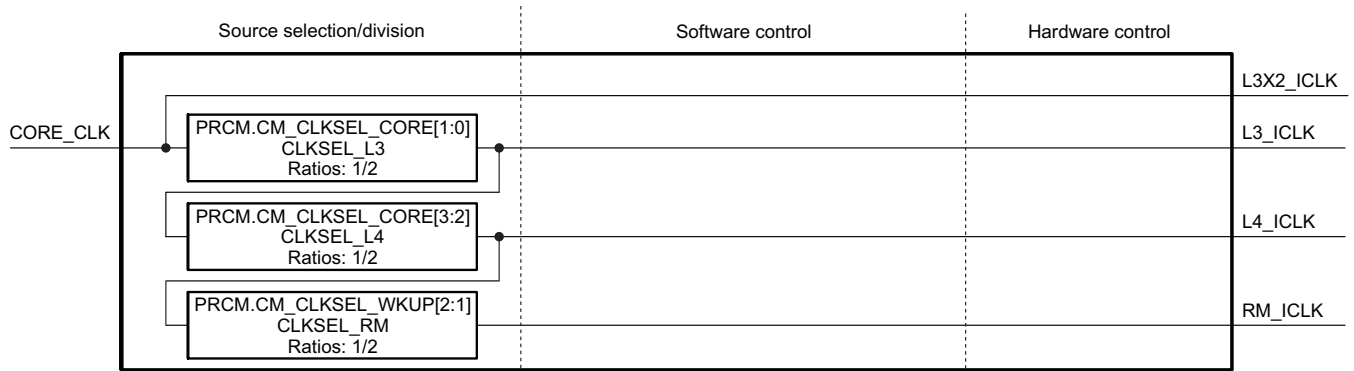

**Table 4-50. Common CM Source-Clock Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
CORE_CLK	Running	Depends on the clock-gating conditions of: L3_ICLK and L4_ICLK	Gated when all interface clocks of the different modules of the device are gated
96M_FCLK	Stopped	Depends on the clock-gating conditions of: CORE_96M_FCLK and DSS_96M_FCLK	If the dependent clocks are active, the clock is active.
48M_FCLK	Stopped	Depends on the clock-gating conditions of CORE_12M_FCLK, PER_48M_FCLK and USBHOST_48M_FCLK	If the dependent clocks are active, the clock is active.
12M_FCLK	Stopped	Depends on the clock-gating conditions of CORE_12M_FCLK	If the dependent clock is active, the clock is active.
sys_clkout2	Stopped	PRCM.CM_CLKOUT_CTRL[7] CLKOUT2_EN	Active if enabled
DPLL4_M2_CLK	Stopped	Depends on the clock-gating conditions of: 96M_FCLK	If the dependent clocks are active, the clock is active.
DPLL4_M3_CLK	Stopped	CM_CLKSEL1_PLL.SOURCE_54M and depends on the clock-gating conditions of: DPLL4_M2_CLK and DSS_TV_CLK	If the dependent clocks are active, the clock is active. DSS_TV_CLK is a dependent clock if set by the register configuration.
120M_FCLK	Stopped	CM_FCLKEN_USBHOST[1] EN_USBHOST2, CM_FCLKEN3_CORE[2] EN_USBTLL, CM_FCLKEN_WKUP[9] EN_USIMOC, CM_CLKSEL_WKUP[6:3] CLKSEL_USIMOC	If any of the dependent clocks (that is, USIM_FCLK, CORE_120M_FCLK, or USBHOST_12M_FCLK) is active, the clock is active. The USIM_FCLK is a dependent clock if set by the register configuration.

**4.7.7.3 Common Interface Clock Controls**

Figure 4-62 shows the clock controls for the common interface.

**Figure 4-62. Common Interface Clock Controls**

prcm-058

Table 4-51 shows the clock-gating controls for the common interface.

**Table 4-51. Common Interface Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
L3X2_ICLK	Running	CORE_CLK gating conditions	Depends on the gating conditions of the CORE_CLK
L3_ICLK	Running	Depends on the clock-gating conditions of: SGX_L3_ICLK, CORE_L3_ICLK, SECURITY_L3_ICLK, CAM_L3_ICLK,	Gated when all L3 interface clocks of the different modules of the device are gated
L4_ICLK	Running	Depends on the clock-gating conditions of CORE_L4_ICLK, SECURITY_L4_ICLK, CAM_L4_ICLK, DSS_L4_ICLK, PER_L4_ICLK, SR_L4_ICLK, and WKUP_L4_ICLK	Gated when all L4 interface clocks of the different modules of the device are gated
RM_ICLK	Running	None	Gated with source clock (CORE_CLK)

### 4.7.7.4 DPLL Source-Clock Controls

Figure 4-63 shows the clock controls for the DPLL power domain.

**Figure 4-63. DPLL Power Domain Clock Controls**

Table 4-52 shows the clock-gating controls for the DPLL power domain.

**Table 4-52. DPLL Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
DPLL1_ALWON_FCLK	Running	PRCM.CM_AUTOIDLE_PLL_MPU[2:0] AUTO_MPU_DPLL, PRCM.CM_CLKEN_PLL_MPU[2:0] EN_MPU_DPLL, and MPU domain power state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the MPU power domain goes into retention or off mode. It is also gated if DPLL is set to low-power bypass mode.
DPLL1_FCLK	Stopped		
DPLL2_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE_PLL_IVA2[2:0] AUTO_IVA2_DPLL, PRCM.CM_CLKEN_PLL_IVA2[2 :0] EN_IVA2_DPLL, and IVA2 power domain power state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the IVA2 power domain goes into retention or off mode. It is also gated if DPLL is set to low-power stop or bypass mode.
DPLL2_FCLK	Stopped		
DPLL3_ALWON_FCLK	Running	PRCM.CM_AUTOIDLE_PLL[2:0] AUTO_CORE_DPLL, PRCM.CM_CLKEN_PLL[2:0] EN_CORE_DPLL, and CORE domain power clocks state	Gated if the DPLL is set to automatic active control and enabled in lock mode while the CORE power domain is idle. It is also gated if DPLL is set to low-power or fast-relock bypass mode.
DPLL4_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE_PLL[5:3] AUTO_PERIPH_DPLL, PRCM.CM_CLKEN_PLL[18:16] EN_PERIPH_DPLL, and depends on the clock-gating conditions of DPLL4_M2_CLK	Gated if the DPLL is set to automatic active control and enabled in lock mode while its dependent clock is inactive. It is also gated if DPLL is set to low-power stop mode.
DPLL5_ALWON_FCLK	Stopped	PRCM.CM_AUTOIDLE2_PLL[2:0] AUTO_PERIPH2_DPLL, PRCM.CM_CLKEN2_PLL[2:0] EN_PERIPH2_DPLL, and depends on the clock-gating conditions of DPLL5_M2_CLK	Gated if the DPLL is set to automatic active control and enabled in lock mode while its dependent clock is inactive. It is also gated if DPLL is set to low-power stop mode.

#### 4.7.7.5 SGX Power Domain Clock Controls

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-64 shows the clock controls for the SGX power domain.

**Figure 4-64. SGX Power Domain Clock Controls**

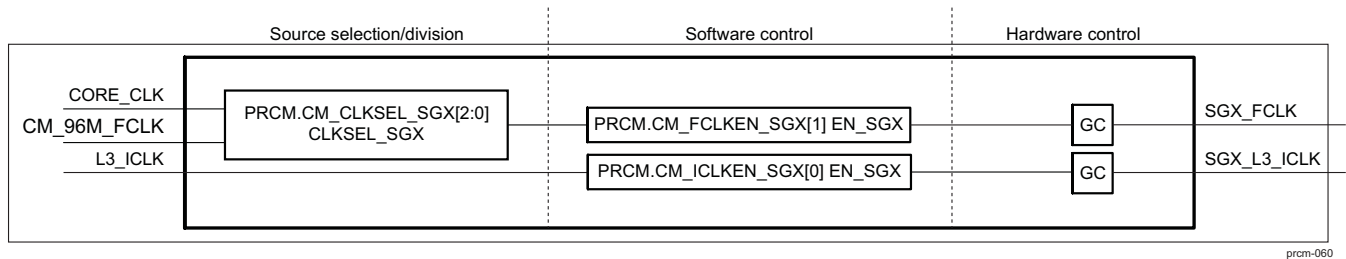

Table 4-53 lists the clock-gating controls for the SGX power domain.

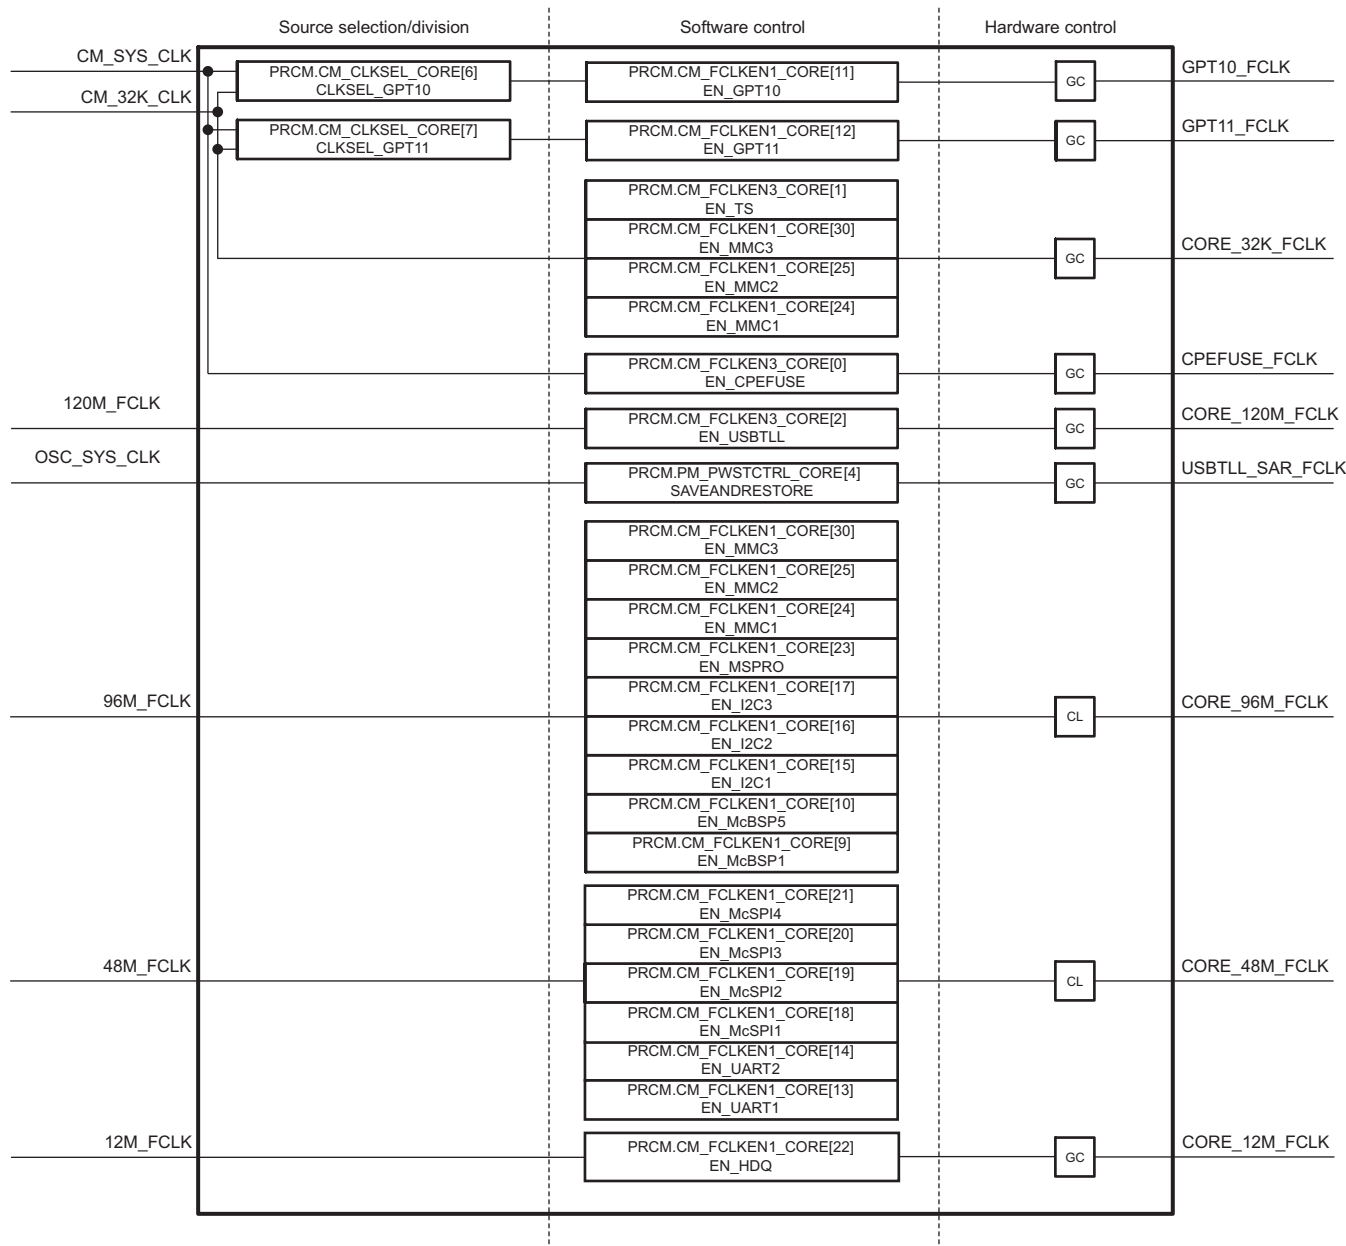

**Table 4-53. SGX Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
SGX_FCLK	Stopped	PRCM.CM_FCLKEN_SGX[1] EN_SGX	Gated when the enable bit is set to 0
SGX_ICLK	Stopped	PRCM.CM_ICLKEN_SGX[1] EN_SGX	Gated when the enable bit is set to 0

### 4.7.7.6 CORE Power Domain Clock Controls

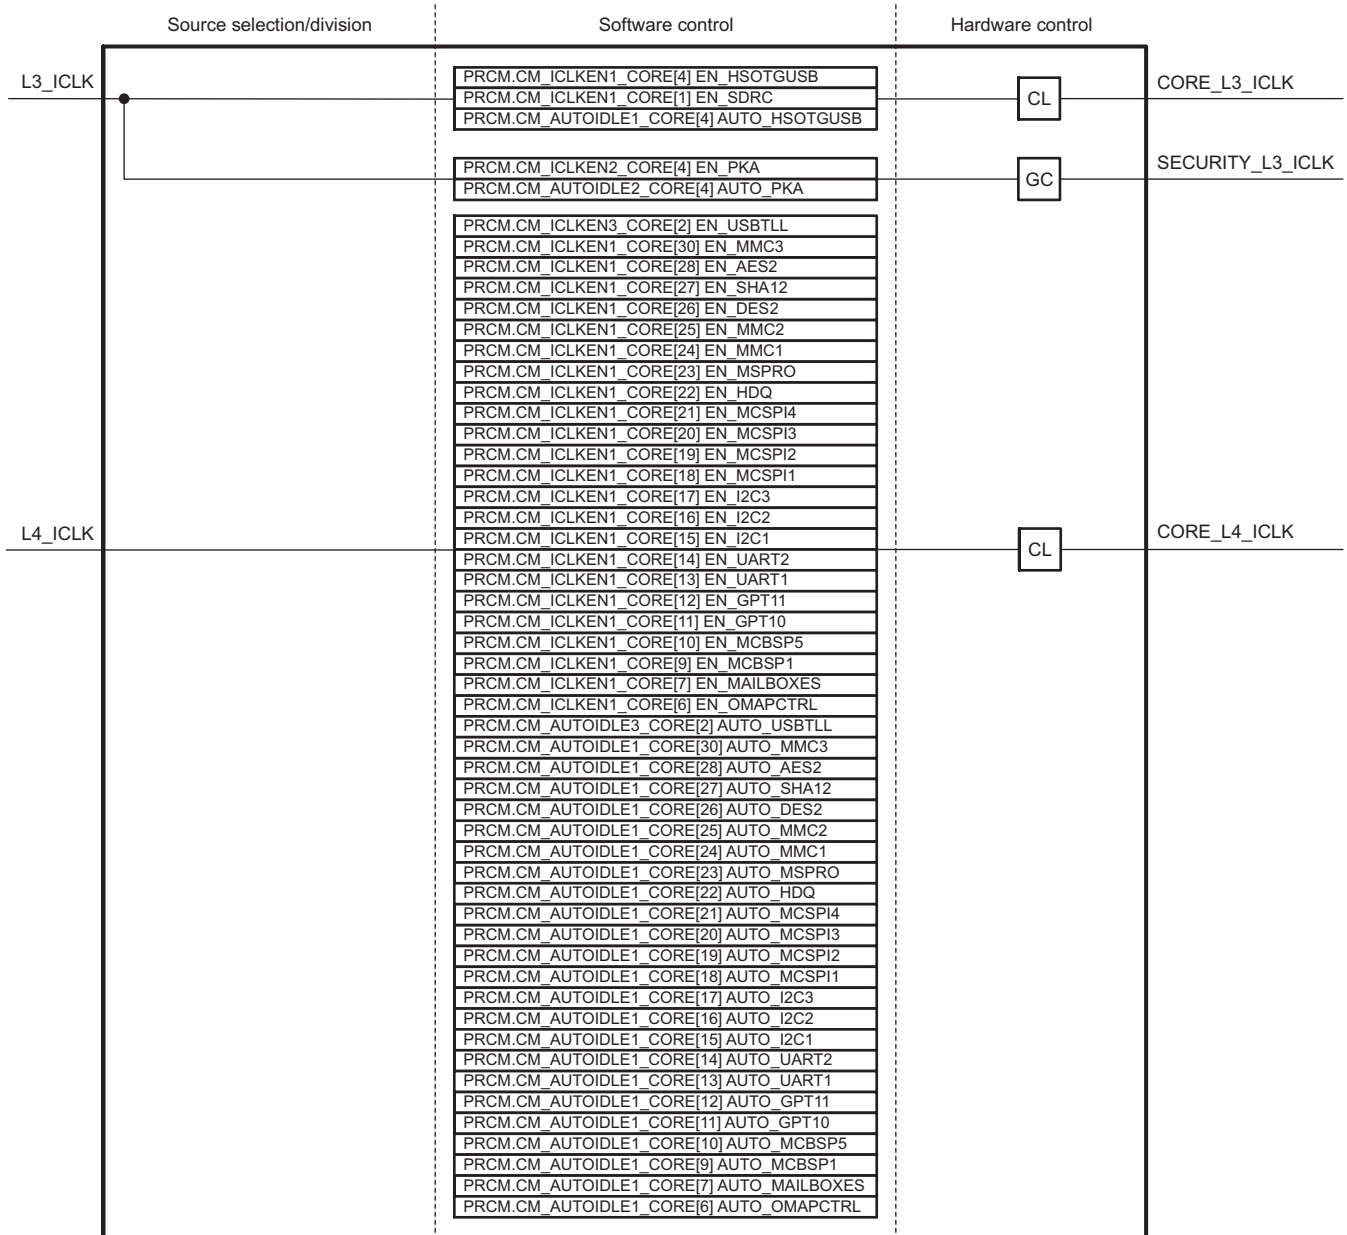

Figure 4-65 through Figure 4-67 show the clock controls for the CORE power domain.

**Figure 4-65. CORE Power Domain Clock Controls: Part 1**

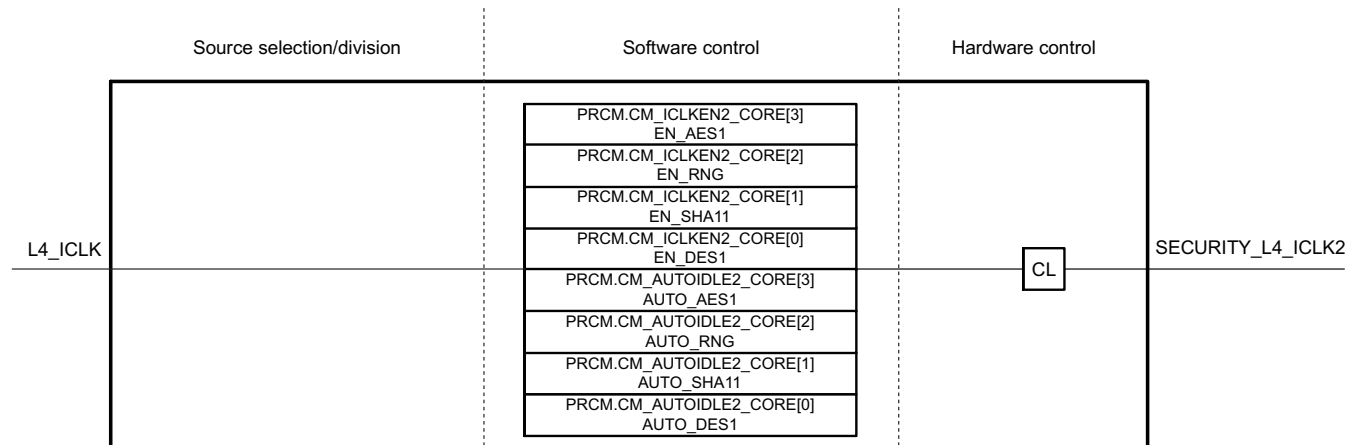

prcm-061

Figure 4-66. CORE Power Domain Clock Controls: Part 2

prcm-062

**Figure 4-67. CORE Power Domain Clock Controls: Part 3**

prcm-063

Table 4-54 lists the clock-gating controls for the CORE power domain.

**Table 4-54. CORE Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
GPT10_FCLK	Stopped	PRCM.CM_FCLKEN1_CORE[11] EN_GPT10	Gated when the enable bit is set to 0
GPT11_FCLK	Stopped	PRCM.CM_FCLKEN1_CORE[12] EN_GPT11	Gated when the enable bit is set to 0
CORE_96M_FCLK	Stopped	McBSP[1..5] input clock source select (in SCM) and PRCM.CM_FCLKEN1_CORE (MMC[1-2], McBSP[1, 5], I2C[1-3], MS-PRO)	Gated when the enable bits of the module functional clock are set to 0. (The McBSPs can have MCBSP_CLKS as an alternate functional clock.)
CORE_48M_FCLK	Stopped	PRCM.CM_FCLKEN1_CORE (UART[1-2], McSPI[1-4])	Gated when the functional clock enable bits of the module are set to 0
CORE_12M_FCLK	Stopped	PRCM.CM_FCLKEN1_CORE[22] EN_HDQ	Gated when the enable bit is set to 0
CORE_L3_ICLK	Running	PRCM.CM_ICLKEN1_CORE EN_(SDRC, HSOTGUSB), PRCM.CM_AUTOIDLE1_CORE4 AUTO_HSOTGUSB	Gated when: 1. All enable bits are set to 0. 2. The enable-autoidle bit pair is set to 1, the remaining enable bits are set to 0, and the clock is not requested by any module.
CORE_L4_ICLK	Running	PRCM.CM_ICLKEN1_CORE (AES2, SHAM2, D3D2, MMC[1..2], MS-PRO, HDQ, MCSP[1-4], I2C[1-3], UART[1,2], GPT[10,11], MCBSP[1,5], MAILBOXES, OMAPCTRL) and PRCM.CM_AUTOIDLE1_CORE (AES2, SHAM2, D3D2, MMC[1..2], MS-PRO, HDQ, MCSP[1-4], I2C[1-3], UART[1,2], GPT[10,11], MCBSP[1,5], MAILBOXES, OMAPCTRL)	Gated when: 1. All enable bits are set to 0. 2. All enable-autoidle bit pairs are set to 1, and the clock is not requested by any module.
SECURITY_L3_ICLK	Stopped	PRCM.CM_ICLKEN2_CORE[4] EN_PKA ,PRCM.CM_AUTOIDLE2_CORE[4] AUTO_PKA	Gated when:
SECURITY_L4_ICLK2	Running		1. Enable bit is set to 0. 2. Enable-autoidle bit pair is set to 1, and the clock is not requested by any module.

**Table 4-54. CORE Power Domain Clock-Gating Controls (continued)**

Clock Name	Reset	Clock-Gating Control	Gating Description
SECURITY_L4_ICLK2	Stopped	PRCM.CM_ICLKEN2_CORE EN_(AES1, RNG1, SHAM1, D3D1) and PRCM.CM_AUTOIDLE2_CORE[4] AUTO_(AES1, RNG1, SHAM1, D3D1)	Gated when: 1. All enable bits are set to 0. 2. All enable-autoidle bit pairs are set to 1, and the clock is not requested by any module.
CORE_32K_FCLK	Stopped	CM_FCLKEN1_CORE[24] EN_MMC1, CM_FCLKEN1_CORE[25] EN_MMC2, CM_FCLKEN1_CORE[30] EN_MMC3, CM_FCLKEN3_CORE[1] EN_TS	Gated when: 1. All enable bits are set to 0.
CPEFUSE_FCLK	Stopped	CM_FCLKEN3_CORE[0] EN_CPEFUSE	Gated when CPEFUSE autoload sequence is performed, and the enable bit is set to 0
CM_USIM_CLK	Stopped	CM_FCLKEN_WKUP[9] EN_USIMOCP	Gated when the enable bit is set to 0
USBTLL_SAR_FCLK	Stopped	CORE power domain power state and PM_PWSTCTRL_CORE[4] SAVEANDRESTORE	Gated when the save-restore bit is set to 0, or when the CORE power domain is in OFF state after the save operation completes or in ON state after the restore operation completes.
CORE_120M_FCLK	Stopped	CM_FCLKEN3_CORE[0] EN_USBTLL and DPLL5 operating mode	Gated when the enable bit is set to 0, or the DPLL5 is in stop or bypass mode

**4.7.7.7 EFUSE Power Domain Clock Controls**

Figure 4-68 shows the clock controls for the EFUSE power domain. Table 4-55 lists the clock-gating control for the EFUSE power domain.

**Figure 4-68. EFUSE Power Domain Clock Controls**

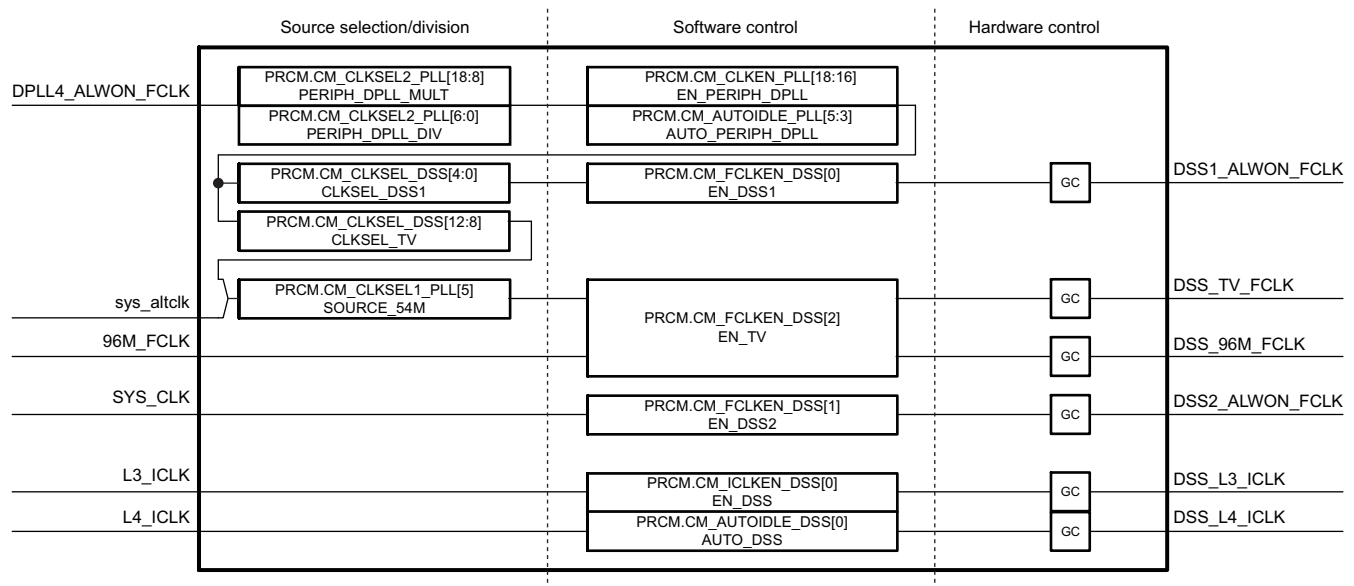

**Table 4-55. EFUSE Power Domain Clock-Gating Control**

Clock Name	Reset	Clock-Gating Control	Gating Description
EFUSE_ALWON_FCLK	Running	None	Active when VDD1 and VDD2 are switched on and eFuse-ready hardware signal is released

**4.7.7.8 DSS Power Domain Clock Controls**

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-69 shows the clock controls for the DSS power domain. Table 4-56 lists the clock-gating controls for the DSS power domain.

**Figure 4-69. DSS Power Domain Clock Controls**

prcm-065

**Table 4-56. DSS Power Domain Clock-Gating Controls**

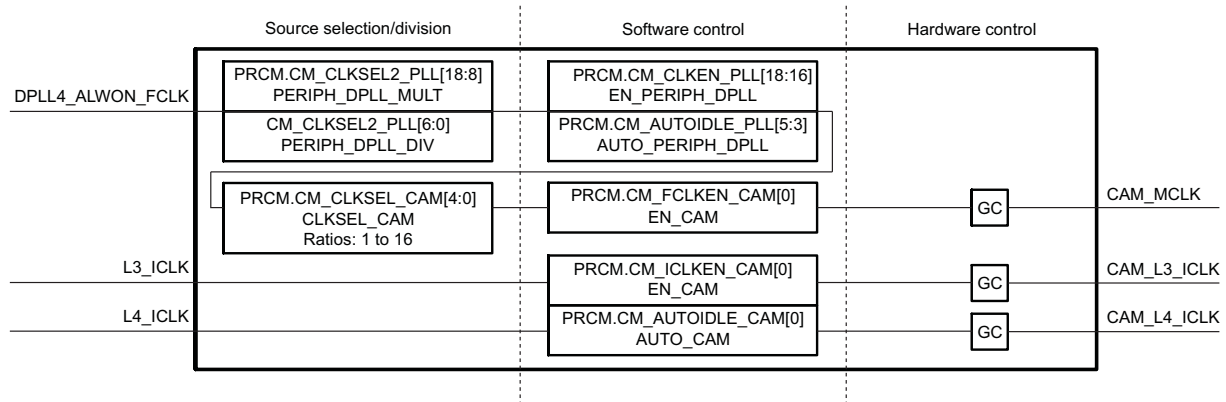

Clock Name	Reset	Clock-Gating Control	Gating Description
DSS1_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_DSS[0] EN_DSS1	Gated when the enable bit is set to 0
DSS2_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_DSS[1] EN_DSS2	Gated when the enable bit is set to 0
DSS_TV_FCLK	Stopped	PRCM.CM_FCLKEN_DSS[2] EN_TV	Gated when the enable bit is set to 0
DSS_96M_FCLK	Stopped		
DSS_L3_ICLK	Stopped	PRCM.CM_ICLKEN_DSS[0] EN_DSS, PRCM.CM_AUTOIDLE_DSS[0] AUTO_DSS	Gated when: <ol style="list-style-type: none"> <li>1. Enable bit is set to 0.</li> <li>2. Enable-autoload bit pair is set to 1, and the clock is not requested by any module.</li> </ol>
DSS_L4_ICLK	Stopped		

#### 4.7.7.9 CAM Power Domain Clock Controls

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

Figure 4-70 shows the clock controls for the CAM power domain. Table 4-57 lists the clock-gating controls for the CAM power domain.

Figure 4-70. CAM Power Domain Clock Controls

prcm-066

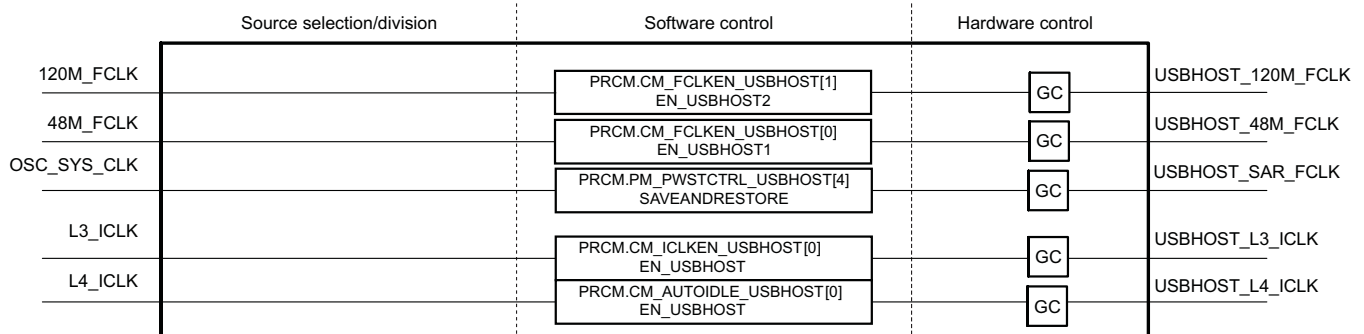

Table 4-57. CAM Power Domain Clock-Gating Controls

Clock Name	Reset	Clock-Gating Control	Gating Description
CAM_MCLK	Stopped	PRCM.CM_FCLKEN_CAM[0] EN_CAM	Gated when the enable bit is set to 0
CAM_L3_ICLK	Stopped	PRCM.CM_ICLKEN_CAM[0] EN_CAM, PRCM.CM_AUTOIDLE_CAM[0] AUTO_CAM	Gated when:
CAM_L4_ICLK	Stopped		1. Enable bit is set to 0.  2. Enable-autoidle bit pair is set to 1, and the clock is not requested by subsystem.

4.7.7.10 USBHOST Power Domain Clock Controls

Figure 4-71 shows the clock controls for the USBHOST power domain. Table 4-58 lists the clock-gating controls for the USBHOST power domain.

Figure 4-71. USBHOST Power Domain Clock Controls

prcm-091

Table 4-58. USBHOST Power Domain Clock-Gating Controls

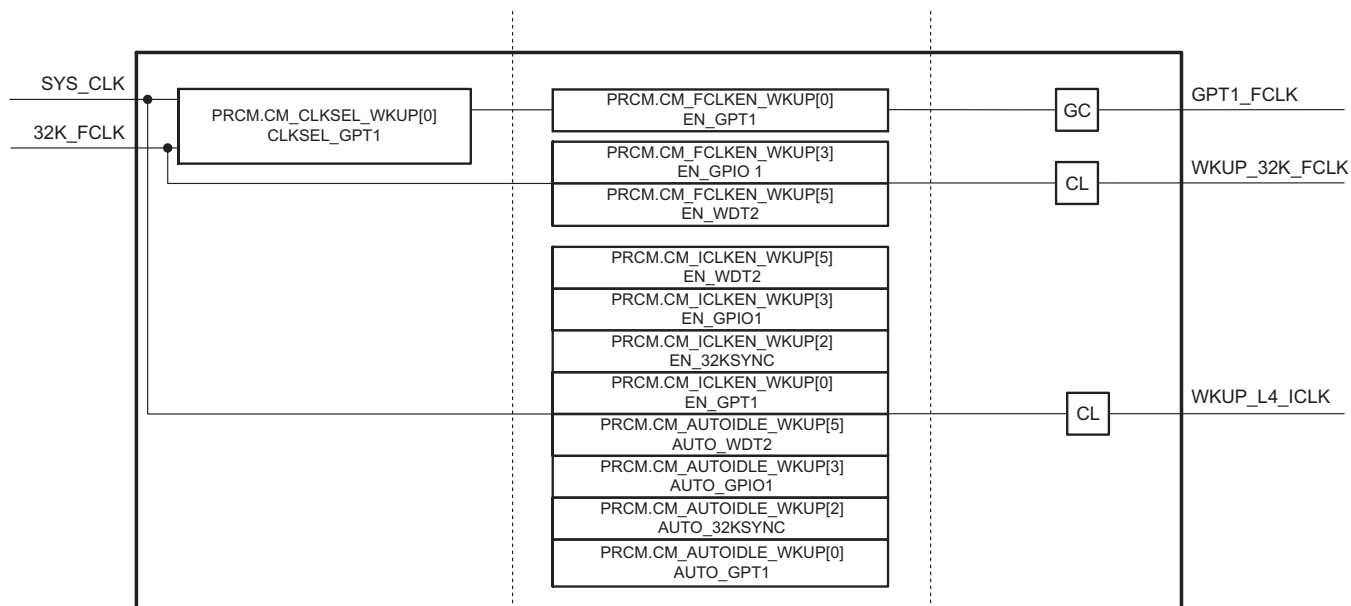

Clock Name	Reset	Clock-Gating Control	Gating Description
USBHOST_48M_FCLK	Stopped	PRCM.CM_FCLKEN_USBHOST[0] EN_USBHOST1	Gated when the enable bit is set to 0
USBHOST_120M_FCLK	Stopped	PRCM.CM_FCLKEN_USBHOST[1] EN_USBHOST2	Gated when the enable bit is set to 0

**Table 4-58. USBHOST Power Domain Clock-Gating Controls (continued)**

Clock Name	Reset	Clock-Gating Control	Gating Description
USBHOST_L3_ICLK	Stopped	PRCM.CM_ICLKEN_USBHOST[0] EN_USBHOST, PRCM.CM_AUTOIDLE_USBHOST[0] AUTO_USBHOST	Gated when: 1. Enable bit is set to 0.
USBHOST_L4_ICLK	Stopped		2. Enable-autoidle bit pair is set to 1, and the clock is not requested by subsystem.
USBHOST_SAR_FCLK	Stopped	PRCM.PM_PWSTCTRL_USBHOST[4] SAVEANDRESTORE	Gated when the save-restore bit is set to 0, or when the power domain is in OFF state after the save operation completes or in ON state after the restore operation completes.

#### 4.7.7.11 WKUP Power Domain Clock Controls

Figure 4-72 shows the clock controls for the WKUP power domain. Table 4-59 lists the clock-gating controls for the WKUP power domain.

**Figure 4-72. WKUP Power Domain Clock Controls**

prcm-067

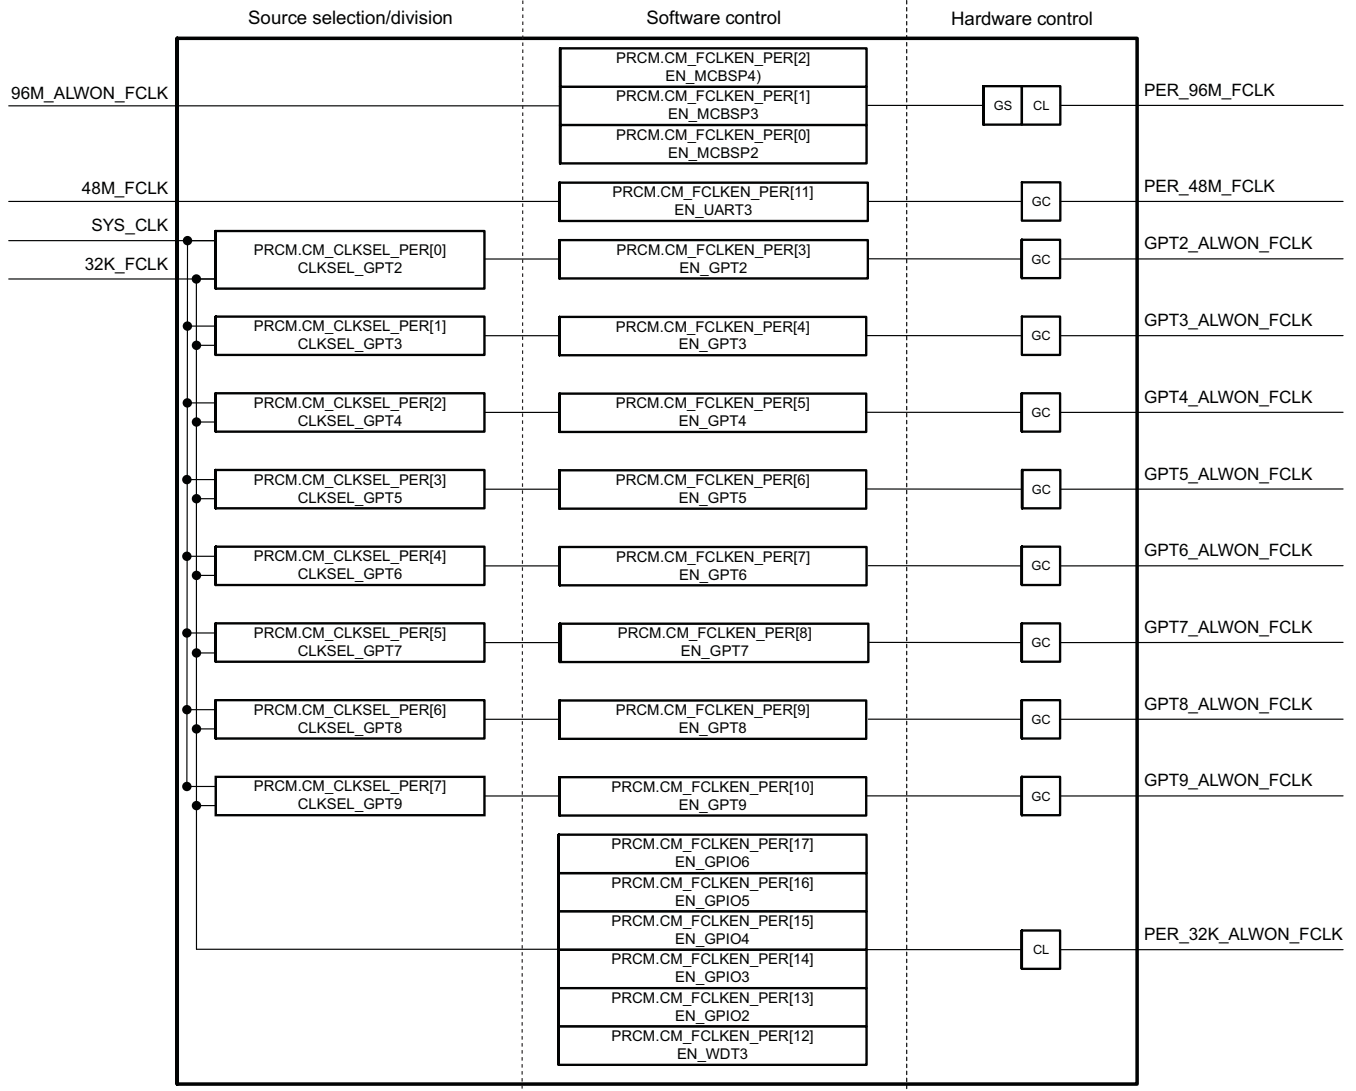

**Table 4-59. WKUP Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
GPT1_FCLK	Stopped	PRCM.CM_FCLKEN_WKUP[0] EN_GPT1	Gated when the enable bit is set to 0
WKUP_32K_FCLK	Stopped	PRCM.CM_FCLKEN_WKUP[3] GPIO1 and PRCM.CM_FCLKEN_WKUP[5] WDT2	Gated when the enable bits are set to 0
SECURE_32K_FCLK	Running	None	
WKUP_L4_ICLK	Running	PRCM.CM_ICLKEN_WKUP EN_(WDT[1,2], GPIO1, 32KSYNC, GPTIMER[1,12]), PRCM.CM_AUTOIDLE_WKUP AUTO_ (WDT[1,2], GPIO1, 32KSYNC, and GPTIMER[1,12])	Gated when: 1. All enable bits are set to 0. 2. All enable-autoidle bit pairs are set to 1, and the clock is not requested by any module.
USIM_FCLK	Running	PRCM.CM_FCLKEN_WKUP[9] EN_USIMOCP	Gated when the enable bit is set to 0

4.7.7.12 PER Power Domain Clock Controls

Figure 4-73 and Figure 4-74 show the clock controls for the PER power domain.

Figure 4-73. PER Power Domain Clock Controls: Part 1

prcm-068

prcm-069

Table 4-60 lists the clock-gating controls for the PER power domain.

**Table 4-60. PER Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
PER_48M_FCLK	Stopped	PRCM.CM_FCLKEN_PER[11] EN_UART3	Gated when the enable bit is set to 0
PER_96M_FCLK	Stopped	McBSP[2..4] input clock source select (in SCM) and PRCM.CM_FCLKEN_PER EN_MCBSP[2-4] and the DPLL4 operating mode	Gated when the enable bits of the module functional clock are set to 0 (the McBSPs can have MCBSP_CLKS as an alternate functional clock) or DPLL4 is in stop or bypass mode
MCBSP_CLKS	Stopped	See the <i>System Control Module</i> chapter.	
PER_32K_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER EN_GPIO[2-6] and PRCM.CM_FCLKEN_PER[12] EN_WDT3	Gated when all the enable bits are set to 0
GPT2_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[3] EN_GPT2	Gated when the enable bit is set to 0
GPT3_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[4] EN_GPT3	Gated when the enable bit is set to 0
GPT4_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[5] EN_GPT4	Gated when the enable bit is set to 0
GPT5_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[6] EN_GPT5	Gated when the enable bit is set to 0
GPT6_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[7] EN_GPT6	Gated when the enable bit is set to 0
GPT7_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[8] EN_GPT7	Gated when the enable bit is set to 0
GPT8_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[9] EN_GPT8	Gated when the enable bit is set to 0
GPT9_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_PER[10] EN_GPT9	Gated when the enable bit is set to 0
PER_L4_ICLK	Stopped	PRCM.CM_ICLKEN_PER EN_(GPIO[2..6], WDT3, UART3, GPT[2..9], MCBSP[2..4]) and PRCM.CM_AUTOIDLE_PER AUTO_(GPIO[2..6], WDT3, UART3, GPT[2..9], and MCBSP[2..4])	Gated when: 1. All enable bits are set to 0. 2. All enable-autoidle bit pairs are set to 1, and the clock is not requested by any module.
96M_ALWON_FCLK	Stopped	None	Always-on clock

For audio applications, the McBSP functional clocks are provided externally by the MCBSP\_CLKS pin. This clock must be permanently supplied, to allow McBSPs to function when the CORE power domain is in the OFF power state. If the external clock input is selected as the functional clock, the PER power domain sleep transition is prevented.

**4.7.7.13 SMARTREFLEX Power Domain Clock Controls**

Figure 4-75 shows the clock controls for the SMARTREFLEX power domain. Table 4-61 lists the clock-gating controls for the SMARTREFLEX power domain.

**Figure 4-75. SMARTREFLEX Power Domain Clock Controls**

**Table 4-61. SMARTREFLEX Power Domain Clock-Gating Controls**

Clock Name	Reset	Clock-Gating Control	Gating Description
SR_ALWON_FCLK	Stopped	PRCM.CM_FCLKEN_WKUP[6] EN_SR1 and PRCM.CM_FCLKEN_WKUP[7] EN_SR2	Gated when both enable bits are set to 0
SR_L4_ICLK	Running	Depends on L4_ICLK activity (hardware control)	

**4.7.8 Clock Configurations**

The device supports several clock configurations. A clock configuration is a consistent set of divider ratios programmed into PRCM to obtain a certain combination of clock speed to match the performance requirement.

In the device the MPU and IVA2.2 processors are connected to the interconnects through asynchronous bridges, the functional frequency of these processors can be configured independently of their interface clock frequency.

Therefore, the clock configurations of the device are split into two sections: one for device processor clocks, and the other for device interface clocks.

An operating performance point of the device may be defined as a pair of device operating voltage and corresponding frequency. The device processors are in the VDD1 voltage domain and the interface clocks are generated by the CM clock generator in the VDD2 voltage domain. Hence, the OPPs of the processor clocks are identified for the VDD1 voltage levels, independent of the interface clocks which are associated to the VDD2 voltage levels.

#### CAUTION

Clock configurations depend on device operating voltage values. Please refer to your device-specific data manual for a description of the supported voltage levels and maximum clock frequencies.

#### 4.7.8.1 Processor Clock Configurations

The processor operating performance points are identified as the pair of VDD1 operating voltage level and the processor clocks frequency.

Five generic processor operating performance points may be defined as:

1. OPP5 (VDD1 = v4 , (MPU\_CLK =  $f_{mpu4}$ , IVA2\_CLK =  $f_{iva4}$  ))
2. OPP4 (VDD1 = v3 , (MPU\_CLK =  $f_{mpu3}$ , IVA2\_CLK =  $f_{iva3}$  ))
3. OPP3 (VDD1 = v2 , (MPU\_CLK =  $f_{mpu2}$ , IVA2\_CLK =  $f_{iva2}$  ))
4. OPP2 (VDD1 = v1 , (MPU\_CLK =  $f_{mpu1}$ , IVA2\_CLK =  $f_{iva1}$  ))
5. OPP1 (VDD1 = v0 , (MPU\_CLK =  $f_{mpu0}$ , IVA2\_CLK =  $f_{iva0}$  ))

where  $v4 > v3 > v2 > v1 > v0$  ,

$f_{mpu4} > f_{mpu3} > f_{mpu2} > f_{mpu1} > f_{mpu0}$ ,

$f_{iva4} > f_{iva3} > f_{iva2} > f_{iva1} > f_{iva0}$  and

$f_{mpu}$  may not be equal to  $f_{iva}$

The clock configuration for the MPU and the IVA applies to following clocks of the device:

- DPLL1 (MPU DPLL) synthesized clock frequency (CLKOUTX2) configured by setting the M and N parameters of the DPLL
- DPLL1 (MPU DPLL) output clock frequency (MPU\_CLK) configured by setting the M2 parameter of the DPLL

---

**NOTE:** The MPU\_CLK is divided by 2 inside the MPU subsystem to generate the ARM\_FCLK This divider is only active when the DPLL is locked. (Refer to MPU Subsystem for information on ARM\_FCLK).

---

- DPLL2 (IVA2 DPLL) synthesized clock frequency (CLKOUT) configured by setting the M and N parameters of the DPLL
- DPLL2 (IVA2 DPLL) output clock frequency (IVA2\_CLK) configured by setting the M2 parameter of the DPLL

The frequency of the processor clocks (MPU\_FCLK and IVA2\_FCLK) must be configured according to the selected OPP (the clock frequency associated with the operating voltage VDD1). [Table 4-62](#) identifies the clocks of the processors, their source clocks, and the configuration register bit fields.

**Table 4-62. Processor Clock Configuration Controls**

Module	Clocks	Reference Clock	Multiplier (factors)	Divider (factors)	Configuration Bits
DPLL1	CLKOUT X2	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL_MPU[18:8] MPU_DPLL_MULT
				N (0 ... 127)	PRCM.CM_CLKSEL1_PLL_MPU[6:0] MPU_DPLL_DIV
	MPU_CLK K <sup>(1)</sup>	CLKOUTX2		M2	PRCM.CM_CLKSEL2_PLL_MPU[4:0] MPU_DPLL_CLKOUT_DIV
DPLL2	CLKOUT	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL_IVA2[18:8] IVA2_DPLL_MULT
				N (0 ... 127)	PRCM.CM_CLKSEL1_PLL_IVA2[6:0] IVA2_DPLL_DIV
	IVA2_CLK	CLKOUT		M2 (1 ... 16)	PRCM.CM_CLKSEL2_PLL_IVA2[4:0] IVA2_DPLL_CLKOUT_DIV

<sup>(1)</sup> The MPU\_CLK is divided by 2 inside the MPU subsystem to generate the ARM\_FCLK. This divider is only active when the DPLL is locked. (Refer to MPU Subsystem for information on ARM\_FCLK).

**Table 4-63. Processor Clock Configurations**

CLOCK	BYPASS	LOCKED
MPU_CLK	DPLL1_FCLK (Bypass Clock from DPLL3)	(SYS_CLK * M * 2) / ([N+1] * M2)
ARM_FCLK	MPU_CLK	MPU_CLK / 2
MPUSS Internal Modules Clocks	ARM_FCLK / 2	ARM_FCLK / 2

#### 4.7.8.2 Interface and Peripheral Functional Clock Configurations

The interface clocks operating performance points are identified as the pair of VDD2 operating voltage level and the device interface clocks frequencies.

The DPLL3 (CORE DPLL) generates the CORE\_CLK which serves as the source clock for the L3\_ICLK and L4\_ICLK interface clocks of the device. The CORE\_CLOCK is also used by the DPLL1 and DPLL2 as the bypass clock. The L3\_ICLK is supplied to the SGX module as SGX\_L3\_ICLK and is used as its functional clock. The L4\_ICLK is used by RM\_L4\_CLK as its source clock.

The interface and peripheral functional clocks frequencies can be configured according to the device performance requirements for the OPP.

DPLL3 synthesized clock frequencies are configured as:

- $f_{\text{CLKOUT}} = (f_{\text{SYS\_CLK}} \times M) / (N+1)$
- $f_{\text{CLKOUTX2}} = f_{\text{CLKOUT}} \times 2$

DPLL3 output clock frequencies are configured as:

- $f_{\text{CORE\_CLK}} = f_{\text{CLKOUT}} / M2$
- $f_{\text{COREX2\_CLK}} = f_{\text{CLKOUTX2}} / M2$

L3\_ICLK, L4\_ICLK and RM\_L4\_ICLK frequencies are configured as:

- $f_{\text{L3\_ICLK}} = f_{\text{CORE\_CLK}} / \text{DIV\_L3}$
- $f_{\text{L4\_ICLK}} = f_{\text{L3\_ICLK}} / \text{DIV\_L4}$
- $f_{\text{RM\_L4\_ICLK}} = f_{\text{L4\_ICLK}} / \text{DIV\_RM}$

Table 4-64 identifies the interface clocks, their reference clocks, and the control bits for configuration of the interface clock frequencies.

**Table 4-64. Interface Clock Configuration Controls**

Module	Clock	Reference Clock	Multiplier (Factor)	Divider (Factor)	Configuration Bits
DPLL3	CLKOUT	SYS_CLK	M (0 ... 2047)		PRCM.CM_CLKSEL1_PLL[26:16] CORE_DPLL_MULT
	CLKOUTX2			N (0 ... 127)	PRCM.CM_CLKSEL1_PLL[14:8] CORE_DPLL_DIV
CORE_CLK	CORE_CLK	CLKOUT		M2 (1 ... 31)	PRCM.CM_CLKSEL1_PLL[31:27] CORE_DPLL_CLKOUT_DIV
	COREX2_CLK	CLKOUTX2			
L3 interconnect	L3_ICLK	CORE_CLK		DIV_L3 (1 ... 2)	PRCM.CM_CLKSEL_CORE[1:0] CLKSEL_L3
L4 interconnect	L4_ICLK	L3_ICLK		DIV_L4 (1 ... 2)	PRCM.CM_CLKSEL_CORE[3:2] CLKSEL_L4
RM clock	RM_L4_ICLK	L4_ICLK		DIV_RM (1 ... 2)	PRCM.CM_CLKSEL_WKUP[2:1] CLKSEL_RM

SGX\_FCLK, DPLL1\_FCLK (bypass mode) and DPLL2\_FCLK (bypass mode) frequencies are configured as:

- $f_{SGX\_FCLK} = f_{CORE\_CLK} / DIV\_SGX$
- $f_{SGX\_FCLK} = f_{CM\_96M\_FCLK}$
- $f_{DPLL1\_FCLK} = f_{CORE\_CLK} / DIV\_DPLL1$
- $f_{DPLL2\_FCLK} = f_{CORE\_CLK} / DIV\_DPLL2$

Table 4-65 identifies the functional clocks, their reference clocks and the control bits for configuration of the functional clock frequencies.

**Table 4-65. Functional Clock Configuration Controls**

Module	Clock	Reference Clock	Divider (Factor)	Configuration Bits
SGX	SGX_FCLK	CORE_CLK CM_96M_FCLK	DIV_SGX (3, 4, 6)	PRCM.CM_CLKSEL_SGX[2:0] CLKSEL_SGX PRCM.CM_CLKSEL_SGX[2:0] CLKSEL_SGX
MPU HS bypass	DPLL1_FCLK	CORE_CLK	DIV_DPLL1 (1, 2, 4)	PRCM.CM_CLKSEL1_PLL_MPU[20:19] MPU_CLK_SRC
IVA2 HS bypass	DPLL2_FCLK	CORE_CLK	DIV_DPLL2 (1, 2, 4)	PRCM.CM_CLKSEL1_PLL_IVA2[20:19] IVA2_CLK_SRC

The rest of the functional clocks are issued from DPLL4 and DPLL5 and remain invariable, regardless of the interface clock configuration. In all clock configurations, any divider ratio to generate functional clocks is applicable, provided it complies with the maximum frequency specification.

## 4.8 PRCM Idle and Wake-Up Management

### 4.8.1 Overview

When a group of modules belonging to a clock domain in a power domain do not require a clock (interface or functional), the PRCM can be programmed to automatically cut the clock to those modules, thereby reducing their power consumption. The PRCM can then switch the power domain to low-power retention or off mode to ensure minimum power consumption. When all clocks in a domain are cut, the domain is idle.

Similarly, when a module belonging to a power domain in low-power idle mode is required to switch to active mode, the PRCM switches on the power to the entire power domain and activates the necessary clock signals to the module. This is a wake-up transition. Generally, a wake-up event triggers the wake-up transition.

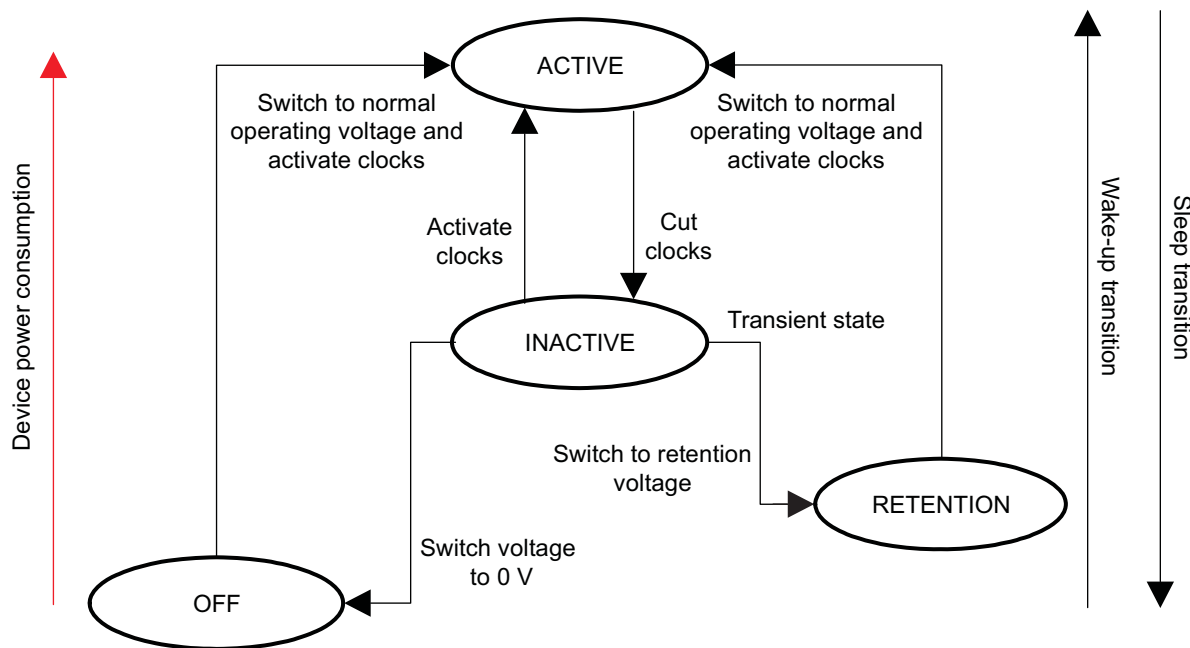

A sleep/wake-up dependency can be defined between different power domains. A sleep dependency ensures that a power domain does not make a sleep transition unless all the dependent power domains are in idle mode and do not require the power domain. Similarly, a wake-up dependency ensures that a power domain wakes up when any of its dependent power domains wakes up.

The PRCM automatically handles the sequence clock-gating conditions and power switching for each power domain, based on the configured dependencies between the domains and the clock-control bits of the modules.

[Figure 4-76](#) shows the sleep/wake-up transition of the power domains. The INACTIVE state is a transient power state of a power domain, while moving from ACTIVE to either RETENTION or OFF power state. In the INACTIVE state all the domain clocks are gated. A power domain can not switch from OFF to RETENTION or RETENTION to OFF power state without passing first to the ACTIVE power state.

A lower power state, i.e., INACTIVE, RETENTION or OFF, means lesser power consumption. However, the wake-up latency increases as the power domain switches to INACTIVE, RETENTION or OFF power state, respectively.

Figure 4-76. Power Domain Sleep/Wake-Up Transition

prcm-071

Functionally, the PRCM is composed of a single global control block and a power-control block for each power domain. The domain power-control block handles power switching, wake-up events, and clock-gating control for the domain. The domain power controllers communicate with each other for power sequencing, sleep dependencies, and wake-up dependencies. All these blocks interact with the global control block that handles reset management, clock generation and distribution, and all PRCM registers.

Figure 4-77. Device Power Reset and Clock Controllers

prcm-072

Figure 4-77 details the functions within one power domain block:

- A module clock controller (for example, module X clock controller) uses a hardware handshake protocol to communicate directly with the module. It controls the idle transition of the target module and responds to the standby requests of the initiator module (for details, see [Section 4.1.4.2, Autoidle Clock Control](#)). Depending on the mode, the clock controller sends clock commands (enable/disable) to the clock generator. The registers that control the functional and interface clocks in the module are directly mapped to the module clock controller.
- The domain clock controller gathers information from the following:
  - All module clock controllers of the power domain
  - The domain power controller
  - The domain wake-up controller
  - The other power domain control blocks

The domain clock controller informs the domain power controller when all conditions for the domain power transition are met (domain clocks are idle, no initiator is requesting service, no wake-up event is pending) to allow a domain power transition. On a wake-up event, the domain clock controller starts the module domain clocks, if power is present.

- The domain power controller communicates with the domain clock controller, the domain wake-up controller, and the PSCON. Depending on the register settings for clock domain activity (idle or active), it sends requests to the PSCON to power down/up the domain logic and memory, or to enable retention mode.
- The PSCON sequences all sleep and wake-up transitions between on, off, and retention modes for both logic and memory. It also ensures that the domain is properly isolated when it enters into off or

retention mode.

- The domain wake-up controller gathers all events that can wake up the power domain. Some events are active only when the domain is on (these are used to switch on the clocks, when required); others also allow domain power up. These events can be internal (coming from the modules in the power domain, such as general-purpose [GP] timer time-out), external (coming from another power domain control block dependency), or global (voltage stabilization).
- The reset manager globally controls all resets in the device. It gathers information from all power domain control blocks to sequence power and clocks, and resets the activation of each domain.
- The clock generator generates and distributes clocks over the device, depending on requests from all module clock controllers and on other global conditions.

### 4.8.2 Sleep Transition

The PRCM can initiate a domain sleep transition on a power domain only if the domain meets the following conditions:

- All initiator modules are idle (they have completed their activity and idled themselves through software requests).
- All target modules are idle (automatically when all initiators are in standby mode or on software request).
- All sleep dependencies with other domains are met (can be set by software).

When the sleep conditions are met (based on the settings of the PRCM.PRM\_PWSTCTRL\_<power domain>[1,0] POWERSTATE bit field), the PRCM performs the actions described in [Table 4-66](#), either automatically or when instructed by the software.

**Table 4-66. Power State Related Sleep Transition Actions**

Power Domain State	Action
ON	All functional and interface clocks in the power domain are shut down when the sleep conditions are met. The power domain is idle and is no longer functional.
RETENTION	The power domain is idle and part or all of the logic and memory of the domain is switched to retention mode.
OFF	The domain is idled and all the logic and memory in the domain are switched off.

The power domain state transition can be set to automatic (hardware controlled) or software-controlled by setting the PRCM. CM\_CLKSTCTRL\_<power domain> CLKTRCTRL\_<power domain> bit field.

### 4.8.3 Wakeup

A wake-up event switches on two domains:

- A power domain (logic and associated memories) that is in INACTIVE state
- A clock domain (including related clock sources, such as a DPLL)

If a domain is already on and the clock domain is idle, only the clocks are reactivated on a wake-up event.

To wake up, a processor requires an interrupt associated with the wake-up event. If its power domain is to transition from OFF or RETENTION state to ACTIVE, it must be reset.

There are three types of wake-up events:

- Global: Generated on a particular device event (device wakeup, voltage transition completed, DPLL recalibration, etc.). Used mainly to wake up the MPU domain
- Module: Functional wake-up event issued from a module, which wakes up the domain where the module resides. It can also directly wake up the MPU or the IVA2.2 processor, depending on software settings in the PRCM.PM\_MPUGRPSEL\_<power domain> and PRCM.PM\_IVA2GRPSEL\_<power domain> registers.
- Dependency: A power domain can wake up on the wakeup of another power domain. The dependency is software-controllable by configuring the PRCM.PM\_WKDEP\_<power domain> register.

#### 4.8.4 Device Wake-Up Events

This section summarizes the wake-up events for each power domain. Table 4-67 through Table 4-77 list the wake-up events, related control registers, and MPU and IVA2.2 interrupts.

Two registers, PRCM.PRM\_IRQENABLE\_MPU and PRCM.PRM\_IRQENABLE\_IVA2, enable the MPU and IVA2.2 interrupts. In some cases, they can also enable the wake-up feature associated with the interrupt (DPLL recalibration requests, voltage controller and processors errors, and device wake-up event).

---

**NOTE:**

- The PRCM can be configured to generate an interrupt to the MPU or the IVA2 subsystem as a result of a wake-up event from the CORE, WKUP, and PER power domain modules to the MPU and the IVA2. However, these modules may also directly interrupt the MPU and the IVA2 subsystems. To avoid a double interrupt (from the PRCM and one of these modules) as the result of a single event (wake-up), one interrupt must be masked when the other is unmasked. For further information on its interrupt capability, see the chapter of the corresponding module.
  - The UART, GPIO, McSPI, and USIM OCP modules generate an asynchronous wake-up event (that is, their interface and functional clocks can be gated during the sleep period). However, because the GPTIMERS generate a synchronous wake-up event, they require their functional clock to be active during the sleep period; their interface clock can be gated. McBSP modules can generate a synchronous or asynchronous wake-up event, based on the mode configurations. For further information on its wake-up capability, see the chapter of the corresponding module.
  - The ability of a module to generate a wake-up event depends on the power state of the power domain in which the module resides. If the power domain is inactive (that is, both the functional and interface clocks of the domain are gated), only the asynchronous wake-up modules can wake up the power domain. If only the interface clocks in the domain are gated, both synchronous and asynchronous wake-up modules can generate a wake-up event to activate the interface clock. Similarly, if the power domain is in RETENTION or OFF power state (that is, the domain logic is nonfunctional), no wake-up event can be generated by any module in that power domain.
-

GPIO1 wakeup	GPIO 1	PM_WKEN_WKUP	Yes	No	N/A

**NOTE:** For the GPIO1 module in the WKUP power domain some of its 32 IO pins are connected to the device IO pads logic in the CORE power domain (VDD2) and the reset to the device IO pads logic in the WKUP power domain (VDD3). As a result when the CORE power domain is OFF, the VDD2 supplied IO pins of the GPIO1 can not generate a wake-up event. For more details, see the *General-Purpose Interface Module* chapter.

## 4.8.5 Sleep and Wake-Up Dependencies

### 4.8.5.1 Sleep Dependencies

The (clock activity) dependencies between power domains are implemented to manage their sleep and wake-up transitions to ensure stable operation of the device.

A power domain sleep transition is achieved when all its clock domains (that is, functional and interface) are gated. For the gating of a clock domain, the following conditions must be satisfied:

- All initiator modules in the clock domain are in standby mode, that is, they cannot initiate any new transitions.
- All target modules in the clock domain are in idle mode and have no pending transitions.
- If the power domain depends on another power domain (that is, has a sleep dependency), the clock domains of the other power domain must be muted.

A clock domain is said to be muted when all its public initiator modules (that is, the initiator modules of the clock domain that can generate interconnect transactions towards targets outside the clock domain) are in standby mode, and the domain cannot initiate new interconnect transactions toward other domains.

Table 4-78 describes the mute conditions for the clock domains.

**Table 4-78. Clock Domain Mute Conditions**

Clock Domain Name	Clock Domain Composition	Mute Conditions
MPU	MPU power domain and MPU INTC in CORE power domain	MPU in stand-by, MPU INTC idle
IVA2	IVA2 power domain and WUGEN in CORE power domain	IVA2.2 in stand-by, WUGEN idle
SGX	SGX power domain	SGX in stand-by
CAM	CAM power domain	CAM in stand-by
DSS	DSS power domain	DSS in stand-by
PER	PER power domain	N/A (No public Initiator)
CORE_L3	L3 interconnect, L3 targets/initiators in CORE power domain	sDMA in standby
CORE_L4	L4 interconnect, L4 targets in CORE power domain	N/A (No public Initiator)
USBHOST	USBHOST power domain	USBHOST in stand-by
WKUP	WKUP power domain	N/A (No public Initiator)

A sleep dependency prevents the PRCM from gating the clocks to a power domain (for sleep transition to inactive, retention or off state from on state) if a dependent power domain is active (i.e., its clocks are active). A power domain may depend on several other power domains.

A power domain sleep dependency is programmed by setting the PRCM.CM\_SLEEPDEP\_<domain> register.

**Example:**

The PER domain has a programmable sleep dependency with the MPU and IVA2 power domains, and a hardwired sleep dependency with the CORE power domain. Therefore, if all software dependencies are enabled, the PER domain can go into idle mode only if the MPU, IVA2, and CORE-L3 clock domains are idle. If all software dependencies are disabled, the PER domain can go into idle mode, provided that the CORE-L3 clock domain is muted (no access to the PER domain can be pending).

[Table 4-79](#) summarizes the programmable and hardwired sleep dependencies among the domains.

**Table 4-79. Sleep Dependencies**

Power Domain	Clock Domain	Sleep Dependency											
		MPU	NEON	IVA2	SGX	CAM	DSS	PER	CORE_L3	CORE_L4	CORE_CM	USB HOST	WKUP

CORE	CORE_L3	1	0	1	1	1	1	1	n/a	1	0	1	1
	CORE_L4	1	0	1	0	0	0	0	1	n/a	0	0	0
	CORE_CM	1	1	1	1	1	1	1	1	1	n/a	1	1
USBHOST	USBHOST	RW	0	RW	0			0	0	0	0	n/a	0
WKUP	WKUP	1	0	1	0	0	0	0	1	0	0	0	n/a

**Notes:**

No software control (hardwired values):	0	Does not depend on
	1	Depends on
Software controllable	RW	Read and write
	n/a	Not applicable

**NOTE:** The first row of the table identifies the dependent power domains for a power domain listed in the first column. Therefore, to identify the sleep dependency of power domain X, identify domain X in the first column and its sleep dependency with power domains (of the first row) is identified by its row.

#### 4.8.5.1.1 CORE Power Domain Sleep Transition Constraint

In addition to the CORE\_L3 and CORE\_L4 clock domains, the CORE power domain contains the CORE\_D2D clock domain. This clock domain provides the SAD2D interface clock and the modem functional clock. It is not used in the stand-alone device, and is only intended for the modem stacked die device configuration. However, the reset values of its control bits force the clock domain to be active after reset, even in the standalone device.

The software must ensure that the CORE\_L3 and CORE\_L4 clock domains are properly controlled, and must also gate the CORE\_D2D clock domain. This is necessary because any sleep request to the CORE power domain is blocked as long as any of its clock domains is active.

The software must take the following steps to properly gate the CORE\_D2D clock domain:

Step	Register Bit Field	Value (Hex)
Disable the SAD2D interface clock.	CM_ICLKEN1_CORE [3] EN_SAD2D	0x0
Configure the automatic hardware supervised clock domain state transition.	CM_CLKSTCTRL_CORE[5:4] CLKTRCTRL_D2D	0x3

The status of the CORE\_D2D clock domain can be read from the CM\_CLKSTST\_CORE[2] CLKACTIVITY\_D2D bit.

#### 4.8.5.2 Wake-Up Dependencies

A wake-up dependency allows a power domain to wake up (from off, retention or inactive state to on state) when another power domain wakes up (from off, retention or inactive state to on state). For example, power domain one (PD1) provides a service to power domain two (PD2), which creates a dependency between the two domains. When the dependent power domain (PD2) wakes up, it signals PD1 with a broadcasted wake-up event, causing PD1 to wake up.

A broadcasted wake-up event can originate from one of two sources:

- PD2 internal wake-up event (typically, a peripheral wake-up event)
- Abortion of the mute mode (at least one initiator in the domain exits standby mode) of PD2 when both the sleep dependency and wake-up dependency with PD1 are enabled.

---

**NOTE:** The domain wake-up dependency is a nontransitive property.

If a power domain PD1 has wake-up dependency with power domain PD2, i.e., PRCM.PM\_WKDEP\_PD1. EN\_PD2 bit is set to 1 and if PD2 has wake-up dependency with power domain PD3, i.e., PRCM.PM\_WKDEP\_PD2. EN\_PD3 bit is set to 1.

However, if PD1 does not have a direct wake-up dependency with PD3, i.e., PRCM.PM\_WKDEP\_PD1. EN\_PD3 bit is set to 0. Then if the PD1 and PD2 are in INACTIVE/RETENTION or OFF power state and PD3 is INACTIVE and is woken-up by a wake-up event, the PD2 is also woken-up but not the PD1.

---

Because a power domain can depend on several other power domains, it can broadcast the wake-up signal to each power domain on which it depends.

A power domain wake-up dependency can either be hardwired (set in the hardware) or programmable through software by configuring the PM\_WKDEP\_<domain> register for that power domain. Continuing the example of PD2 as dependent on PD1, setting the PM\_WKDEP\_PD1.PD2 bit means that when PD2 wakes up, PD1 also wakes up.

The MPU power domain can be wakened only by the IVA2, DSS, USBHOST, PER, CORE-L3, CORE-L4, and WKUP power domains. Similarly, the IVA2 power domain can be wakened only by the MPU, DSS, USBHOST, PER, CORE-L3, CORE-L4, and WKUP power domains. All wake-up dependencies of the MPU and the IVA2 power domain are software-configurable.

For the processor power domains (MPU and the IVA2 power domain), when the wake-up dependency with other power domains is software-programmable (that is, with the USBHOST, PER, CORE, and WKUP power domains), two registers may need be configured: PM\_WKDEP\_<domain> and PM\_<processor>GROUPSEL\_<domain>.

The PM\_WKDEP\_<domain> register serves only to enable/disable the global wake-up dependency of the processor power domain on these three power domains. The PM\_<processor>GROUPSEL\_<domain> register must be configured to enable the particular wake-up event in these domains that will wake up the processor domain. Thus, the global wake-up dependency for a dependent domain must be enabled so that a wake-up event can occur, if it has been enabled in the corresponding GROUPSEL register.

For example, if the wake-up dependency of the MPU power domain is to be enabled for a wake-up event from the GPIO2 module of the PER power domain, the following configuration is required:

- PRCM.PM\_MPUGRPSEL\_PER[13] GRPSEL\_GPIO2
- PRCM.PM\_WKDEP\_MPU[7] EN\_PER

[Table 4-80](#) summarizes the programmable and hardwired wake-up dependencies among the domains.

**Table 4-80. Wake-Up Dependencies**

Power Domain	Clock Domain	Wake-Up Dependency

#### 4.8.6 USBHOST/USBTLL Save-and-Restore Management

Both USBHOST and USBTLL support a save-and-restore mechanism. When the device enters into off mode (that is, all power domains, except the WKUP power domain, are off), the user may want to save the USBHOST context and restore it when exiting off mode. The save-and-restore mechanism for the HS USB Host is enabled by setting the PRCM.PM\_PWSTCTRL\_USBHOST[4] SAVEANDRESTORE bit; for the USBTLL, it is configured by the PRCM.PM\_PWSTCTRL\_CORE[4] SAVEANDRESTORE bit. The save mechanism is initiated as the power domain transitions from ACTIVE to OFF state (or to OSWR state for the USBTLL), whereas the restore mechanism is initiated as the power domain transitions from OFF to ACTIVE power state.

Figure 4-78 shows the generic save-and-restore sequence applicable to both the USBHOST and the USBTLL. The sequence follows:

1. When the PRCM intends to initiate a sleep transition over the power domain (the USBHOST power domain for the HS USB Host subsystem and the CORE power domain for the USBTLL module), it sends a sleep request to the power domain. When the domain modules acknowledge the sleep request, the functional and interface clocks to the modules are gated.
2. The PRCM enables the SAR\_FCLK functional clock and initiates the save sequence for the module. SAR\_FCLK is gated when the save sequence completes.
3. The PRCM switches the power domain state to OFF power state. When a wake-up event occurs, the PRCM switches on the power domain.
4. The power domain local reset is asserted and then released by the reset manager.
5. The PRCM enables the SAR\_FCLK functional clock, and then initiates the restore sequence for the module. SAR\_FCLK is gated when the restore sequence completes.
6. The PRCM enables the functional and interface clocks to the modules and releases the sleep request. The modules acknowledge, and the wake-up sequence completes.

---

**NOTE:**

- The PRCM sleep request and the module acknowledge signals are part of a hardware communication interface to ensure the proper sleep and wake-up sequence.
  - [Figure 4-78](#) shows the save-and-restore sequence. It does not provide the exact timing delays between the switching of the signals and serves only to highlight the sequence of events as they occur.
-

Figure 4-78. Save-and-Restore Sequence

prcm-092

### 4.8.6.1 USBHOST SAR Sequences

#### 4.8.6.1.1 Save Sequence on Sleep Transition

A precondition to the save sequence on sleep transition is that the save-and-restore mechanism is enabled (the PRCM.PM\_PWSTCTRL\_USBHOST[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from ON to OFF power state.

1. When the USBHOST power domain is idled (all clocks of the power domain are gated), the PRM initiates the power domain transition to OFF power state by setting the PRCM.PM\_PWSTCTRL\_USBHOST[1:0] POWERSTATE bit field to 0x0.
2. The PRCM activates USBHOST\_SAR\_FCLK and starts the save sequence.
3. When the save sequence completes, USBHOST\_SAR\_FCLK is gated.
4. The power domain sleep transition to OFF power state completes.

#### 4.8.6.1.2 Restore Sequence on Wake-Up Transition

A precondition to the restore sequence on wake-up transition is that the save-and-restore mechanism is enabled (the PRCM.PM\_PWSTCTRL\_USBHOST[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from OFF to ON power state.

1. PRCM switches the power domain to ON power state.
2. PRCM asserts the USBHOST domain reset. The functional reset is released locally when the functional clocks are back.
3. PRCM releases the USBHOST domain reset.
4. The PRCM activates USBHOST\_SAR\_FCLK and starts the restore sequence.
5. When the restore sequence completes, USBHOST\_SAR\_FCLK is gated.
6. The power domain wake-up transition to ON power state completes.

### 4.8.6.2 USB TLL SAR Sequences

#### 4.8.6.2.1 Save Sequence on Sleep Transition

A precondition to the save sequence on sleep transition is that the save-and-restore mechanism is enabled (the PRCM.PM\_PWSTCTRL\_CORE[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from ON to Open Switch Retention (OSWR) or OFF power state.

1. When the CORE power domain is idled (all clocks of the power domain have been gated) the PRM initiates the power domain transition to OFF or OSWR power state by setting the PRCM.PM\_PWSTCTRL\_CORE[1:0] POWERSTATE bit field to 0x0 or 0x1.
2. The PRCM activates USBTLL\_SAR\_FCLK and starts the save sequence.
3. When the save sequence completes, USBTLL\_SAR\_FCLK is gated.
4. The power domain sleep transition to OFF or OSWR power state completes.

#### 4.8.6.2.2 Restore Sequence on Wake-Up Transition

A precondition to the restore sequence on wake-up transition is that the save-and-restore mechanism is enabled (the PRCM.PM\_PWSTCTRL\_CORE[4] SAVEANDRESTORE bit is set to 1). The sequence is initiated when the power domain switches from OFF or OSWR to ON power state.

1. PRCM switches the power domain to ON power state.
2. Assert CORE domain reset (must override the functional stall conditions of the reset manager). The functional reset is released locally when the functional clocks are back.
3. Release CORE domain reset.
4. The PRCM activates the USBTILL\_SAR\_FCLK and starts the restore sequence.
5. When the restore sequence completes, USBTILL\_SAR\_FCLK is gated.
6. The power domain wake-up transition to ON power state completes.

## 4.9 PRCM Interrupts

Table 4-81 lists the interrupts from the PRCM to the MPU and the IVA2.

**Table 4-81. Interrupt Descriptions**

Interrupt Name	Mapping	Description
PRCM_MPU_IRQ	M_IRQ_11	To MPU interrupt controller (MPU INTC)
PRCM_IVA_IRQ	IVA2_IRQ[12]	To IVA2.2 wake-up controller (IVA2.2 WUGEN)

Table 4-82 and Table 4-83 summarize the event flags (in PRM\_IRQSTATUS\_MPU and PRM\_IRQSTATUS\_IVA2 registers) and mask (in PRM\_IRQENABLE\_MPU and PRM\_IRQENABLE\_IVA2 registers) related to the events generating PRCM interrupts to the MPU and the IVA2.

**Table 4-82. MPU Interrupt Event Descriptions**

Event Flag	Event Mask	Map to	Automatic MPU Domain Wake-Up Event	Description
PRM_IRQSTATUS_MPU[0] WKUP_ST	PRM_IRQENABLE_MPU[0] WKUP_EN	PRCM_MPU_IRQ	No	MPU peripheral group wakeup
PRM_IRQSTATUS_MPU[2] EVGENON_ST	PRM_IRQENABLE_MPU[2] EVGENON_EN	PRCM_MPU_IRQ	No	Event generator end of on time
PRM_IRQSTATUS_MPU[3] EVGENOFF_ST	PRM_IRQENABLE_MPU[3] EVGENOFF_EN	PRCM_MPU_IRQ	No	Event generator end of off time
PRM_IRQSTATUS_MPU[4] TRANSITION_ST	PRM_IRQENABLE_MPU[4] TRANSITION_EN	PRCM_MPU_IRQ	No	A sleep or wake-up transition completion event for IVA2, NEON, SGX, DSS, CAM, PER, EMU, USBHOST power domains
PRM_IRQSTATUS_MPU[5] CORE_DPLL_ST	PRM_IRQENABLE_MPU[5] CORE_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL3 recalibration event
PRM_IRQSTATUS_MPU[6] PERIPH_DPLL_ST	PRM_IRQENABLE_MPU[6] PERIPH_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL4 recalibration event
PRM_IRQSTATUS_MPU[7] MPU_DPLL_ST	PRM_IRQENABLE_MPU[7] MPU_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL2 recalibration event
PRM_IRQSTATUS_MPU[8] IVA2_DPLL_ST	PRM_IRQENABLE_MPU[8] IVA2_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL1 recalibration event
PRM_IRQSTATUS_MPU[9] IO_ST	PRM_IRQENABLE_MPU[9] IO_EN	PRCM_MPU_IRQ	No	I/O pads wake-up event
PRM_IRQSTATUS_MPU[10] VP1_OPPCHANGEDONE_ST	PRM_IRQENABLE_MPU[10] VP1_OPPCHANGEDONE_EN	PRCM_MPU_IRQ	No	Voltage processor 1 OPP Change Done event.
PRM_IRQSTATUS_MPU[11] VP1_MINVDD_ST	PRM_IRQENABLE_MPU[11] VP1_MINVDD_EN	PRCM_MPU_IRQ	No	Voltage processor 1 new voltage reached the minimum voltage value allowed.
PRM_IRQSTATUS_MPU[12] VP1_MAXVDD_ST	PRM_IRQENABLE_MPU[12] VP1_MAXVDD_EN	PRCM_MPU_IRQ	No	Voltage processor 1 new voltage reached the maximum voltage value allowed.
PRM_IRQSTATUS_MPU[13] VP1_NOSMPSACK_ST	PRM_IRQENABLE_MPU[13] VP1_NOSMPSACK_EN	PRCM_MPU_IRQ	No	Voltage processor 1 time-out occurred while waiting for the power IC device acknowledge.
PRM_IRQSTATUS_MPU[14] VP1_EQVALUE_ST	PRM_IRQENABLE_MPU[14] VP1_EQVALUE_EN	PRCM_MPU_IRQ	No	Voltage processor 1 new voltage is the same as the current voltage.

**Table 4-82. MPU Interrupt Event Descriptions (continued)**

Event Flag	Event Mask	Map to	Automatic MPU Domain Wake-Up Event	Description
PRM_IRQSTATUS_MPU[15] VP1_TRANXDONE_ST	PRM_IRQENABLE_MPU[15] VP1_TRANXDONE_EN	PRCM_MPU_IRQ	No	Voltage processor 1 transaction is complete.
PRM_IRQSTATUS_MPU[16] VP2_OPPCHANGEDONE_ST	PRM_IRQENABLE_MPU[16] VP2_OPPCHANGEDONE_EN	PRCM_MPU_IRQ	No	Voltage processor 2 OPP Change Done event.
PRM_IRQSTATUS_MPU[17] VP2_MINVDD_ST	PRM_IRQENABLE_MPU[17] VP2_MINVDD_EN	PRCM_MPU_IRQ	No	Voltage processor 2 new voltage reached the minimum voltage value allowed.
PRM_IRQSTATUS_MPU[18] VP2_MAXVDD_ST	PRM_IRQENABLE_MPU[18] VP2_MAXVDD_EN	PRCM_MPU_IRQ	No	Voltage processor 2 new voltage reached the maximum voltage value allowed.
PRM_IRQSTATUS_MPU[19] VP2_NOSMPSACK_ST	PRM_IRQENABLE_MPU[19] VP2_NOSMPSACK_EN	PRCM_MPU_IRQ	No	Voltage processor 2 time-out occurred while waiting for the power IC device acknowledge.
PRM_IRQSTATUS_MPU[20] VP2_EQVALUE_ST	PRM_IRQENABLE_MPU[20] VP2_EQVALUE_EN	PRCM_MPU_IRQ	No	Voltage processor 2 new voltage is the same as the current voltage.
PRM_IRQSTATUS_MPU[21] VP2_TRANXDONE_ST	PRM_IRQENABLE_MPU[21] VP2_TRANXDONE_EN	PRCM_MPU_IRQ	No	Voltage processor 2 transaction is done.
PRM_IRQSTATUS_MPU[22] VC_SAERR_ST	PRM_IRQENABLE_MPU[22] VC_SAERR_EN	PRCM_MPU_IRQ	Yes	Slave address in an I <sup>2</sup> C frame sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[23] VC_RAERR_ST	PRM_IRQENABLE_MPU[23] VC_RAERR_EN	PRCM_MPU_IRQ	Yes	Register address in an I <sup>2</sup> C frame sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[24] VC_TIMEOUTERR_ST	PRM_IRQENABLE_MPU[24] VC_TIMEOUTERR_EN	PRCM_MPU_IRQ	Yes	Last byte of an I <sup>2</sup> C frame issued from the bypass port or from the voltage manager FSM ports sent by the voltage controller not acknowledged by the power IC device
PRM_IRQSTATUS_MPU[25] SND_PERIPH_DPLL_RECAL_ST	PRM_IRQENABLE_MPU[25] SND_PERIPH_DPLL_RECAL_EN	PRCM_MPU_IRQ	Yes	DPLL5 recalibration event

**NOTE:** TRANXDONE and OPPCHANGEDONE interrupt events are generated under the same conditions (after voltage change).

**Table 4-83. IVA2 Interrupt Event Descriptions**

Event Flag	Event Mask	Map to	IVA2 Domain Wake-Up Event	Description
PRM_IRQSTATUS_IVA2[0] WKUP_ST	PRM_IRQENABLE_IVA2[0] WKUP_EN	PRCM_IVA_IRQ	No	IVA2 peripheral group wakeup
PRM_IRQSTATUS_IVA2[1] FORCEWKUP_ST	PRM_IRQENABLE_IVA2[1] FORCEWKUP_EN	PRCM_IVA_IRQ	No	IVA2 power domain forced wake-up transition completion
PRM_IRQSTATUS_IVA2[2] IVA2_DPLL_ST	PRM_IRQENABLE_IVA2[2] IVA2_DPLL_RECAL_EN	PRCM_IVA_IRQ	Yes	DPLL2 recalibration required

**NOTE:** The software must first read the event flag to know the interrupt cause, and then write 1 to it to clear the flag.

### 4.10 PRCM Voltage Management Functional Description

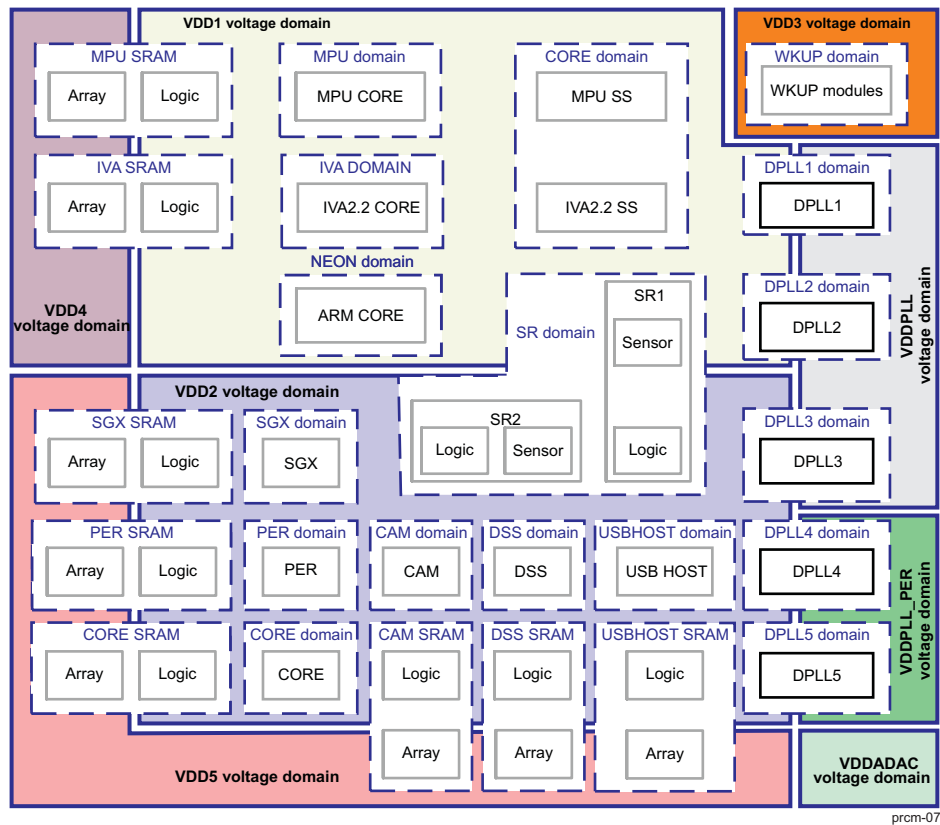

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

**NOTE:** For more information regarding the device power pads connection, please refer to your device-specific data manual.

#### 4.10.1 Overview

Figure 4-79 is an overview of the device voltage domains.

**Figure 4-79. Overview of Device Voltage Domains**

prcm-073

The device is split into voltage domains:

- Three voltage domains for the logic (VDD1, VDD2, and VDD3)
- Two voltage domains for memory (VDD4 and VDD5)
- Two voltage domains for PLLs and analog cells (VDDPLL and VDDPLL\_PER)
- Voltage domain for the I/Os

This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. Functionally, however, voltage control of a voltage domain may depend on the voltage level of another voltage domain; for example, VDD1 voltage-level control may depend on the VDD2 voltage level. Figure 4-79 shows the voltage dependency between domains.

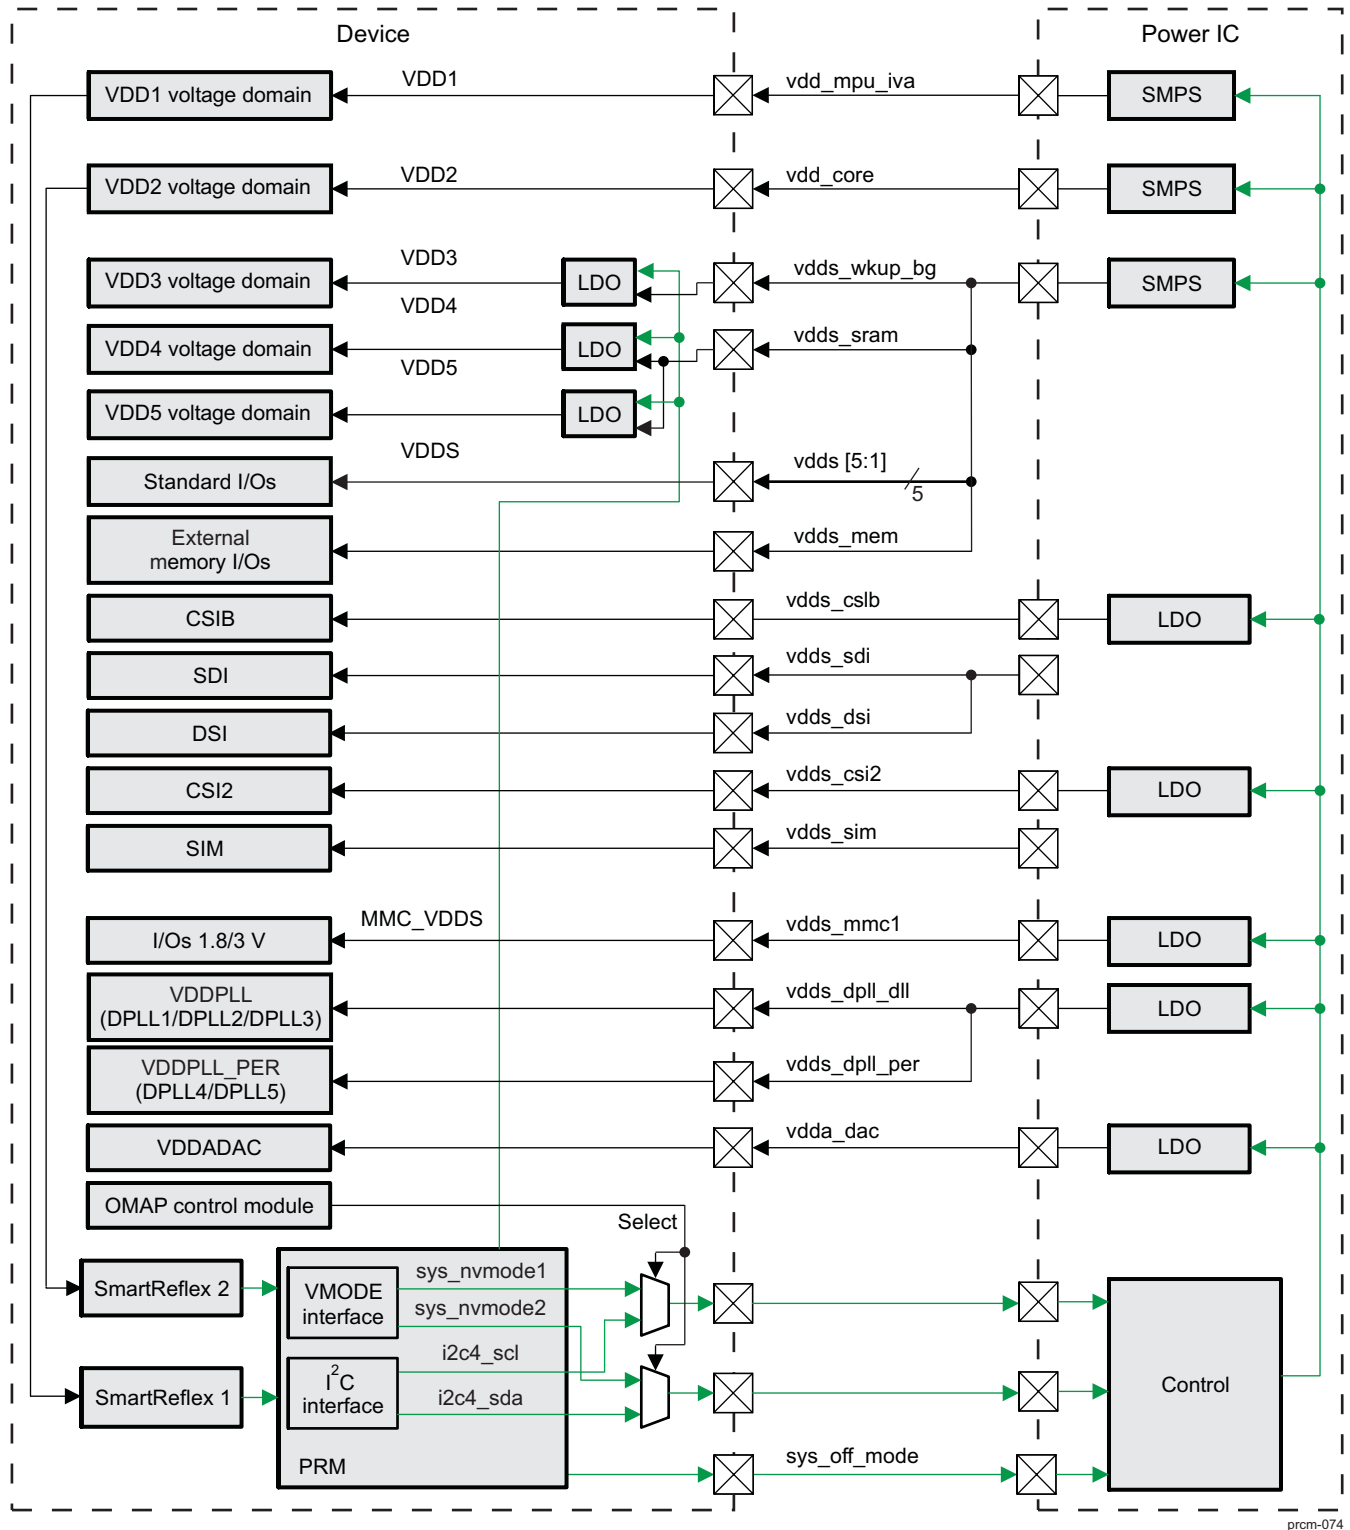

Figure 4-80 is an overview of the device voltage sources and their controls. The PRM directly manages the following voltage sources:

- VDD1: Processor voltage
- VDD2: CORE voltage
- VDD3: Wake-up voltage
- VDD4: Processor SRAM voltage
- VDD5: CORE SRAM voltage

The remaining voltage sources (VDDS, VDDPLL, and MMC-VDDS) are either controlled directly by the external device or software-controlled through an I<sup>2</sup>C interface independent of the PRM. Figure 4-80 is an overview of the PRCM voltage-control.

Figure 4-80. Overview of Device Voltage Distribution

prcm-074

**NOTE:** Memory I/Os (1.8 V) are not supplied with the other I/Os. They come directly from the power IC.

## 4.10.2 Voltage Domains

Table 4-84 summarizes, for each voltage domain, the voltage level corresponding to its OPP when its power domains are on and the voltage level when its power domains are in RETENTION or OFF power state. Please refer to your device-specific data manual for details.

**Table 4-84. Voltage Domain Controls Summary**

Voltage Domain (Power Rail)	Operating Point	Control	Supplied Modules
VDD1 (vdd_mpu_iva)	Off	HW and SW	MPU subsystem, IVA2.2 subsystem, digital part of DPLL1 and DPLL2, SmartReflex1
	Retention		
	OPP1		
	OPP2		
	OPP3		
	OPP4		
VDD2 (vdd_core)	Off	HW and SW	Most modules, interconnects, peripherals. SmartReflex2, digital part of DPLL3, DPLL4, and DPLL5
	Retention		
	OPP1		
	OPP2		
	OPP3		
VDD3 (vdds_wkup_bg)	Low-power mode	HW	WKUP, Bandgap, and EMU domains
	Normal mode		
	Emulation mode		
VDD4 (vdds_sram)	All memories off	HW	Processor memories
	All memories in retention		
	VDD1 is in OPP1, OPP2, or OPP3		
	VDD1 in OPP4 or OPP5		
VDD5 (vdds_sram)	Off	HW	CORE, SGX, CAM, DSS, PER, USBHOST and EMU memories
	Retention		
	VDD2 is in OPP1, OPP2, or OPP3		
VDDS (vdds)	Always-on	None	I/Os
VDDADAC (vdda_dac)	Software-driven only <sup>(1)</sup>	SW	Video DAC
VDDPLL (vdds_dpil_dll)	Always-on <sup>(1)</sup>	None	Analog part of DPLL1, DPLL2, and DPLL3
VDDPLL_PER (vdds_dpil_per)	Always-on <sup>(1)</sup>	None	Analog part of DPLL4 and DPLL5
External Memory I/Os (vdss_mem)	Always-on	None	External Memory I/Os
SIM (vdds_sim)	Always-on <sup>(1)</sup>	None	SIM
MMC_VDDS (vdds_mmc1)	Always-on <sup>(1)</sup>	None	MMC1

<sup>(1)</sup> Identifies the voltage domains. Can be switched to 0.0 V when the interface/ module is not in use.

**NOTE:**

- Logic retention (RFFs and some memory registers OSWR) is implemented only for parts of the CORE power domain. Full device logic retention is also feasible by keeping all power domains on and lowering VDD1 and VDD2 to minimum OPP (CSWR). This consumes more power than the first option, but allows for a fast restart.
- When the user programs all memories in retention, VDD4 and VDD5 are automatically set to RETENTION voltage level by the PRM, which allows the memory arrays to be retained.

### 4.10.3 Voltage Domains Dependencies

Table 4-85 and Table 4-86 summarize the hardware conditions and the software setting required to switch the VDD1 and VDD2 to their respective low-power states.

**Table 4-85. VDD1 Voltage Domain Dependencies**

VDD1 Domain State	Power Domains State	DPLL State	sys_clk	Software Control <sup>(1)</sup>	VDD2	VDD3	VDD4	VDD5
SLEEP	Software controlled power domains of VDD1 are in INACTIVE, RETENTION or OFF state.	DPLL1 and DPLL2 are in Stop mode	n/a	AUTO_SLEEP = 1 AUTO_RET = 0 AUTO_OFF = 0	ON or SLEEP	ON or Overdriven	ON or RETENTION	ON or RETENTION
RETENTION	Software controlled power domains of VDD1 are in RETENTION or OFF state and of VDD2 are in INACTIVE, RETENTION or OFF state	DPLL1 and DPLL2 are in Stop mode	n/a	AUTO_SLEEP = 0 AUTO_RET = 1 AUTO_OFF = 0	ON or RETENTION	ON or Overdriven	RETENTION	ON or RETENTION
OFF	Software controllable power domains of VDD1 and VDD2 are in OFF state.	All DPLLs are in Stop mode	not required anymore	AUTO_SLEEP = 0 AUTO_RET = 0 AUTO_OFF = 1	OFF	SLEEP	OFF	OFF

<sup>(1)</sup> It is mandatory to program the three bit fields AUTO\_SLEEP, AUTO\_RET, and AUTO\_OFF in an exclusive manner.

**Table 4-86. VDD2 Voltage Domain Dependencies**

VDD2 Domain State	Power Domains State	DPLL State	sys_clk	Software Control	VDD1	VDD3	VDD4	VDD5
SLEEP	Software controlled power domains of VDD1 and VDD2 are in INACTIVE, RETENTION or OFF state	All DPLLs are in Stop mode	not required anymore	AUTO_SLEEP = 1 AUTO_RET = 0 AUTO_OFF = 0	SLEEP	ON or Overdriven	ON or RETENTION	ON or RETENTION

**Table 4-86. VDD2 Voltage Domain Dependencies (continued)**

VDD2 Domain State	Power Domains State	DPLL State	sys_clk	Software Control	VDD1	VDD3	VDD4	VDD5
RETENTION	Software controlled power domains of VDD1 are in INACTIVE, RETENTION or OFF state and of VDD2 are in RETENTION or OFF state	All DPLLs are in Stop mode	not required anymore	AUTO_SLEEP = 0 AUTO_RET = 1 AUTO_OFF = 0	ON or RETENTION	ON or Overdriven	ON or RETENTION	RETENTION
OFF	Software controllable power domains of VDD1 and VDD2 are in OFF state.	All DPLLs are in Stop mode	not required anymore	AUTO_SLEEP = 0 AUTO_RET = 0 AUTO_OFF = 1	OFF	SLEEP	OFF	OFF

**NOTE:**

- In voltage domain SLEEP state the current load decreases because of reduced activity level, however the voltage level remains that of ON state.
- In voltage domain overdriven state the domain voltage is raised above the nominal operating voltage to boost performance, however power consumption increases also.
- The AUTO\_SLEEP, AUTO\_RET and AUTO\_OFF, in the Software Control column, refers to the PRM\_VOLTCTRL[0] AUTO\_SLEEP, PRM\_VOLTCTRL[1] AUTO\_RET and PRM\_VOLTCTRL[2] AUTO\_OFF bits.

**Table 4-87. Remaining Voltage Domain Dependencies**

Voltage	Condition
VDDS	No dependency with other device voltages
External Memory I/Os	
VDDADAC	
VDDPLL	
VDDPLL_PER	
SIM	
MMC_VDDS	

#### 4.10.4 Voltage-Control Architecture

The PRM is split over several blocks that manage the different voltage sources.

- VDD1 and VDD2 voltages are managed by multiple control sources:
  - Automatic voltage adjustment (for optimal performance at an OPP) and software-requested voltage scaling (for OPP change) are managed by two SmartReflex voltage control modules connected to two voltage processor modules. They generate voltage-adjustment commands based on the desired and current performance levels of the device. These commands are sent to the external power IC through a voltage controller and a dedicated I<sup>2</sup>C interface.
  - Direct software control of VDD1 and VDD2 is also possible by writing to the registers of the voltage controller, which then sends the voltage commands to the power IC through the dedicated I<sup>2</sup>C interface.
  - Two voltage finite state-machines (FSM 1 and FSM 2) can also manage the VDD1 and VDD2

voltages either by sending commands to the voltage controller (I<sup>2</sup>C mode) or by sending the sys\_nvmode1 and sys\_nvmode2 control signals (direct-control mode). The FSMs control voltage-level switching, based on the power state of the device.

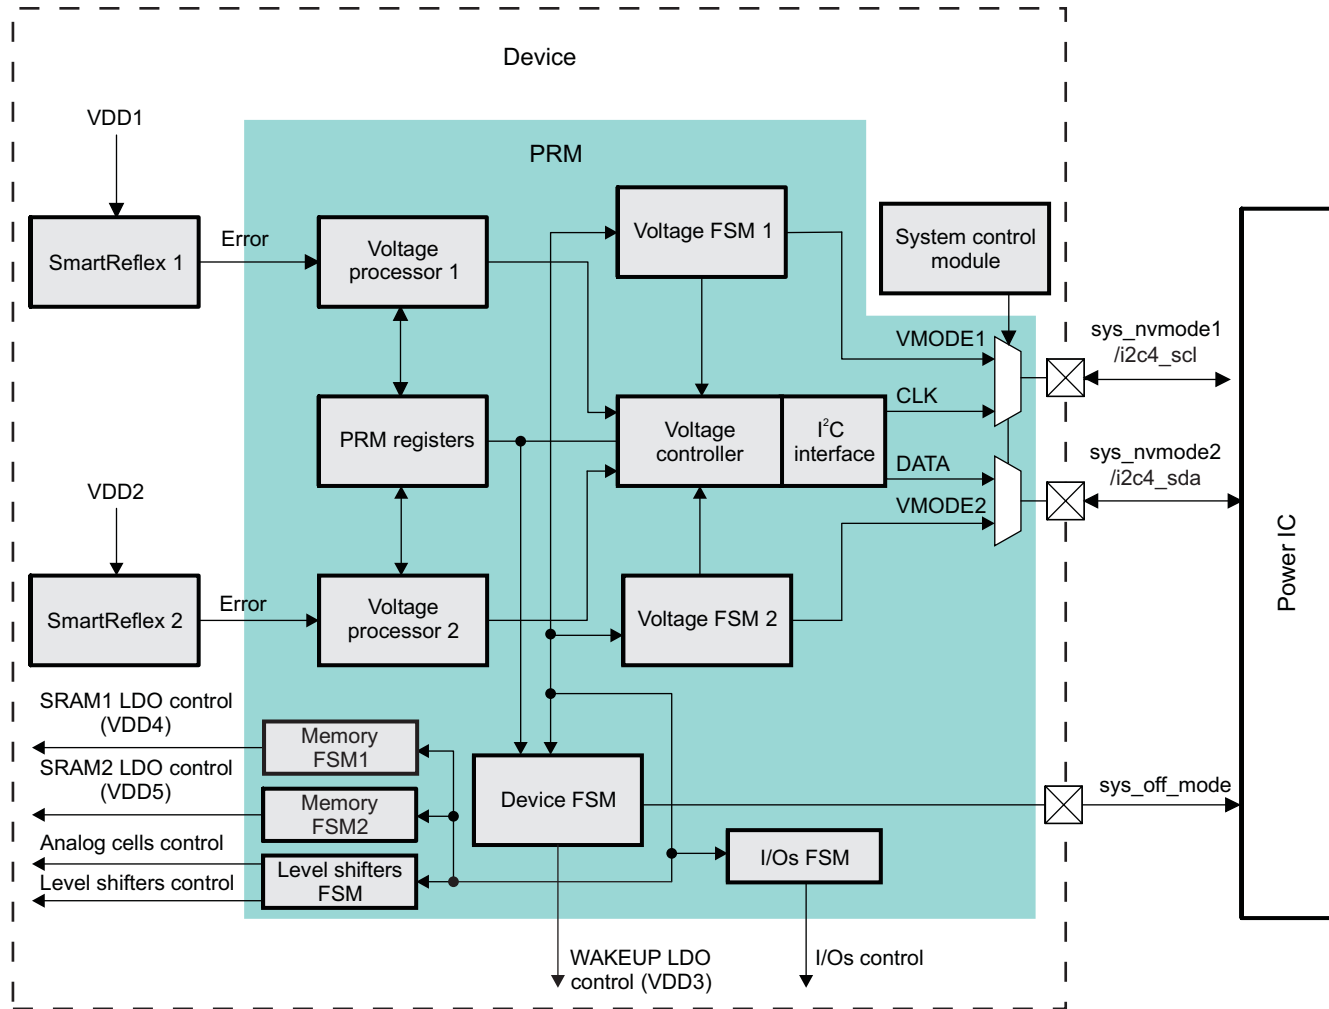

- The FSMs in the PRM also control SRAM and wake-up LDOs, sleep mode for analog cells, and level shifters.
- A device FSM sequences the memory, wakeup, voltage, and I/O FSMs during the device off, sleep, and wake-up transitions.

---

**NOTE:** The SmartReflex module allows dynamic voltage adjustments around an OPP voltage level to ensure target performance. It also allows switching from one OPP to another. However, it does not control voltage switching to RETENTION or OFF as the power domains or the device change power states. This is handled by the voltage FSMs.

---

Figure 4-81 shows the architecture for PRM voltage control.

**Figure 4-81. PRCM Voltage Control Architecture**

\* The colored region in the figure represents the boundary of the PRCM.

prcm-075

### CAUTION

It is highly recommended to use the embedded dedicated I2C4 instead of VMODE, which is a legacy mode. The I2C4 provides greater flexibility and higher efficiency in terms of power optimization.

#### 4.10.5 VDD1 and VDD2 Control

The main power-supply sources, VDD1 and VDD2, can be controlled using mutually exclusive modes specified in the SCM:

- Direct control With VMODE Signals or I2C Interface
- Dedicated SmartReflex I<sup>2</sup>C control

Because both control modes are multiplexed on the same device pins, direct control signals can be used alternately with I<sup>2</sup>C control signals. The muxes are managed by the SCM.

#### 4.10.5.1 Direct Control with VMODE Signals

In direct-control mode, the VDD1 and VDD2 voltage sources can be controlled by the voltage FSMs in the PRM to trigger a voltage transition based on the power domain states. The voltage FSMs use a VMODE interface to send voltage commands through the `sys_nvmode1` and `sys_nvmode2` pins of the device to the external power IC. The simple voltage-control commands of the VMODE interface can be used to set two voltage values (VDD1 and VDD2) per voltage domain .

The `sys_nvmode[1,2]` signals request new voltage levels to the external SMPS. The polarity of the `sys_nvmode[1,2]` signals from the PRM is configured by the `PRCM.PRM_POLCTRL[0] EXTVOL_POL` bit, which is active-low by default. When the signal goes low, a lower voltage is supplied, and when it goes high, a higher voltage is supplied.

The VMODE voltage control is enabled by setting the `PRM.PRM_VOLTCTRL[4] SEL_VMODE` bit, and is triggered when the device switches between low-power (retention or off) mode and normal (on) mode.

Figure 4-82 is an example of a VDD2 voltage transition from an operational voltage at 1.15 V (OPP3) to the lowest functional voltage of the device (0.9 V). In this example, the PRCM is programmed to automatically lower `sys_nvmode2` when the device enters sleep mode. The power IC is programmed to ramp the VDD2 voltage down to 0.9 V when `sys_nvmode2` is de-asserted and to ramp up the voltage to 1.15 V when `sys_nvmode2` is asserted. The PRCM must also wait for the VDD2 regulator to stabilize when `sys_nvmode2` is de-asserted and asserted. This stabilization time is programmable by software using the `PRCM.PRM_VOLTSETUP1` register.

Figure 4-82. Voltage Transition Controlled by `sys_nvmode2`

prcm-076

Internally, the PRM manipulates two logical voltage levels (L0 and L1) for each `sys_nvmode[1,2]` signal. One level is set when all the power domains in the voltage domain are in retention or off mode, while the other is set when a power domain is on. The power IC must be configured to switch to low voltage when the associated `sys_nvmode[1,2]` signal is received, and vice versa.

For example, if L0 is the lower voltage and an active-low polarity (default setting) on the `sys_nvmode[1,2]` signal:

- L0 logical level `sys_nvmode[1,2] = 1` VDD = 1.15 V
- L1 logical level `sys_nvmode[1,2] = 0` VDD = 0.9 V

The polarity of the logical voltage-level signal from the PRM can be controlled by the `PRCM.PRM_POLCTRL[0] EXTVOL_POL` bit. It is active-low by default (L0 = 1, L1 = 0).

#### 4.10.5.2 Direct Voltage Control with I<sup>2</sup>C Interface

PRM can send VDD1 and VDD2 sleep commands to the power IC via the dedicated I2C. This allows the power IC to activate sleep mode (the voltage regulator switches in sleep mode, where voltage is maintained but only small load is supported). This allows external Power IC reducing its power consumption as well.

#### 4.10.5.3 Voltage Controller and Dedicated SmartReflex I<sup>2</sup>C Interface

The dedicated I<sup>2</sup>C voltage control mode is dedicated to SmartReflex technology. The central modules for the I<sup>2</sup>C control mode are the voltage controller and the I<sup>2</sup>C interface. The voltage controller receives voltage control commands from five input ports:

- Voltage processor 1 and 2 ports: The voltage processors send commands to the voltage controller depending on the SmartReflex module calculations (during device activity).
- Voltage FSM 1 and 2 ports: The voltage FSMs send commands to the voltage controller when the device enters RETENTION or OFF power state, and also when the device wakes up.
- PRM register port: The PRM registers give direct software control over the voltage levels of the VDD1 and VDD2 voltage domains.

An arbitration scheme in the voltage controller manages concurrent requests on multiple ports.

Externally, the voltage controller interfaces to a power IC through a dedicated I<sup>2</sup>C interface (I2C4). To reduce the latency of voltage changes, the voltage controller is configurable to run in HS I<sup>2</sup>C mode.

Each internal port has a handshake to indicate when the I<sup>2</sup>C frame that results from the request on that port is acknowledged by the external power IC.

#### 4.10.5.4 SmartReflex Voltage Control

As explained previously (see [Section 4.1.2.2, SmartReflex Adaptive Voltage Control](#)), SmartReflex technology uses adaptive power control to reduce active power consumption by the device. SmartReflex voltage control in the device is based on the dedicated SmartReflex modules and the voltage processors, in addition to the voltage controller and I<sup>2</sup>C interface, which are shared with the voltage FSMs and voltage control registers.

The SmartReflex modules allow a continuous real-time voltage supply and device performance monitoring to do the following:

- Minimize the supply voltage to reduce the device power consumption.
- Maintain the desired device performance (by dynamically adjusting the device voltage) as the temperature of the device varies.

Within the device, the SmartReflex modules can be used to stabilize performance at a given OPP or for the DVFS (that is, switching from one OPP to another).

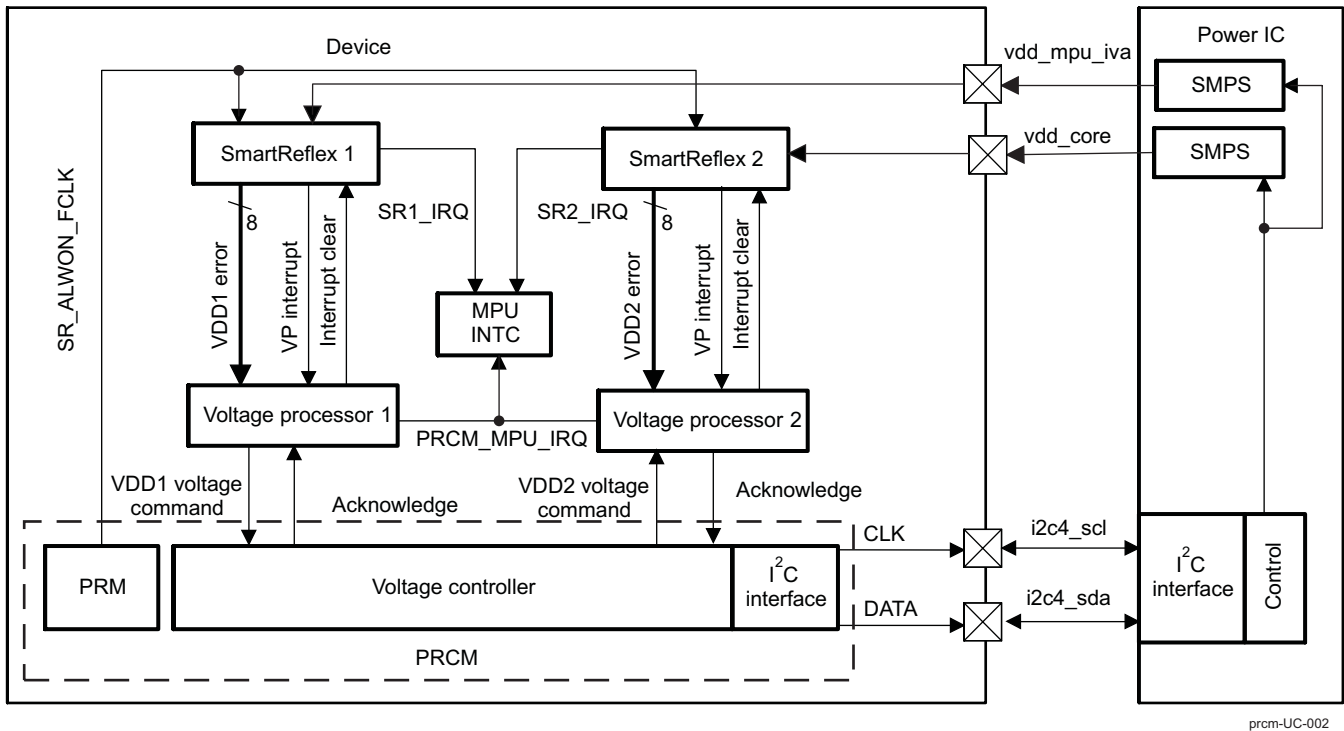

Because the SmartReflex modules and the voltage processors are dedicated to SmartReflex voltage control, they are described together in this section.

#### 4.10.5.4.1 SmartReflex in the Device

Figure 4-83 shows the SmartReflex integration.

Figure 4-83. SmartReflex Integration

prcm-UC-002

SmartReflex voltage control in the device is implemented for simultaneous control of two independent voltage sources. One SmartReflex module controls the VDD1 voltage, while the second one is dedicated to VDD2 control. Each SmartReflex module is connected to a voltage processor. Voltage commands from both voltage processors are passed to a voltage control, which sends them through a dedicated I<sup>2</sup>C master interface to the power IC.

#### 4.10.6 Analog Cells, LDOs, and Level Shifter Controls

In addition to the VDD1 and VDD2 voltage controls, the PRM handles the following operations automatically, based on hardware conditions, without any software control:

- Reduces SRAM LDOs voltage when all memories are in retention
- Reduces wake-up LDO voltage when the device enters off mode (wake-up leakage reduction)
- Increases wake-up LDO voltage when emulation trace is active
- Actively isolates level shifters during VDD1 and VDD2 removal
- Activates sleep mode in all analog cells when the device enters off mode

##### 4.10.6.1 SRAM Voltage Control

The two embedded SRAM LDOs supply regulated voltage (VDD4 or VDD5) to memory banks. The processor memory LDO (VDD4) has three reference voltages, while the CORE memory LDO (VDD5) supports two:

- 1.2 V is the normal voltage reference, used for processors OPP1, OPP2, and OPP3.
- Tracking between 1.2 V and 1.35 V: The processor SRAM LDO (VDD4) tracks and follows VDD1 voltage when it exceeds OPP3 (1.2 V) nominal voltage. VDD1 (up to 1.35 V) is the overdrive voltage reference when processors operate at OPP4 and OPP5. This option is not supported by the LDO (VDD5) of the CORE memory.
- 1.0 V is set when all memory banks belonging to the LDO are in RETENTION state. This allows

reducing the memory arrays to 0.6 V to minimize leakage.

When not used (all memories are off), the LDO is shut down. These modes are managed automatically by hardware (PRM).

#### 4.10.6.2 Wake-Up and Emulation Voltage Control

The embedded wake-up LDO (VDD3) supplies both WKUP and EMU power domains. It is permanently active and feeds the WKUP power domain continuously. An embedded switch allows the PRM to control power to the EMU power domain. This switch is closed on a software request command when a debug session starts, or automatically on JTAG plug detection.

This LDO has three reference voltages:

- 1.2 V is the normal voltage reference, used in device active mode.
- 1.35 V is the overdrive voltage reference used when emulation is activated and MPU emulation trace is required.
- 1.0 V is set when the device is in low-power (off) mode, to minimize leakage.

These modes are managed automatically by hardware.

## 4.11 PRCM Off-Mode Management

### 4.11.1 Overview

The CORE power domain can be switched from ON to OFF or RETENTION state.

Refer to [Section 4.8.5.1.1](#), *CORE Power Domain Sleep Transition Constraint*, for information.

When the CORE power domain is INACTIVE, the clock manager does not generate an interface clock, and device interconnects are inactive; therefore, the device is effectively in off mode. In RETENTION state, however, the logic in the CORE domain is retained, and the device wake-up latency is small compared to the latency when the CORE power domain is in OFF state. In waking from the CORE domain OFF state, the CORE logic configuration must be loaded from a scratchpad memory in the WKUP power domain.

---

**NOTE:** Although some modules in the device can be kept active while the CORE power domain is OFF or in RETENTION, this is not recommended.

---

When the device is put in off mode (the CORE power domain is in RETENTION or OFF state), the device voltage domains can be switched off to minimize leakage currents. However, reactivity to wake-up events must be ensured.

The device supports a unique off-mode management scheme that allows deactivation of all modules, isolation of their outputs, and configuration of a dedicated off mode on the I/O pads of the device, to listen to wake-up events. A wake-up event on any I/O pad is detected by the PRM (in WKUP always-on power domain), which can then wake up the device.

### 4.11.2 Device Off-Mode Configuration

Any I/O pad of the device can be configured to generate a wake-up event when the device is in off mode. The off-mode scheme is based on the following components of the device:

- I/O pads
- SCM

[Figure 4-84](#) is an overview of the I/O pad off-mode scheme. In this mode, the I/O pads of the device form a daisy chain. The I/O pad logic at the two ends of the chain is connected to the PRM.

When a wake-up event (WUEVT) occurs on an enabled I/O pad in the chain, the event is propagated through the chain to the PRM. Multiple I/O pads can receive a wake-up event simultaneously; however, the PRM receives only the OR output for all the enabled I/O pads. When the device wakes up, the MPU can determine all sources of the current wake-up event logged into the corresponding CONTROL.CONTROL\_PADCONF\_<IOPad>[15] WAKEUPEVENT0 or CONTROL.CONTROL\_PADCONF\_<IOPad> [31] WAKEUPEVENT1 bits in the SCM.

The I/O pad wake-up scheme must be enabled globally by setting the PM\_WKEN\_WKUP[8] EN\_IO bit. The wake-up event from each I/O pad of the device can be individually enabled/disabled (EVT\_EN signal) by writing to the CONTROL.CONTROL\_PADCONF\_<IOPad>[14] WAKEUPENABLE0 or CONTROL.CONTROL\_PADCONF\_<IOPad> [30] WAKEUPENABLE1 bits in the SCM.

For information about the SCM, see the *System Control Module* chapter.

---

**NOTE:** As explained previously (see [Section 4.8](#), *Idle and Wake-Up Management*), module-specific wake-up events other than the I/O pad wake-up scheme can wake up the device from off mode. For example, the GPIO pads in the WKUP power domain can also wake up the device.

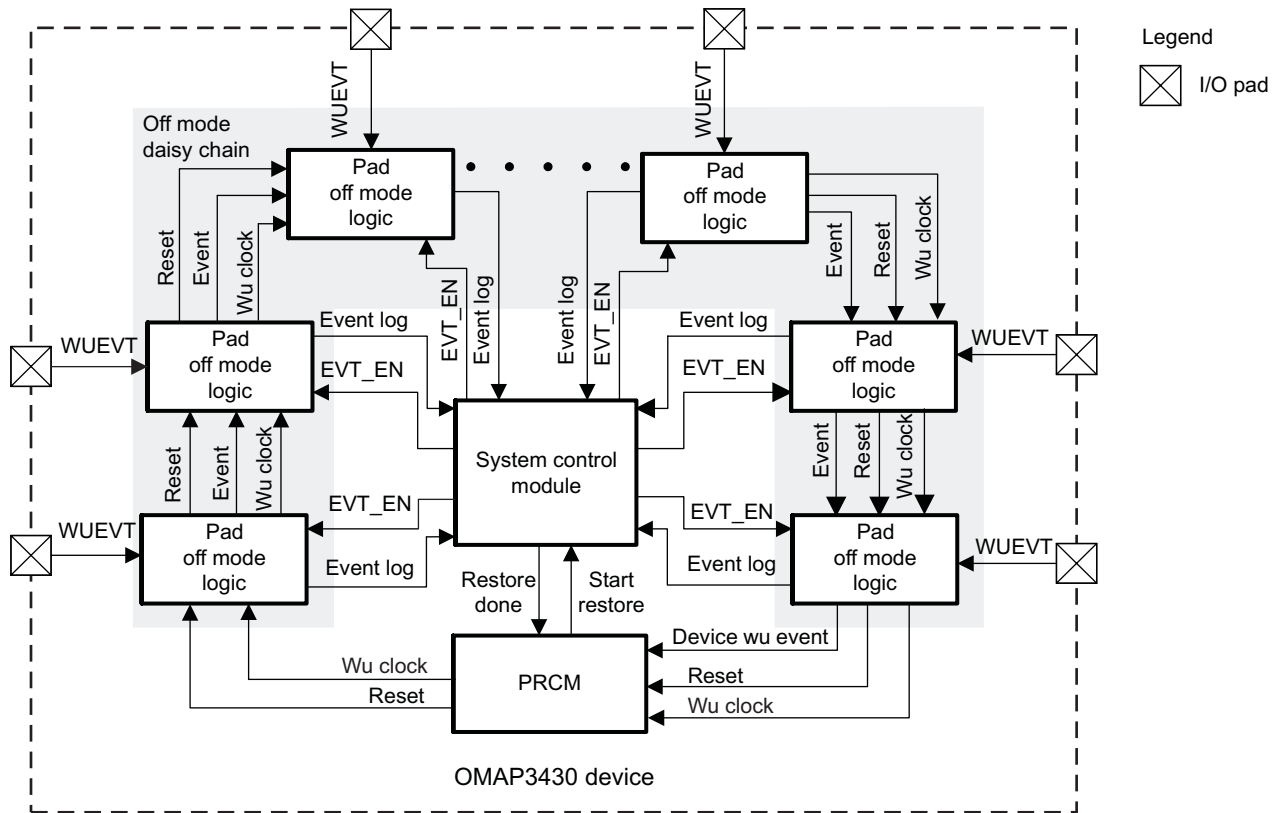

---

---

**NOTE:** For the wake-up features of the GPIO pads, see Chapter 25, *General-Purpose Interface*.

---

**Figure 4-84. Device Off-Mode Control Overview**

prcm-077

### 4.11.3 CORE Power Domain OFF-Mode Sequences

The off-mode I/O pad configuration can be activated to detect wake-up events when the CORE power domain is switched to RETENTION or OFF state. The OFF state sequences for the CORE power domain include the sequence for going from ON state to RETENTION or OFF power state (while enabling the off-mode I/O pad configuration), and then switching back to the ON power state (while disabling the off-mode I/O pad configuration) on a wake-up event.

#### 4.11.3.1 Sleep Sequences (Transition From ON to RETENTION/OFF)

When the CORE power domain is in RETENTION state, the logic is switched off, its context is saved by the RFFs in the modules, and the memory blocks are retained. In OFF state, however, the logic and memories are switched off, and the RFFs are not saved.

**NOTE:** If the PER power domain is kept ON, while CORE power domain is in RETENTION state, all I/O wake-up enable (EVT\_EN signals) signals to the I/O pads related to the PER power domain inputs must be disabled (by clearing the CONTROL.CONTROL\_PADCONF\_<IOpad>[14] WAKEUPENABLE bit in the SCM). In that case, wake-up events are generated by the PER domain and not through the daisy chain.

For information about the SCM, see the *System Control Module* chapter.

The following sequence is used to go from ON to RETENTION or OFF state:

1. The software sets the PRCM.PM\_WKEN\_WKUP[8] EN\_IO bit to enable the I/O pad wake-up scheme.
2. The MPU initiates the sleep sequence. When all conditions are met, the CORE power domain clocks are shut down. At this stage, most of the pads are inactive, but some, such as the PER and DSS power domains, can stay active.

3. The PRM initializes and resets the I/O wake-up detection scheme and saves all RFFs. Its CORE power domain output is isolated from the I/O pads.
4. The PRM switches the CORE power domain to retention/off power state. I/O configuration is saved on wake up power domain registers, see the *Save-and-Restore Mechanism* section of the *System Control Module* chapter for more information.
5. The PRM waits for a wake-up event from the daisy chain. Other possible wake-up sources can be a wake-up event from a module in the wake-up power domain or from a global warm reset.

---

**NOTE:** When the CORE power domain is in RETENTION state, VDD2 voltage must either be at RETENTION or ON voltage level to maintain stable CORE power domain output values to the I/Os.

---

#### 4.11.3.2 Wake-Up Sequences (Transition from RETENTION/OFF to ON)

The PRM detects a wake-up event from the daisy chain. Several wake-up events can occur simultaneously, but PRM only sees the ORing of them. Depending on whether the CORE power domain is in RETENTION or OFF state, the following sequence is followed to wake up the CORE and MPU power domains:

1. When the CORE power domain wakes up from OFF/Retention power state, reset is asserted for both the MPU and the CORE power domains.
2. Both the MPU and the CORE power domains are switched to ON power state.
3. Domain clocks of both the MPU and the CORE power domains are restarted.
4.
  - (a) If the CORE power domain was in the OFF power state, its reset is released before the MPU power domain. This is done so that the SCM can restore the context and I/O configuration.
    - (a) Hardware restores the IO pad configuration and some configuration registers of the control module. This configuration has been saved in the scratchpad memory (by the Control Module Save procedure initiated by software control prior to the transition to OFF power state).
    - (b) PRCM switches the I/O pads configuration on the normal restored configuration (The I/O pad isolation is released).
    - (c) The reset is released for MPU power domain.
  - (b) If the CORE power domain is in the Retention power state, the reset is released for both the MPU and the CORE power domains at the same time.
5. When the MPU boots, the software accesses the SCM to read the wake-up event source (identified by the CONTROL.CONTROL\_PADCONF\_< IOpad>[15] WAKEUPEVENT bits in the SCM corresponding to all enabled pads).
6. The software disables the wake-up daisy chain by clearing the PRCM.PM\_WKEN\_WKUP[8] EN\_IO bit.

---

**NOTE:** A daisy-chain wake-up event always causes the MPU to restart and boot. Other independent wake-up events activated in off mode (for example, a GPIO wake-up event) always cause the CORE power domain to be activated. The MPU is wakened if a wake-up dependency has been set by the user.

---

#### 4.11.4 Device Off-Mode Sequences

Device off-mode sequencing requires preliminary settings that can be done during device initialization. The following actions are performed once and remain valid for all device off/on transitions:

1. Configure valid off and active pad configuration for each pad by programming the SCM CONTROL.CONTROL\_PADCONF\_< IOpad> register.
2. Save the active pad configuration by asserting the CONTROL.CONTROL\_PADCONF\_OFF[1] STARTSAVE bit in the SCM. This process can be repeated each time the active pad configuration of the device is changed.
3. Set the SCM to smart-idle mode by configuring the CONTROL. CONTROL\_SYSCONFIG[4:3] IDLEMODE bit field. This ensures that the module clocks remain active during the configuration save

procedure.

4. Disable all the modules running on system clock or switch them on the 32 kHz clock when required.
5. Configure the voltage regulator setup times (the PRCM.PRM\_VOLTSETUP1[15:0] SETUP\_TIME1 and PRCM.PRM\_VOLTSETUP1[31:16] SETUP\_TIME2 bit fields).
6. Set sys\_off\_mode de-assertion time in the PRCM.PRM\_VOLTOFFSET[15:0] OFFSET\_TIME bit field.
7. Configure the system clock oscillator setup time in the PRCM.PRM\_CLKSETUP[15:0] SETUP\_TIME bit field.

For information about the SCM, see the *System Control Module* chapter.

#### 4.11.4.1 Sleep Sequences

The sleep sequences exemplify the two types of device transitions from on to off mode:

- Device off-mode transition without using the SYS\_OFF\_MODE signal.
- Device off-mode transition using only the SYS\_OFF\_MODE signal.

##### 4.11.4.1.1 Device Off-Mode Transition without Using the SYS\_OFF\_MODE Signal

Each time the device enters I/O-pad-off configuration mode, the following sequence must be performed:

1. Software sets the PRCM.PM\_WKEN\_WKUP[8] EN\_IO bit to enable the I/O wake-up scheme.
2. The MPU initiates the sleep sequence. When all sleep conditions are met, all domain clocks are shut down. At this stage, all output pads are inactive and static.
3. The PRM configures the I/O daisy-chain for the wake-up detection scheme.
4. The CORE domain output is isolated.  
When conditions for entering off mode are met, the PRM proceeds with the sequence.
5. It switches off all domains, including the CORE power domain, and then switches from active mode pad configuration to off mode pad configuration.
6. It isolates the pads before the removal of VDD1 and VDD2.
7. It shuts down all analog cells (DPLL, DLL).
8. It switches to OFF all the DPLL power domains and the SR power domain.
9. It sends the off command for VDD1 to the voltage controller.
10. It shuts down the SRAM LDOs.
11. The daisy chain is now ready to detect I/O pad wake-up events.
12. The PRM sends the off command for VDD1 to the voltage controller. Through I<sup>2</sup>C4, the voltage controller requests the power IC to set VDD1 to the voltage corresponding to the PRM\_VC\_CMD\_VAL\_0[7:0] OFF bit field. (A legacy mode exists where vmode pins can be used instead of I<sup>2</sup>C4, depending on the PRM\_VOLTCTRL[4] SEL\_VMODE bit. In this case, the PRM asserts sys\_nvmode1 and the power IC updates VDD1 to its previously programmed value.)
13. Upon reception of the I<sup>2</sup>C4 transaction acknowledge, and after waiting for the VDD1 regulator setup time counter to expire (the PRM\_VOLTSETUP1[15:0] SETUPTIME1 bit field), the PRM sends the off command for VDD2 to the voltage controller. Through I<sup>2</sup>C4, the voltage controller requests the power IC to set VDD2 to the voltage corresponding to PRM\_VC\_CMD\_VAL\_1[7:0] OFF bit field. (If vmode legacy mode is used, the PRM asserts sys\_nvmode2 and the power IC restores VDD2 to its previously programmed value.)
14. Upon reception of the I<sup>2</sup>C4 transaction acknowledge, and after waiting for the VDD2 regulator setup time counter to expire (the PRM\_VOLTSETUP1[31:16] SETUPTIME2 bit field), the PRM gates the internal system clock.
15. It releases sys\_clkreq and disables the system clock oscillator (if used).
16. The PRM ramps down the wake-up LDO to 1 V.
17. It waits for a wake-up event from the daisy chain or from an internal event (timer) from the WKUP domain.

#### 4.11.4.1.2 Device Off-Mode Transition Using Only the SYS\_OFF\_MODE Signal

Depending on the external power IC capability and the user setting, VDD1 and VDD2 voltage control may use the direct sys\_off\_mode signal and not send the commands through the I<sup>2</sup>C interface.

In that case, the initial sequence for device off-mode transition is the same as in [Section 4.11.4.1.1, Device Off-Mode Transition Without Using SYS\\_OFF\\_MODE Signal](#), up to Step 8. After this, the following steps are executed:

1. It shuts down the SRAM LDOs.
2. It asserts sys\_off\_mode. At this point, VDD1 and VDD2 are shut down.
3. It ramps down the wake-up LDO to 1 V.
4. It releases CLKREQ and disables the system clock oscillator (if used)
5. It waits for a wake-up event from the daisy chain.

#### 4.11.4.2 Wake-Up Sequences

---

**NOTE:** vdds\_dpll\_per and vdds\_dpll\_dll can be ramped up at any time before VDD1 ramps up.

---

##### 4.11.4.2.1 Device Wakeup from Off Mode without Using the SYS\_OFF\_MODE Signal

On detection of a wake-up event from the daisy chain, the PRM performs the following steps:

1. It enables the system clock oscillator, asserts sys\_clkreq, and ramps up the wake-up LDO.
2. It waits for the oscillator set-up time and the wake-up LDO stabilization time.
3. It sends the on command for VDD2 to the voltage controller. Through I<sup>2</sup>C4, the voltage controller requests the power IC to set VDD2 to set the voltage corresponding to the PRM\_VC\_CMD\_VAL\_1[31:24] ON bit field. (A legacy mode exists where vmode pins can be used instead of I<sup>2</sup>C4, depending on the PRM\_VOLTCTRL[4] SEL\_VMODE bit. In this case, the voltage controller deasserts sys\_nvmode2 and the power IC restores VDD2 to its previously programmed value.) At this point, VDD2 ramps up (the reset is not yet asserted on VDD2 logic).
4. It waits for the VDD2 regulator setup time counter to expire. (PRM\_VOLTSETUP1[31:16] SETUPTIME2)
5. It sends the on command for VDD1 to the voltage controller. Through I<sup>2</sup>C4, the voltage controller requests the power IC to set VDD1 to set the voltage corresponding to the PRM\_VC\_CMD\_VAL\_0[31:24] ON bit field. (If vmode legacy mode is used, the voltage controller deasserts sys\_nvmode1 and the power IC restores VDD1 to its previously programmed value). At this point, VDD1 ramps up (the reset is not yet asserted on VDD1 logic).
6. It waits for the VDD1 regulator setup time counter to expire. (PRM\_VOLTSETUP1[15:0]SETUPTIME1)
7. It restarts the memory LDOs.
8. It powers up all analog cells on the VDD2 domain and waits for the settling time of the LDO and analog cells (internal counter).
9. The following steps can occur in parallel:
  - The DPLL, CORE, and MPU power domains are powered up.
  - The reset on the eFuse controller, DPLL, CORE, SR, and MPU power domains is asserted.
10. When the CORE, MPU, DPLLs, and SR are on, the PRM releases the eFuse controller reset, and the eFuse scan starts.
11. When the scan completes, the DPLL resets are released. The DPLLs are in bypass and the clocks start flowing (DPLL1 and DPLL3).
12. When the CORE and MPU domains are on, the PRM releases their corresponding domain output isolations.
13. When the CORE power domain is on and DPLL3 is in bypass, the reset timer for the CORE power domain starts.
14. When the MPU power domain is on and DPLL1 is in bypass, the reset timer for the MPU power domain starts.
15. When the CORE reset time expires, the CORE domain reset is released.

16. When the CORE domain exits reset and the SCM context and I/O configuration are restored from ScratchPad, memory starts.
17. When the PRM receives the acknowledge from the SCM, it releases the MPU and CORE domain output isolations and the I/O isolation.
18. The PRM switches the I/O pad configuration from off mode configuration to active mode configuration.
19. When the MPU reset time expires and pad configuration returns to normal mode, the MPU domain reset is released.
20. When the MPU boots, the software accesses the control module to read the wake-up event source.
21. The software disables the I/O wake-up daisy chain by clearing the PM\_WKEN\_WKUP[8] EN\_IO bit.

#### 4.11.4.2.2 Device Wakeup from Off Mode Using Only the SYS\_OFF\_MODE Signal

Depending on the external power IC capability and the user setting, VDD1 and VDD2 voltage control use the direct sys\_off\_mode signal and do not send commands through the I<sup>2</sup>C interface.

In that case, the first part of the sequence in [Section 4.11.4.2.1](#) is as follows.

Upon detection of a wakeup from the daisy chain, the PRM performs the following steps:

1. It enables the system clock oscillator and asserts sys\_clkreq.
2. It ramps up the wake-up LDO.
3. It releases sys\_off\_mode.
4. It waits for the system clock oscillator setup time.
5. It waits for VDD1 and VDD2 setup time. The two counts are started in parallel.
6. When both timers expire, the following steps happen in parallel:
  - Reset is asserted on the MPU and CORE power domains.
  - The MPU and CORE power domains are powered up.
  - The PRM restarts the CORE and processor memory LDOs.
  - The PRM powers up all analog cells in the VDD1 and VDD2 domains.

## 4.12 PRCM Basic Programming Model

The PRCM supports an extensive set of module-specific registers that allow programming control over numerous features of the clocks, resets, and power-management signals for each power domain of the device.

These registers are fully programmable and accessible by the MPU and the IVA2.2 subsystems.

Logically, the registers are grouped into five categories:

- Global
- Clock management
- Reset management
- Power management
- Voltage management

### 4.12.1 Global Registers

#### 4.12.1.1 Revision Information Registers

- CM\_REVISION: Indicates the CM module revision code; it is read-only
- PRM\_REVISION: Indicates the PRM module revision code; it is read-only

#### 4.12.1.2 PRCM Configuration Registers

- CM\_SYSCONFIG: Holds an AUTOIDLE bit to control the CM internal clock autogating feature
- PRM\_SYSCONFIG: Holds an AUTOIDLE bit to control the PRM internal clock autogating feature

### 4.12.1.3 Interrupt Configuration Registers

The PRM can interrupt the MPU and the IVA2.2 subsystems as a result of four events:

- PRM internal event (event generator, sleep transition, wake-up transition, voltage processors, voltage controller)
- Peripheral wake-up event for a peripheral with interrupt capability (GPTIMER[1..12], GPIO[1..6], McBSP[1..5], UART[1..3], HS USB OTG, I2C[1..3], McSPI[1..4], MMC[1,2], SR[1,2])
- Module/device-level event not associated with any interrupt (DPLL recalibration, I/O wakeup)

The PRM interrupt is enabled by programming the PRM\_IRQENABLE\_<processor\_name> register; the interrupt status can be read from the PRM\_IRQSTATUS\_<processor\_name> register.

The device has four processor interrupt registers:

- PRM\_IRQSTATUS\_MPU
- PRM\_IRQENABLE\_MPU
- PRM\_IRQSTATUS\_IVA2
- PRM\_IRQENABLE\_IVA2

#### 4.12.1.3.1 MPU Interrupt Event Sources

The MPU interrupt registers correspond to the interrupt sources connected to the interrupt line mapped to the MPU interrupt controller.

Multiple events can activate this interrupt line:

- MPU peripheral group wake-up event
- Event-generator module end-of-on time and end-of-off time events
- Sleep or wake-up transition (SGX, USBHOST, IVA2, PER, DSS, CAM, NEON, EMU power domains)
- DPLL1/DPLL2/DPLL3/DPLL4/DPLL5 recalibration request
- I/O pad wake-up event
- Voltage processor 1 or 2 OPP Change Done event
- Voltage processor 1 or 2 new voltage reached the minimum voltage value allowed.
- Voltage processor 1 or 2 new voltage reached the maximum voltage value allowed.
- Voltage processor 1 or 2 time-out occurred while waiting for the power IC device acknowledge.
- Voltage processor 1 or 2 new voltage is the same as the current one.
- Voltage processor 1 or 2 transaction is done.
- Slave address in an I<sup>2</sup>C frame sent by the voltage controller not acknowledged by the power IC device
- Register address in an I<sup>2</sup>C frame sent by the voltage controller not acknowledged by the power IC device
- Last byte of an I<sup>2</sup>C frame issued from the bypass port or the voltage manager FSM ports sent by the voltage controller not acknowledged by the power IC device

The end-of-on time period and end-of-off time period events of the event generator module are sources of interrupts to the MPU processor (the corresponding bits in the PRM\_IRQENABLE\_MPU are set to 1). The end-of-OFF time period is the source of wake-up events on the MPU domain.

The MPU can force a sleep or wake-up transition on some domains (SGX, USBHOST, IVA2, PER, DSS, CAM, NEON, EMU). The PRM triggers the MPU interrupt when the domain enters a power state. The software must clear the CM\_CLKSTCTRL\_<domain\_name> register only after getting the interrupt. If the software clears this bit before getting the interrupt, the interrupt never occurs, regardless of whether the transition occurs.

An interrupt for a peripheral with wake-up capability is enabled when the wake-up enable bit (PM\_WKEN\_<domain\_name> register type) and group select bit (PM\_<processor\_name>GRPSEL\_<domain\_name> type of register) are set to 1.

The PRM triggers its interrupt line on the I/O daisy chain wake-up event. This wake-up event is enabled by setting the corresponding bit in the PM\_WKEN\_WKUP register to 1.

The PRM triggers the MPU interrupt as long as the DPLL recalibration flag is set and the corresponding interrupt enable bit in the PRM\_IRQENABLE\_<processor\_name> register is set to 1. The recalibration flag is set by the DPLL and remains active if the DPLL is not reinitialized.

#### 4.12.1.3.2 MPU Interrupt Registers

##### 4.12.1.3.2.1 PRM\_IRQENABLE\_MPU (MPU Interrupt Enable Register)

The MPU interrupt enable register allows independent masking/unmasking of each MPU internal interrupt source.

---

**NOTE:** If the following interrupts are enabled and the MPU power domain is idled, then when the event occurs, the PRCM sets the interrupt that wakes up the power domain:

- DPLL1/DPLL2/DPLL3/DPLL4/DPLL5 recalibration event
  - Voltage controller errors
- 

##### 4.12.1.3.2.2 PRM\_IRQSTATUS\_MPU (MPU Interrupt Status Register)

The MPU interrupt status register provides the status of all PRCM internal events that can generate an MPU interrupt. Software must read this register to identify the interrupt cause, and then clear the pending interrupt by setting the corresponding bit to 1.

#### 4.12.1.3.3 IVA2.2 Interrupt Event Sources

The IVA2.2 interrupt registers correspond to the interrupt sources connected to the interrupt line mapped to the IVA2.2 interrupt controller.

Three events can activate this interrupt line:

- An IVA2.2 peripheral group wake-up event
- A force wake-up transition completion (IVA2 domain)
- A required IVA2 DPLL recalibration

The PRM also interrupts IVA2.2 if the corresponding bit in the PM\_IVA2GRPSEL\_WKUP register is set to 1.

The PRM triggers the interrupt line dedicated to the IVA2 processor when the MPU performs a force wake-up transition on the IVA2 domain. This interrupt is triggered under the same conditions as that of the MPU.

The PRM triggers an IVA2.2 interrupt if the DPLL recalibration flag is set and the corresponding interrupt enable bit in the PRM\_IRQENABLE\_<processor\_name> register is set to 1. The recalibration flag is set by the DPLL and remains active if the DPLL is not reinitialized.

#### 4.12.1.3.4 IVA2 Interrupt Registers

##### 4.12.1.3.4.1 PRM\_IRQENABLE\_IVA2 (IVA2.2 Interrupt Enable Register)

The IVA2.2 interrupt enable register allows independent masking/unmasking of each of the three internal interrupt sources.

---

**NOTE:** If the IVA2 DPLL recalibration event interrupt is enabled and the IVA2 power domain is idled, then when the event occurs, the PRCM sets the interrupt, thus waking up the power domain.

---

#### 4.12.1.3.4.2 PRM\_IRQSTATUS\_IVA2 (IVA2.2 Interrupt Status Register)

The IVA2.2 interrupt status register provides the status of the three events that can generate an IVA2.2 interrupt. Software must read the register to identify the interrupt cause, and then clear the pending interrupt by setting the corresponding bit to 1.

#### 4.12.1.4 Event Generator Control Registers

For details about the event generator module, see the public *ARM® Cortex™-A8 Technical Reference Manual*.

In the PRCM, three event generator registers allow configuration of the event generator module:

- PM\_EVGENCTRL\_MPU (event generator control register): Event-generator settings
- PM\_EVGENONTIM\_MPU (event generator on-time register): On-time duration setting
- PM\_EVGENOFFTIM\_MPU (event generator off-time register): Off-time duration setting

#### 4.12.1.5 Output Signal Polarity Control Registers

##### 4.12.1.5.1 CM\_POLCTRL (CM Polarity Control Register)

The CM\_POLCTRL register allows the setting of the polarity of sys\_clkout2 when gated (disabled). sys\_clkout2 can be gated to a low level or a high level, depending on the software programming of this register. [Figure 4-85](#) shows the normal behavior of sys\_clkout2 when gated.

Figure 4-85. sys\_clkout2 Gating Polarity Control

prcm-078

#### 4.12.1.5.2 **PRM\_POLCTRL (PRM Polarity Control Register)**

The PRM polarity control register allows the setting of the polarity of the external signals controlled by the PRM. It contains the following polarity control bits:

- OFFMODE\_POL: Polarity of sys\_off\_mode
- CLKOUT\_POL: Polarity of sys\_clkout1
- CLKREQ\_POL: Polarity of sys\_clkreq
- EXTVOL\_POL: Polarity of both sys\_nvmode signals: sys\_nvmode1 and sys\_nvmode2

At device power up, the reset values of polarity settings are OFFMODE\_POL = 1 and CLKREQ\_POL = 1. Depending on the system hardware implementation, these signals may or may not be used during device power up. For details about using these signals, see [Section 4.7, Clock Manager Functional Description](#),

#### 4.12.1.6 **SRAM Precharge Time Control Register**

##### 4.12.1.6.1 **PRM\_SRAM\_PCHARGE (Voltage SRAM Precharge Counter Register)**

The voltage SRAM precharge counter register allows the setting of the precharge duration of the SRAM. It has following bit field:

- PCHARGE\_TIME: Number of system clock cycles defined for the SRAM precharge duration

### 4.12.2 **Clock Management Registers**

#### 4.12.2.1 **System Clock Control Registers**

##### 4.12.2.1.1 **PRM\_CLKSRC\_CTRL (Clock Source Control Register)**

The clock source control register is dedicated to the clock source controls of the device. It contains the following bit fields:

- SYSCLKSEL: Indicates the oscillator mode (oscillator/bypass) and is automatically updated at power up
- AUTOEXTCLKMODE: Enables autogating for the system clock, depending on the device power state. The clock can be configured to be automatically gated when all power domains are in either OFF or RETENTION state. When the gating condition is satisfied, the internal oscillator is turned off, if it is used. Otherwise, sys\_clkreq is asserted to notify the external clock source to turn off.

---

**NOTE:** Power consumption is reduced with the SYS\_CLK off; however, wake-up latency is increased because of oscillator stabilization time after the clock is turned on again.

---

- SYSCLKDIV: Input divider (1, 2) of the system clock

##### 4.12.2.1.2 **PRM\_CLKSETUP (Source-Clock Setup Register)**

The source-clock setup register allows the setting of the setup time of the oscillator system clock, based on the number of 32-kHz clock cycles. This duration corresponds to the time required by the oscillator to stabilize before propagating the system clock.

Because the reset lasts long enough for oscillator stabilization, this register is not used at power-on reset of the device. This is ensured either by the external reset source (power IC) or by the reset extension in the PRCM (RSTTIME0 timer). The PRM\_CLKSETUP register is cleared on cold reset only.

##### 4.12.2.1.3 **PRM\_CLKSEL (Source-Clock Selection Register)**

The PRCM.PRМ\_CKSEL[2:0] SYS\_CLKIN\_SEL bit field is used to select the input frequency of the system clock (12, 13, 16.8, 19.2, 26 or 38.4 MHz).

## 4.12.2.2 External Clock Output Control Registers

### 4.12.2.2.1 PRM\_CLKOUT\_CTRL (Clock Out Control Register)

The PRM clock out control register provides control to enable and disable the gating of the sys\_clkout1 output clock.

### 4.12.2.2.2 CM\_CLKOUT\_CTRL (Clock Out Control Register)

The CM clock out control register provides control over the device output clock sys\_clkout2, which can be used externally for functional or test purposes. The register allows the following:

- Selection of the source clock for sys\_clkout2:
  - CORE\_CLK
  - SYS\_CLK
  - 96-MHz clock
  - 54-MHz clock
- Dividing-down the selected source clock by 1, 2, 4, 8, or 16
- Enabling/disabling of the gating of sys\_clkout2

## 4.12.2.3 DPLL Clock Control Registers

A set of registers controls the clock features of the five DPLLs ( DPLL1, DPLL2, DPLL3, DPLL4, and DPLL5):

- CM\_CLKSELn\_PLL\_<processor\_name>
- CM\_CLKSELn\_PLL
- CM\_CLKEN\_PLL\_processor\_name>
- CM\_CLKEN\_PLL
- CM\_AUTOIDLE\_PLL\_processor\_name>
- CM\_AUTOIDLE\_PLL
- CM\_IDLEST\_PLL\_<processor\_name>
- CM\_IDLEST\_CKGEN
- CM\_IDLEST2\_CKGEN

The following sections describe the purposes of these registers.

### 4.12.2.3.1 CM\_CLKSELn\_PLL\_<processor\_name> (Processor DPLL Clock Selection Register)

The processor DPLL clock selection register controls the clock configuration of DPLL1 and DPLL2, including the following features:

- The multiplier (M) and divider (N) values of the DPLL
- Selection of the fast bypass clock (CORE\_CLK or CORE\_CLK/2) in bypass mode
- Configuration of DPLL output clock divider values (M2 factor)

The device has four DPLL clock selection registers for DPLL1 and DPLL2:

- CM\_CLKSEL1\_PLL\_MPU: DPLL1 multiplier, divider, and fast bypass clock selection
- CM\_CLKSEL2\_PLL\_MPU: DPLL1 output clock divider selection
- CM\_CLKSEL1\_PLL\_IVA2: DPLL2 multiplier, divider, and fast bypass clock selection
- CM\_CLKSEL2\_PLL\_IVA2: DPLL2 output clock divider selection

### 4.12.2.3.2 CM\_CLKSELn\_PLL (DPLL Clock Selection Register)

The DPLL clock selection register controls the clock configuration for DPLL3, DPLL4, and DPLL5, including the following features:

- The multiplier (M) and divider (N) values of the DPLL

- Configuration of DPLL output clock divider values

The device has following DPLL clock selection registers for DPLL3, DPLL4, and DPLL5:

- CM\_CLKSEL1\_PLL: DPLL3 multiplier, divider, and output clock division configuration. Source selection for the 54-MHz and 48-MHz clock (48M\_FCLK) between DPLL4 output and sys\_altclk.
- CM\_CLKSEL2\_PLL: DPLL4 multiplier and divider configuration
- CM\_CLKSEL3\_PLL: Divider configuration for 96-MHz clock (96M\_FCLK)
- CM\_CLKSEL4\_PLL: DPLL5 multiplier and divider configuration
- CM\_CLKSEL5\_PLL: Divider configuration for 120-MHz clock (120M\_FCLK)

#### 4.12.2.3.3 CM\_CLKEN\_PLL\_<processor\_name> (Processor DPLL Clock Enable Register)

The processor DPLL clock enable register allows the enabling or disabling of DPLL1 and DPLL2. It allows an immediate setting of the DPLL.

The device has two DPLL clock enable registers, one for DPLL1 and one for DPLL2:

- CM\_CLKEN\_PLL\_MPU: DPLL1 (MPU)
- CM\_CLKEN\_PLL\_IVA2: DPLL2 (IVA2)

The CM\_CLKEN\_PLL\_<processor\_name> register allows programmable control of the following DPLL features:

- Low-power stop mode (only for DPLL2)/low-power bypass mode/lock mode selection
- Automatic recalibration enable/disable
- Programmable internal frequency range of the DPLL
- Frequency ramping feature disabled and enabled with programmable step duration (4 s, 20 s, or 40 s)
- The DPLL LP mode can be enabled or disabled. However, switching between LP and normal mode is effective only when the DPLL has performed a recalibration; therefore, the DPLL must lock or relock. Also, the LP mode control is considered only during the following transitions:
  - From bypass to lock
  - From stop mode to lock
  - From lock to relock

---

**NOTE:** DPLL1 enters its internal power state (MNBYPASS) after being released from reset or when a multiplier value of 0 or 1 is loaded into the DPLL. Therefore, even if the CM\_CLKEN\_PLL\_MPU[2:0] EN\_MPU\_DPLL bit field is reset to the low-power bypass mode, DPLL1 automatically transitions to MNBYPASS mode, because the multiplier value (the CM\_CLKSEL1\_PLL\_MPU[18:8] MPU\_DPLL\_MULT bit field) resets to 0.

---

#### 4.12.2.3.4 CM\_CLKEN\_PLL (DPLL Enable Register)

The DPLL enable register allows control of DPLL3, DPLL4, and DPLL5. It allows an immediate setting of the DPLLs. This register controls the following features of the two DPLLs:

- DPLL operation mode:
  - Low-power bypass, fast-relock bypass, and lock modes for DPLL3
  - Low-power bypass and lock modes for DPLL4
- Programmable automatic recalibration
- Programmable internal frequency range for the DPLL
- Frequency ramp-up feature disable/enable with programmable step duration
- The DPLL3 output M3X2 and the DPLL4 outputs M2X2, M3X2, M4X2, M5X2, and M6X2 clock paths can be powered down. However, the setting takes effect only when the output clock is gated. It is also powered down whenever the DPLL is in stop mode, regardless of the software settings.
- The DPLL LP mode can be enabled or disabled. However, switching between LP and normal mode is effective only when the DPLL has performed a recalibration; therefore, the DPLL must lock or relock. Also, the LP mode control is considered only during the following transition:

- From bypass to lock
- From stop mode to lock
- From lock to relock

#### 4.12.2.3.5 **CM\_AUTOIDLE\_PLL\_<processor\_name> (Processor DPLL Autoidle Register)**

The processor DPLL autoidle register allows the enabling/disabling of the automatic processor DPLL activity control. In automatic mode, the DPLL automatically enters low-power stop mode when the DPLL clock is not required. It is also restarted automatically.

The following are the device DPLL auto-control registers:

- CM\_AUTOIDLE\_PLL\_MPU: DPLL1 autoidle mode control
- CM\_AUTOIDLE\_PLL\_IVA2: DPLL2 autoidle mode control

#### 4.12.2.3.6 **CM\_AUTOIDLE\_PLL (DPLL Autoidle Register)**

The DPLL autoidle register allows the enabling/disabling of the automatic mode-switching control for DPLL3 and DPLL4. This automatic mode takes effect only when the DPLLs are locked.

DPLL3 can be configured to automatically switch to either low-power bypass mode or low-power stop mode when the CORE power domain clock is not required.

DPLL4 can be configured to automatically switch to low-power stop mode when the PER power domain clock is not required.

#### 4.12.2.3.7 **CM\_AUTOIDLE1\_PLL (DPLL5 Autoidle Register)**

The DPLL5 autoidle register allows the enabling/disabling of the automatic mode-switching control. This automatic mode takes effect only when the DPLL is locked.

When enabled, DPLL5 is automatically switched to low-power stop mode whenever the 120-MHz output clock is gated.

#### 4.12.2.3.8 **CM\_IDLEST\_CKGEN (Source-Clock Idle-Status Register)**

The source-clock idle-status register provides a status of DPLL3 and DPLL4 clock activity. It also provides the status of the functional clocks derived from DPLL4 output.

The activity status for DPLL3 and DPLL4 can be:

- DPLL is bypassed.
- DPLL is locked.

The activity status for the functional clocks can be:

- The functional 96-MHz clock is active, or not.
- The functional 48-MHz clock is active, or not.
- The functional 12-MHz clock is active, or not.
- The functional 54-MHz clock is active, or not.

The functional 96-MHz clock and all other functional clocks derived from it are active only when DPLL4 is locked and the clock is required.

The functional 48-MHz and 12-MHz clocks are qualified as active only if the clock is required and when the external alternate clock is selected as the source clock.

The functional 54-MHz clock (DSS\_TV\_CLK) is active only when DPLL4 is locked, selected as the source clock, and required.

#### 4.12.2.3.9 **CM\_IDLEST2\_CKGEN (DPLL5 Source-Clock Idle-Status Register)**

The source-clock idle-status register provides the status of DPLL5 clock activity. It also provides the status of the functional clocks derived from DPLL5 output.

The activity status for DPLL5 can be:

- DPLL is bypassed.
- DPLL is locked.

The activity status for the functional clocks can be:

- The 120-MHz functional clock is active, or not.
- The USIM functional clock is active, or not.
- The output stage of the 120-MHz functional clock is active, or not.

#### 4.12.2.3.10 **CM\_IDLEST\_PLL\_<processor\_name> (Processor DPLL Idle-Status Register)**

The processor DPLL idle-status register indicates the status of the processor DPLL: whether it is in locked or bypass mode.

The device DPLL idle-status registers are:

- CM\_IDLEST\_PLL\_MPU: DPLL1 activity status
- CM\_IDLEST\_PLL\_IVA2: DPLL2 activity status

#### 4.12.2.4 **Power-Domain Clock Control Registers**

An identical set of registers controls the clock features of the power domains in the device:

- CM\_CLKSEL\_<domain\_name>
- CM\_FCLKEN\_<domain\_name>
- CM\_ICLKEN\_<domain\_name>
- CM\_AUTOIDLE\_<domain\_name>
- CM\_IDLEST\_<domain\_name>
- CM\_CLKSTCTRL\_<domain\_name>
- CM\_CLKSTST\_<domain\_name>
- CM\_SLEEPDEP\_<domain\_name>

The following sections describe the purposes of these registers.

##### 4.12.2.4.1 **CM\_CLKSEL\_<domain\_name> (Clock Select Register)**

The clock select register controls the selection of the module or subsystem input clock frequency (except for the processor modules). Therefore, it deals only with modules or subsystems for which the frequency is scalable or selectable (the others have fixed and nonprogrammable frequencies). Both functional and interface clocks can be scaled. In most cases, their value is a divided value from the DPLL3 (CORE) or the DPLL4 (PER) output clock.

The device includes the following clock select registers:

- CM\_CLKSEL\_CORE: L3 and L4 interconnects and GPTIMER10 and 11 functional clocks
- CM\_CLKSEL\_CAM: Camera subsystem functional clock
- CM\_CLKSEL\_DSS: DSS functional clock 1 and TV functional clock
- CM\_CLKSEL\_PER: GPTIMER2, 3, 4, 5, 6, 7, 8, and 9 functional clocks
- CM\_CLKSEL\_SGX: SGX subsystem functional clock
- CM\_CLKSEL\_WKUP: GPTIMER1 functional clock and reset manager counter clock and USIMOCP functional clock

The 32-kHz functional clock (32K\_FCLK) is selected when the device enters off mode. The functional clock of the GPTIMER1 is selectable between the always-on 32K\_FCLK and the system clock (SYS\_CLK), but it is used with the 32-kHz clock.

The CM\_CLKSEL\_SGX register controls the SGX functional clock divider ratio, which is divided from the L3\_ICLK source clock. Table 4-88 summarizes L3\_ICLK ratio for different configurations of the register field.

**Table 4-88. SGX Functional Clock Ratio Settings**

CM_CLKSEL_SGX.CLKSEL_SGX	SGX_L3_FCLK
0x1	L3_ICLK
0x2	L3_ICLK/2
0x3	L3_ICLK/3
0x4	L3_ICLK/4

#### 4.12.2.4.2 CM\_FCLKEN\_<domain\_name> (Functional Clock Enable Register)

The functional clock enable register allows control of the functional clock activity of each module or subsystem. All module functional clocks are controllable by software, except for the MPU, interconnect, and memory subsystems, for which the clocks are automatically controlled by the PRCM.

The device has the following functional clock control registers:

- CM\_FCLKEN1\_CORE and CM\_FCLKEN3\_CORE: CORE domain nonsecure peripherals set
- CM\_FCLKEN\_CAM: Camera subsystem
- CM\_FCLKEN\_DSS: DSS subsystem
- CM\_FCLKEN\_PER: PER domain peripherals set
- CM\_FCLKEN\_IVA2: IVA2.2 subsystem
- CM\_FCLKEN\_SGX: SGX subsystem
- CM\_FCLKEN\_WKUP: WKUP domain peripherals set
- CM\_FCLKEN\_USBHOST: HS USB Host subsystem

The software effect is immediate and direct. The functional clock is turned on as soon as the bit is set, and turned off if the bit is cleared and the clock is not required by any module. On module wakeup, the functional clock can be automatically restarted.

---

**NOTE:** The functional clock supplies the functional part of a module or subsystem, which is not operational without its functional clock. In some cases, a module or a subsystem may require multiple functional clocks.

---

#### 4.12.2.4.3 CM\_ICLKEN\_<domain\_name> (Interface Clock Enable Register)

The interface clock enable register allows control of the interface clock activity of each module or subsystem. This register provides control over each module in the device.

The device has following interface clock control registers:

- CM\_ICLKEN1\_CORE, CM\_ICLKEN2\_CORE, and CM\_ICLKEN3\_CORE: CORE domain peripherals set
- CM\_ICLKEN\_CAM: Camera subsystem
- CM\_ICLKEN\_DSS: DSS subsystem
- CM\_ICLKEN\_PER: PER domain peripherals set
- CM\_ICLKEN\_SGX: SGX subsystem
- CM\_ICLKEN\_WKUP: WKUP domain peripherals set
- CM\_ICLKEN\_USBHOST: HS USB Host subsystem

This register has an immediate effect, causing the source of the interface clock to be effectively cut (if the appropriate bit is cleared and no module requires this clock) or activated (if the appropriate bit is set).

Independent functional and interface clock control registers provide potential power savings for each module. For example, because the configuration port and interface of the module are still active, disabling a functional clock of a module while keeping its interface clock active (leaving the module inactive but allowing access to its registers) reduces power consumption.

When the interface clock is disabled, the module cannot communicate with the reset of the device; therefore, it is in idle mode. For example, the interface clock of a peripheral can be disabled while its functional clock is active; it is then idled, from the device standpoint, while it can detect any external event. This configuration typically allows a main part of the device to go into idle mode while keeping a peripheral active and ready to wake up from an external event.

Because a module may or may not be able to function without its functional or interface clocks, power-management strategies must be adapted accordingly. This relation is programmable and is defined in the CLOCKACTIVITY bits of the module SYSCONFIG register; therefore, it requires consistent programming of the CM\_FCLKEN and CM\_ICLKEN registers.

---

**NOTE:** The interface clock ensures proper communication between any module and the interconnect (L3 or L4), in most cases supplying the module interface and registers.

---

#### 4.12.2.4.4 CM\_AUTOIDLE\_<domain\_name> (Autoidle Register)

The autoidle register holds an AUTOIDLE bit per module that belongs to the related power domain. Each AUTOIDLE bit enables/disables automatic (hardware) gating of a module interface clock.

When AUTOIDLE and ICLKEN are set for a module, the module interface clock is managed automatically (that is, by hardware control) according to the power domain clock activity; for example, stopped before a power domain sleep transition and reenabled on wakeup. [Table 4-89](#) lists the possible autoidle settings for the interface clock.

**Table 4-89. Interface Clock Autoidle Settings**

CM_AUTOIDLE.AUTO_<module>	CM_ICLKEN.EN_<module>	Interface Clock
0	0	Disabled
0	1	Enabled
1	0	Disabled
1	1	Automatic enabling/disabling

The device has the following autoidle control registers:

- CM\_AUTOIDLE1\_CORE, CM\_AUTOIDLE2\_CORE, and CM\_AUTOIDLE3\_CORE: CORE domain peripherals set
- CM\_AUTOIDLE\_CAM: Camera subsystem
- CM\_AUTOIDLE\_DSS: DSS subsystem
- CM\_AUTOIDLE\_PER: PER domain peripherals set
- CM\_AUTOIDLE\_WKUP: WKUP domain peripherals set
- CM\_AUTOIDLE\_USBHOST: HS USB Host subsystem

---

**NOTE:** For SmartReflex1 and 2, IVA2.2, and SGX modules, the automatic idle mode is always enabled, and is not software-controllable.

---

#### 4.12.2.4.5 CM\_IDLEST\_<domain\_name> (Idle-Status Register)

The idle-status register allows checking whether a target module is in idle mode or if an initiator module is in standby mode. The software should not access to a target module in idle mode. A target access, in this state, can lead to an error.

The idle mode of any module can depend on the configuration of the CM\_FCLKEN\_<domain\_name> and CM\_ICLKEN\_<domain\_name> registers, or may be controlled automatically by hardware, depending on the configuration of the CM\_AUTOIDLE\_<domain\_name> registers.

In the case of IVA2.2 subsystem, standby mode is reached after the IVA2.2 processor has performed its idle instruction.

The device has the following idle status registers:

- CM\_IDLEST\_MPU: MPU subsystem
- CM\_IDLEST1\_CORE, CM\_IDLEST2\_CORE, and CM\_IDLEST3\_CORE: CORE domain peripherals set
- CM\_IDLEST\_CAM: Camera subsystem
- CM\_IDLEST\_DSS: DSS
- CM\_IDLEST\_PER: Peripheral domain peripherals set
- CM\_IDLEST\_NEON: NEON subsystem
- CM\_IDLEST\_IVA2: IVA2.2 subsystem
- CM\_IDLEST\_SGX: SGX subsystem
- CM\_IDLEST\_WKUP: WKUP domain peripherals set
- CM\_IDLEST\_USBHOST: HS USB Host subsystem

#### 4.12.2.4.6 CM\_CLKSTCTRL\_<domain\_name>(Clock State Control Register)

The clock state control register holds a CLKTRCTRL\_<clock domain> bit field for each clock domain in the power domain. It controls the hardware- and software-supervised state transitions between active and inactive states. [Table 4-90](#) lists the clock state transition settings.

**Table 4-90. Clock State Transition Settings**

CM_CLKSTCTRL_<pwr domain>. CLKTRCTRL_<clk domain>	Description
0x0	The automatic hardware-supervised mode is disabled. The clocks in a clock domain cannot be cut automatically. This prevents any power transition on the power domain.
0x1	Starts software-supervised (forced) sleep transition on the domain. All clocks in the clock domain are automatically cut whenever the initiators in the modules are in standby mode.
0x2	Starts software-supervised (forced) wake-up transition on the domain. The clocks in the clock domain are restarted.
0x3	The automatic hardware-supervised mode is enabled, and the clocks in the clock domain are automatically cut whenever the modules and subsystem in the clock domain are in idle or standby mode and the domain dependencies are met.

The hardware-supervised mode and the software-supervised (forced) sleep mode are mutually exclusive. It is a software decision to program one mode or another, and the software programs the PRCM accordingly.

The hardware-supervised mode is coupled to the sleep and wake-up dependencies programmed in the PRCM, whereas the software-supervised mode must be independent of those dependencies. Therefore, the sleep and wake-up dependencies must be disabled before the software forces a sleep transition on a power domain; otherwise, the forced-domain will be wakened immediately because of the wake-up dependency.

The device has the following clock state control registers:

- CM\_CLKSTCTRL\_MPU: MPU subsystem clock domain
- CM\_CLKSTCTRL\_CORE: L3, L4, and D2D clock domains
- CM\_CLKSTCTRL\_CAM: Camera subsystem clock domain
- CM\_CLKSTCTRL\_DSS: DSS clock domain
- CM\_CLKSTCTRL\_PER: Peripherals clock domain
- CM\_CLKSTCTRL\_NEON: NEON clock domain
- CM\_CLKSTCTRL\_IVA2: IVA2.2 clock domain
- CM\_CLKSTCTRL\_SGX: Graphics clock domain
- CM\_CLKSTCTRL\_EMU: Emulation clock domain
- CM\_CLKSTCTRL\_USBHOST: HS USB Host clock domain

The CORE domain has three clock domains (L3, L4, and D2D); it does not have forced sleep and forced wake-up ability.

Although the sleep transition in the MPU power domain cannot be initiated by software using this register, a software-initiated forced wake-up capability exists. This can be used to wake up the MPU power domain if it does not wake up when the CORE power domain wakes up (the MPU wake-up-dependency PM\_WKDEP\_MPU[0] EN\_CORE bit is set to 0).

If the hardware-supervised mode is enabled, the following occur:

- The MPU domain clock is automatically cut if the MPU executes the wait-for-interrupt instruction.
- The IVA2 domain clock is automatically cut when the DSP completes its idle procedure, and the IVA2.2 subsystem is ready for standby.
- The L3 domain clock is automatically cut when all initiators are in standby mode and slave ports are idled.
- The L4 domain clock is automatically cut when all peripherals and slave ports are idled.
- The DSS interface clock is automatically cut when it stops fetching data from the frame buffer (provided the MPU is also in standby mode, if sleep dependency in the MPU power domain is enabled). The display functional clock is controlled only by the CM\_FCLKEN\_DSS register.
- The PER domain clock is automatically cut when all initiators are in standby mode and all slave ports are in idle (provided the MPU and the DSP are in standby mode and the CORE power domain is INACTIVE, if sleep dependency in their domains is enabled).
- Because of the hardwired sleep dependency between NEON and the MPU domain, NEON can go into idle only if the MPU goes into standby mode. The MPU domain must also be configured in automatic hardware supervised mode for the NEON power domain idle transition to occur.
- The USBHOST power domain clock is automatically cut whenever the USBHOST is in standby mode (provided MPU is also in standby mode, if sleep dependency in the MPU domain is enabled, and IVA2 is also in standby mode, if sleep dependency in the IVA2 domain is enabled).

---

**NOTE:** Hardware-supervised mode must not be used for the SGX and CAM power domains when smart-standby is enabled.

---

#### 4.12.2.4.7 **CM\_CLKSTST\_<domain\_name> (Clock State Status Register)**

The clock state status register logs the activity status of the power domain clock. This includes the activity of the interface clocks running only on the domain.

The device has following clock state status registers:

- CM\_CLKSTST\_MPU: MPU subsystem clock activity
- CM\_CLKSTST\_CORE: L3 clock domain activity and L4 clock domain activity
- CM\_CLKSTST\_CAM: Camera subsystem clock activity
- CM\_CLKSTST\_DSS: DSS clock activity
- CM\_CLKSTST\_PER: PER clock domain activity
- CM\_CLKSTST\_IVA2: IVA2.2 clock domain activity
- CM\_CLKSTST\_SGX: Graphics subsystem clock activity
- CM\_CLKSTST\_EMU: Emulation clock activity
- CM\_CLKSTST\_USBHOST: USBHOST clock activity

#### 4.12.2.4.8 **CM\_SLEEPDEP\_<domain\_name> (Sleep Dependency Control Register)**

The sleep dependency control register allows the enabling or disabling of the sleep transition dependency of a power domain with respect to other power domains.

The device has following sleep dependency registers:

- CM\_SLEEPDEP\_CAM: CAM power domain sleep dependency with the MPU power domain
- CM\_SLEEPDEP\_DSS: Display power domain sleep dependency with the MPU power domain and the IVA2 power domain

- CM\_SLEEPDEP\_PER: PER power domain sleep dependencies with the MPU, IVA2, and CORE power domains
- CM\_SLEEPDEP\_SGX: SGX power domain sleep dependency with the MPU power domain
- CM\_SLEEPDEP\_USBHOST: USBHOST power domain sleep dependency with the MPU and IVA2 power domains

Although the CORE power domain is composed of L3 and L4 clock domains, the sleep dependency with the L3 clock domain is always enabled (not programmable by software); there is no sleep dependency between the PER power domain and the CORE\_L4 clock domain.

The dependencies listed in [Table 4-91](#) can be enabled or disabled by software.

**Table 4-91. Sleep Dependency Settings**

Dependent Domain	Parent Domain	MPU	IVA2	CORE-L3
CAM		Software controlled		
DSS		Software controlled	Software controlled	
PER		Software controlled	Software controlled	Always enabled
SGX		Software controlled		
USBHOST		Software controlled	Software controlled	

#### 4.12.2.5 Domain Wake-Up Control Registers

The following modules have programmable wake-up control:

- CORE power domain:
  - USBTLL
  - HS USB OTG
  - McBSP 1 and 5
  - GPTIMER[10, 11]
  - UART[1,2]
  - I2C[1..3]
  - McSPI[1..4]
  - MMC[1,2, 3]
- PER power domain:
  - McBSP[2..4]
  - GPTIMER[2..9]
  - UART 3
  - WDTIMER3
  - GPIO[2..6]
- WKUP power domain:
  - GPTIMER[1, 12]
  - GPIO1
  - SR[1,2]
  - I/O pad
  - USIM OCP
- DSS power domain:
  - DSS subsystem
- USBHOST power domain:
  - HS USB Host subsystem

The registers in the following sections control the wake-up settings.

#### 4.12.2.5.1 *PM\_WKEN\_<domain\_name> (Wake-Up Enable Register)*

The wake-up enable register applies only to modules that can generate wake-up events. It allows the enabling or disabling of the wakeup of the related power domain on a module or subsystem wake-up event. Each EN\_<module> bit in the register enables/disables the wake-up event from the module to the PRCM.

The device has the following wake-up enable registers:

- PM\_WKEN1\_CORE and PM\_WKEN3\_CORE: CORE domain modules wake-up control
- PM\_WKEN\_DSS: Display subsystem (DSS) wake-up control
- PM\_WKEN\_PER: Peripheral domain modules wake-up control
- PM\_WKEN\_WKUP: WKUP domain modules wake-up control
- PM\_WKEN\_USBHOST: HS USB Host subsystem wake-up control

---

**NOTE:**

- The wake-up capability of GPTIMER12 (the secure timer) is not programmable, but is always enabled.
  - The wake-up signals issued from the MPU and IVA2.2 INTCs are nonmaskable in the PRCM. However, they cannot be generated if the corresponding interrupts are masked in the INTCs.
- 

#### 4.12.2.5.2 *PM\_WKST\_<domain\_name> (Wake-Up Status Register)*

The wake-up status register logs wake-up events from all modules. Each ST\_<module> bit of this register logs a given module-generated wake-up event.

The device has the following wake-up status registers:

- PM\_WKST1\_CORE and PM\_WKST3\_CORE: CORE domain modules wake-up event status
- PM\_WKST\_PER: Peripheral domain modules wake-up event status
- PM\_WKST\_WKUP: WKUP domain modules wake-up event status
- PM\_WKST\_USBHOST: HS USB Host subsystem wake-up control

The functional clock of the module causing the wakeup automatically restarts on the wakeup, but the software must enable the functional clock (CM\_FCLKEN\_<domain\_name> register) before clearing the wake-up status bit.

---

**NOTE:**

- Software must clear this register before a new sleep transition request; otherwise, the register prevents the sleep transition from occurring.
  - If the PRM interrupt is enabled on a module wakeup, the PM\_WKST\_<domain\_name> must be cleared before clearing the PRM\_IRQSTATUS\_<processor\_name> interrupt status register.
- 

#### 4.12.2.5.3 *PM\_WKDEP\_<domain\_name> (Wake-Up Dependency Register)*

The wake-up dependency register allows the enabling/disabling of a wake-up dependency between power domains. When a domain wakes up, it can wake up another domain.

The device has the following wake-up dependency registers:

- PM\_WKDEP\_MPU: MPU power domain wake-up dependency with the following domains:
  - CORE
  - IVA2
  - WKUP
  - DSS
  - PER
- PM\_WKDEP\_DSS: DSS power domain wake-up dependency with the following domains:

- MPU
- IVA2
- WKUP
- PM\_WKDEP\_CAM: The CAM power domain has programmable wake-up dependency with the following domains:
  - MPU
  - IVA2
  - WKUP
- PM\_WKDEP\_PER: The PER power domain has programmable wake-up dependency with the following domains:
  - MPU
  - IVA2
  - WKUP
  - CORE

The PER power domain can be wakened only by a wakeup of the L3 and D2D clock domains, not by an L4 clock domain.

- PM\_WKDEP\_NEON: The NEON power domain has programmable wake-up dependency with the following domain:
  - MPU
- PM\_WKDEP\_IVA2: The IVA2 power domain has programmable wake-up dependency with the following domains:
  - MPU
  - PER
  - WKUP
  - CORE
- PM\_WKDEP\_SGX: The SGX power domain has programmable wake-up dependency with the following domains:
  - MPU
  - IVA2
  - WKUP
- PM\_WKDEP\_USBHOST: The USBHOST power domain has programmable wake-up dependency with the following domains:
  - MPU
  - IVA2
  - WKUP
  - CORE

There is no wake-up dependency control for the WKUP power domain, because it is always on.

Because the CORE power domain wake-up dependencies are not programmable, the CORE power domain always wakes up on a wake-up event on the following domains:

- MPU
- IVA2
- WKUP
- CAM
- DSS
- SGX
- PER
- USBHOST

#### 4.12.2.5.4 **PM\_<processor\_name>GRPSEL\_<domain\_name> (Processor Group Selection Register)**

The processor group selection register allows defining the group of modules in the domain that can wake up a processor domain (MPU or IVA2). This bit is effective only if the module wake-up capability is enabled (PM\_WKEN\_<domain\_name> register).

The device has the following processor group selection registers:

- PM\_MPUGRPSEL1\_CORE and PM\_MPUGRPSEL3\_CORE: CORE power domain modules MPU wake-up control
- PM\_IVA2GRPSEL1\_CORE and PM\_IVA2GRPSEL3\_CORE: CORE power domain modules IVA2 wake-up control
- PM\_MPUGRPSEL\_PER: PER power domain modules MPU wake-up control
- PM\_IVA2GRPSEL\_PER: PER power domain modules IVA2 wake-up control
- PM\_MPUGRPSEL\_WKUP: WKUP power domain modules MPU wake-up control
- PM\_IVA2GRPSEL\_WKUP: WKUP power domain modules IVA2 wake-up control
- PM\_MPUGRPSEL\_USBHOST: HS USB Host subsystem MPU wake-up control
- PM\_IVA2GRPSEL\_USBHOST: HS USB Host subsystem IVA2 wake-up control

---

**NOTE:**

- The wake-up capability of GPTIMER12 (the secure timer) is always attached to the MPU group.
  - The wake-up capability of the DSS is always attached to the MPU group; it cannot be attached to the IVA2.2, and therefore is not programmable.
- 

### 4.12.3 **Reset Management Registers**

#### 4.12.3.1 **Reset Control**

##### 4.12.3.1.1 **PRM\_RSTTIME (Reset Time Register)**

The reset time register provides control over reset duration. Two durations are configurable:

- RSTIME1: Minimum duration (by default, two cycles of the 32-kHz clock) of the global warm reset (sys\_nreswarm) assertion for external devices, such as flash memories. At power-up reset, DPLLs are reset and the power domains are switched on and stabilized during this duration.
- RSTIME2: Minimum duration (by default, 16 cycles of the RM\_ICLK clock) to control power domain resets when the domain clocks are on.

For global cold and warm resets, the reset is applied for the RSTIME1 + RSTIME2 duration. In the other cases, when a power domain individually goes from off to active, the reset is applied only for the RSTIME2 duration (plus the power domain wake-up duration).

RSTIME1 and RSTIME2 can be reprogrammed for different behavior after the initial power up.

##### 4.12.3.1.2 **RM\_RSTCTRL\_<domain\_name> (Reset Control Register)**

The reset control register provides control over the local domain software reset.

Most device modules include an individual software reset that can be controlled using the related module SYS\_CONFIG register.

The RM\_RSTCTRL\_<domain\_name> register is used for specific subsystems or modules that do not support this local reset or that require a specific system control (the IVA2.2 subsystem).

The PRM\_RSTCTRL register also handles the global software warm reset control.

The device includes the following reset control registers:

- PRM\_RSTCTRL: This register allows control of the assertion of the global software reset and the DPLL3 software reset. These bits are automatically cleared. Assertion of the DPLL3 software reset triggers a device global cold reset. The reset condition of this register depends on the bit field:
  - The RST\_GS bit is set on any global source of reset (warm or cold).
  - The RST\_DPLL3 bit is set only on a global cold source of reset.
- RM\_RSTCTRL\_IVA2: IVA2 power domain software resets the IVA2.2 and Video hardware accelerator subsystems. Both subsystems are held under reset after power up and are released by software.

#### **4.12.3.1.3 RM\_RSTST\_<domain\_name> (Reset Status Register)**

The reset status register logs any source that has generated a reset in the related power domain. Depending on the domain, several causes of reset can be logged:

- Global device cold reset
- Global device warm reset
- Power domain transition (OFF to ACTIVE, and INACTIVE to ACTIVE)
- Software reset
- Processor emulation reset

The PRM\_RSTST register logs the source of the global reset:

- VDD1/VDD2 voltage manager reset
- External warm reset
- Secure watchdog reset
- MPU watchdog reset
- Security violation reset
- Global software reset and DPLL3 software reset
- Global cold reset

The device includes the following reset status registers:

- RM\_RSTST\_MPU
- RM\_RSTST\_CORE
- RM\_RSTST\_DSS
- RM\_RSTST\_CAM
- RM\_RSTST\_IVA2
- RM\_RSTST\_PER
- RM\_RSTST\_NEON
- RM\_RSTST\_SGX
- RM\_RSTST\_EMU
- PRM\_RSTST
- RM\_RSTST\_USBHOST

Only the RM\_RSTST\_CORE, RM\_RSTST\_IVA2, and PRM\_RSTST registers log software sources of reset.

Each bit of these registers is set on the effective release of the respective reset signal.

## 4.12.4 Power Management Registers

### 4.12.4.1 PM\_PWSTCTRL\_<domain\_name> (Power State Control Register)

The power state control register allows controlling the power state transition of the domain.

This register holds the following bit fields:

- **POWERSTATE:** Power state (ON, RETENTION, or OFF) to be applied for the next transition
- **LOGICRETSTATE:** Logic is retained or switched off when the domain goes into retention. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMRETSTATE[1 to X]:** Memory block *i* is retained (RAM state retained) or switched off (RAM state not retained) when the domain goes into retention. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMONSTATE[1 to X]:** Memory block *i* in the domain is on (RAM active), retained (RAM inactive but state retained) or switched off (RAM state not retained) when the domain is on. This feature is domain-dependent and is not necessarily programmable (read only).
- **MEMORYCHANGE:** Allows updating the memory state according to latest MEMONSTATE[1 to X] setting.

The device has the following power state control registers:

- **PM\_PWSTCTRL\_MPU:** MPU domain power management
- **PM\_PWSTCTRL\_CORE:** CORE domain power management
- **PM\_PWSTCTRL\_SGX:** SGX domain power management
- **PM\_PWSTCTRL\_DSS:** DSS domain power management
- **PM\_PWSTCTRL\_CAM:** CAM domain power management
- **PM\_PWSTCTRL\_PER:** PER domain power management
- **PM\_PWSTCTRL\_NEON:** NEON domain power management
- **PM\_PWSTCTRL\_IVA2:** IVA2 domain power management
- **PM\_PWSTCTRL\_USBHOST:** USBHOST domain power management

MPU domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- Logic and L1 cache state are switchable to off and retention states when the power domain is in RETENTION state.
- L2 cache state is switchable to off and retention states when the power domain is in RETENTION state.
- L2 cache state is switchable to off and on states when the power domain is in ON state.
- L2 cache state can be switched dynamically when the domain state is ON (no power transition is required).
- The L1 cache is always on when the power domain state is ON.

CORE domain power management has the following features:

- The power state is programmable to ON, RETENTION, or OFF states.
- nonretained logic is switchable to off and retention states when the power domain is in RETENTION state.
- Memory bank 1 and 2 states are switchable to off and retention states when the power domain is in RETENTION state.
- Memory bank 1 and 2 states are switchable to off, retention, and on states when the power domain is in ON state.
- Memory bank 1 and 2 states can be switched dynamically when the domain state is ON (no power transition is required).

SGX domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.

- The memory is always in retention state when the power domain is in RETENTION state.
- The memory is always in on state when the power domain is in ON state.

DSS domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.
- The memory is always in retention state when the power domain is in RETENTION state.
- The memory is always in on state when the power domain is in ON state.

CAM domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.
- The memory is always in retention state when the power domain is in RETENTION state.
- The memory is always in on state when the power domain is in ON state.

PER domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.

NEON domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.

IVA2 domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- Logic state is switchable to off and retention states when the power domain is in RETENTION state.
- L1 cache state is switchable to off and retention states when the power domain is in RETENTION state.
- L1 flat memory state is switchable to off and retention states when the power domain is in RETENTION state.
- L2 cache state is switchable to off and retention states when the power domain is in RETENTION state.
- L2 flat memory state is switchable to off and retention states when the power domain is in RETENTION state.
- L1 cache state is always on when the power domain is in ON state.
- L1 flat memory state is always on when the power domain is in ON state.
- L2 cache state is switchable to off and on states when the power domain is in ON state.
- L2 flat memory state is always on when the power domain is in ON state.
- L2 cache memory state can be switched dynamically to off state and back to on state when the domain state is ON (no domain power transition is required).

USBHOST domain power management has the following features:

- The power state is programmable to ON, RETENTION, and OFF states.
- The logic is always in retention state when the power domain is in RETENTION state.
- The memory is always in retention state when the power domain is in RETENTION state, and the memory is always on when the power domain is in ON state.

The EMU power state is not programmable. The EMU domain is always powered down when the software or hardware conditions that allow a power transition are met. Thus, the EMU domain is automatically powered down after the power-up sequence if no emulation hardware is connected.

**NOTE:** The L1 cache memory bank can be configured to be either entirely or partially cache or flat memory. This configuration is done in the IVA2.2 subsystem. The part that is configured as cache memory can be retained; however, because tag and validity bit information are not retained in the case of L1 cache, this part cannot be retrieved after wakeup. It is important to configure the L1 cache memory state with a consistent value depending on the chosen configuration when the domain is in RETENTION state:

- If the L1 cache memory bank is entirely configured as cache memory, set the PM\_PWSTCTRL\_IVA2[8] SHAREDL1CACHEFLATRETSTATE bit to the same value as the PM\_PWSTCTRL\_IVA2[2] LOGICRETSTATE bit.
- If the L1 cache memory bank is entirely or partially configured as flat memory, set the PM\_PWSTCTRL\_IVA2[8] SHAREDL1CACHEFLATRETSTATE bit to the same value as the PM\_PWSTCTRL\_IVA2[9] L1FLATMEMRETSTATE bit.

The same mechanism applies to the L2 cache memory bank.

Because the L2 cache may not be useful in a system when the DSP frequency and interconnect frequencies are in the same range, this memory bank can be switched off when the domain is on.

#### 4.12.4.2 PM\_PWSTST\_<domain\_name> (Power State Status Register)

The power state status register provides the status of the power state transition of the domain.

This register holds the following bit fields:

- POWERSTATESTATUS: Indicates the current power state of the domain (ON, RETENTION, OFF)
- LOGICSTATESTATUS: Indicates the current logic power state
- MEMORYSTATESTATUS: Indicates the current memory power state
- INTRANSITION: Indicates an ongoing power state transition from ON power state to INACTIVE, OFF, or RETENTION, and from INACTIVE, OFF, or RETENTION power states to ON power state

The memory power state is updated by performing a dynamic memory change (the PM\_PWSTCTRL\_<domain\_name> MEMORYCHANGE bit). Software clears the PM\_PREPWST\_<domain\_name> register (this forces a memory change to the same value).

The device has the following power state status registers:

- PM\_PWSTST\_MPU: MPU domain power state status
- PM\_PWSTST\_CORE: CORE domain power state status
- PM\_PWSTST\_SGX: SGX domain power state status
- PM\_PWSTST\_DSS: DSS domain power state status
- PM\_PWSTST\_CAM: CAM domain power state status
- PM\_PWSTST\_PER: PER domain power state status
- PM\_PWSTST\_NEON: NEON domain power state status
- PM\_PWSTST\_EMU: EMU domain power state status
- PM\_PWSTST\_IVA2: IVA2 domain power state status
- PM\_PWSTST\_USBHOST: USBHOST domain power state status

The MPU domain power state status register indicates the current domain, logic, L1 cache (ON or OFF), and L2 cache (ON, RETENTION, or OFF) power state.

The CORE domain power state status register indicates the current domain, logic (ON or OFF), and memory banks 1 and 2 (ON, RETENTION, or OFF) power state.

The SGX, DSS, CAM, PER, NEON, USBHOST, and EMU domain power state status registers indicate the current domain (ON, INACTIVE, RETENTION, or OFF) power state or that the power domain transition is in progress. Because the SGX memory state is not programmable and reflects the power state, the SGX power domain does not require a memory power state.

The IVA2 domain power state status register indicates the current domain (ON, INACTIVE, RETENTION, or OFF), logic (ON or OFF), L1 cache and flat memory (ON, RETENTION, or OFF), L2 cache and flat memory (ON, RETENTION, or OFF) power state status.

### 4.12.4.3 PM\_PREPWSTST\_<domain\_name> (Previous Power State Status Register)

The previous power state status register indicates the power state entered during the last sleep transition. The information in this register is useful when the domain switches back to on state (following a wake-up transition). This register must only be read when the domain power state is ON.

This register has the following bit fields:

- LASTPOWERSTATEENTERED: Last domain power state entered after the last sleep transition
- LASTLOGICSTATEENTERED: Last logic power state entered after the last sleep transition
- LASTMEMORYSTATEENTERED: Last memory power state entered after the last sleep transition or before the last memory change update

The device has the following previous power state status registers:

- PM\_PREPWSTST\_MPU: The MPU power domain previous power state status
- PM\_PREPWSTST\_CORE: The CORE power domain previous power state status
- PM\_PREPWSTST\_SGX: The SGX power domain previous power state status
- PM\_PREPWSTST\_DSS: The DSS power domain previous power state status
- PM\_PREPWSTST\_CAM: The CAM power domain previous power state status
- PM\_PREPWSTST\_PER: The PER power domain previous power state status
- PM\_PREPWSTST\_NEON: The NEON power domain previous power state status
- PM\_PREPWSTST\_IVA2: The IVA2 power domain previous power state status
- PM\_PREPWSTST\_USBHOST: The USBHOST power domain previous power state status

The previous power state status register for the MPU power domain indicates the previous domain, logic, L1 cache (ON or OFF), and L2 cache (ON, RETENTION, or OFF) power state.

The previous power state status register for the CORE power domain indicates the previous domain, logic (ON or OFF), and memory banks 1 and 2 (ON, RETENTION, or OFF) power state.

The previous power state status registers for the SGX, DSS, CAM, PER, NEON, USBHOST and EMU power domains indicate the current domain (ON, INACTIVE, RETENTION, or OFF) power state. The SGX power domain does not require a memory power state status, because the SGX memory state is not programmable and reflects the power state.

The previous power state status register for the IVA2 power domain indicates the previous domain (ON, INACTIVE, RETENTION, or OFF), logic (ON or OFF), L1 cache and flat memory (ON, RETENTION, or OFF), and L2 cache and flat memory (ON, RETENTION, or OFF) power state status.

The current memory state depends on the setting of the PM\_PWSTCTRL\_<domain\_name> MEMONSTATE bit during the last wake-up transition or during the last memory change operation.

This register must be cleared by software by writing any value to it; this operation must be done when the domain power state is ON. Clearing this register does the following:

- Resets the PM\_PREPWSTST\_<domain\_name> LASTPOWERSTATEENTERED bit field and the PM\_PREPWSTST\_<domain\_name> LASTLOGICSTATEENTERED bit to the ON state
- Sets the bit fields corresponding to the last memory state of the power domain to the current memory state

---

**NOTE:** Performing a memory change (the PM\_PWSTCTRL\_<domain\_name>[3] MEMORYCHANGE bit for MPU, IVA2, and CORE) has the same effect as clearing this register.

---

## 4.12.5 Voltage Management Registers

### 4.12.5.1 External Voltage Control Register Descriptions

#### 4.12.5.1.1 PRM\_VOLTSETUP (Voltage Setup Time Register)

The device has two voltage setup registers:

- PRM\_VOLTSETUP1
- PRM\_VOLTSETUP2

These registers allow controlling the setup time of the VDD1 and VDD2 power supplies when the device exits the off mode or when the voltage is scaled. It is a constant value that depends on the connected power IC. At power-up reset, this register is not used, because the external power supply is already stable. After boot up, the software must set the correct value to ensure proper sequences when performing voltage scaling or sleep transitions.

The PRM\_VOLTSETUP1 register has the following bit fields:

- SETUPTIME1: The setup time of the VDD1 regulator. It is computed as 8 x NbCycles (number of cycles of the system clock), where NbCycles is configured in the register bit field.
- SETUPTIME2: The setup time of the VDD2 regulator. It is computed as 8 x NbCycles (number of cycles of the system clock), where NbCycles is configured in the register bit field.

The PRM\_VOLTSETUP1 register is used when the device exits the OFF/RET/SLEEP mode (or enters OFF/RET/SLEEP mode) and manages the sequencing of the voltage regulation steps (the PRM\_VOLTCTRL[3] SEL\_OFF bit is set to 0).

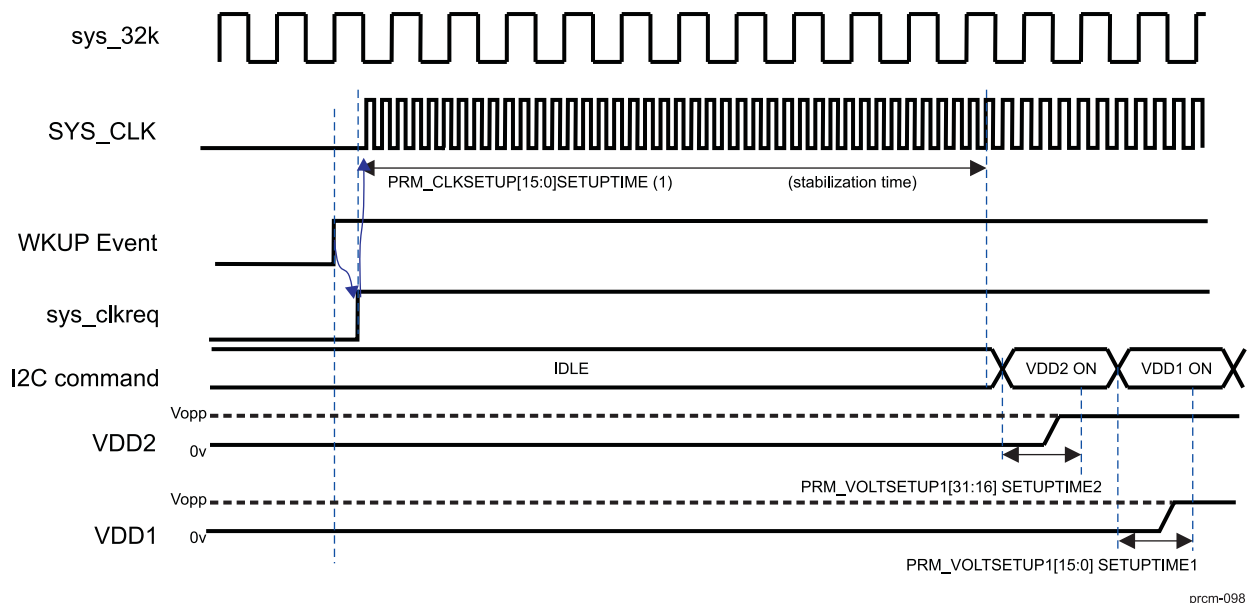

The PRM\_VOLTSETUP2 register has the following bit field:

- OFFMODESETUPTIME: The number of 32-kHz clock cycles for the overall setup time of the power management IC when coming back from off mode (VDD1,VDD2,VDD\_PLL,...).

The PRM\_VOLTSETUP2 register is used only when the device exits off mode and an external power IC manages the sequencing of the voltages regulation steps (PRM\_VOLTCTRL[3] SEL\_OFF is set to 1).

Figure 4-86 shows off mode wakeup using I<sup>2</sup>C.

Figure 4-86. OFF Mode Wake Up Using I2C

(1) PRM\_VOLTSETUP1[31:16] SETUPTIME2 and PRM\_VOLTSETUP1[15:0] SETUPTIME1 are not used during voltage scaling (between different OPPs).

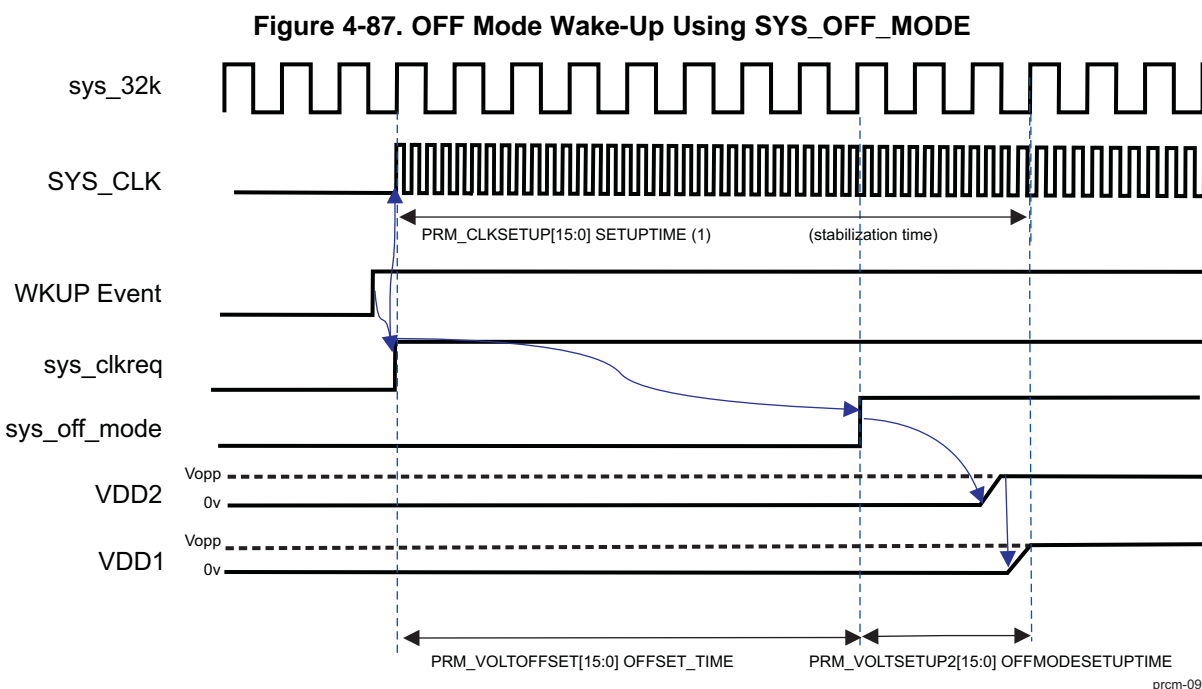

#### 4.12.5.1.2 PRM\_VOLTOFFSET (Voltage Offset Register)

This register allows setting the offset time, which is the time duration between the assertion of sys\_clkreq and the deassertion of sys\_off\_mode when the device is exiting off mode. This time, set as a number of 32-kHz clock cycles, is used to delay the deassertion of sys\_off\_mode (and as a consequence, the

voltage ramping) after the clock has been requested. This is done to avoid waiting for the clock to stabilize when the voltage is already ramped and stabilized, which would induce some leakage. Program this bit field to match the following equation:  $PRM\_VOLTOFFSET[15:0]OFFSET\_TIME = PRM\_CLKSETUP[15:0]SETUPTIME - PRM\_VOLTSETUP2[15:0]OFFMODESETUPTIME$ . This way, the voltages and clock are ready at the same time.

This register is used on device wakeup from off mode when the off sequence is supervised by the power IC.

Figure 4-87 shows off mode wakeup using `SYS_OFF_MODE`.

(1) `PRM_CLKSETUP[15:0] SETUPTIME` is not used during device cold boot-up sequence.

#### 4.12.5.1.3 `PRM_VOLTCTRL` (Voltage Source Control Register)

This register allows control of the power IC. The following are the register bit fields:

- `AUTO_SLEEP`: Automatically sends the sleep command when the voltage domain is in the appropriate standby mode
- `AUTO_RET`: Automatically sends the retention command when the voltage domain is in the appropriate standby mode
- `AUTO_OFF`: Automatically sends the off command when the voltage domain is in the appropriate standby mode
- `SEL_OFF`: Controls whether the off command is sent through the voltage controller I<sup>2</sup>C interface or the signal `sys_off_mode` is asserted when entering off mode
- `SEL_VMODE`: Allows control of the power IC through either the voltage controller I<sup>2</sup>C interface or the `VMODE` interface

#### 4.12.5.2 Voltage Controller Registers

A specific set of registers allows control of the voltage controller. This register set provides programming flexibility to address different power IC device types through an I<sup>2</sup>C interface.

The register set is composed of the following registers:

- Registers to store the addresses on the I<sup>2</sup>C bus:
  - `PRM_VC_SMPS_SA`

- PRM\_VC\_SMPS\_VOL\_RA
- PRM\_VC\_SMPS\_CMD\_RA
- Registers to store the voltage values or voltage commands:
  - PRM\_VC\_CMD\_VAL\_0
  - PRM\_VC\_CMD\_VAL\_1
- Register to configure the VDD channel:
  - PRM\_VC\_CH\_CONF
- Register to configure the I<sup>2</sup>C interface:
  - PRM\_VC\_I2C\_CFG
- Register to use the bypass command:
  - PRM\_VC\_BYPASS\_VAL

#### 4.12.5.2.1 **PRM\_VC\_SMPS\_SA (Voltage Controller SMPS Slave Address Register)**

This register stores the I<sup>2</sup>C slave address value of the power IC device. Two address values can be stored in case two different power IC chips are used to control the two VDD channels (VDD1 and VDD2).

#### 4.12.5.2.2 **PRM\_VC\_SMPS\_VOL\_RA (Voltage Controller SMPS Voltage Register Address Register)**

This register stores the address value of the voltage configuration registers in the power IC device. Two different register address values can be configured.

#### 4.12.5.2.3 **PRM\_VC\_SMPS\_CMD\_RA (Voltage Controller SMPS Command Register Address Register)**

This register stores the address value of the command configuration register in the power IC device. Two different register address values can be configured.

#### 4.12.5.2.4 **PRM\_VC\_CMD\_VAL\_0 and PRM\_VC\_CMD\_VAL\_1 (Voltage Controller Command and Voltage Value Register 0 and 1)**

The voltage controller can store two sets of voltage-level commands for each of the four power states (on, low power, retention, and off) for the power IC. The voltage commands depend on the power IC device used.

#### 4.12.5.2.5 **PRM\_VC\_CH\_CONF (Voltage Controller Channel Configuration Register)**

This register consists of a set of select bits for the VDD1 and VDD2 channels, the slave address, command register address, voltage register address, and voltage-level command settings for power modes (on/low power, on/retention/off). A pair of bit fields can be configured for each of these parameters. The PRM\_VC\_CH\_CONF register allows the allocation of either of the two bit fields (for each of these parameters) to each voltage channel (VDD1 and VDD2). For example, when PRCM.PRM\_VC\_CH\_CONF[0] SA0 = 0x1, the voltage controller allocates PRCM.PRM\_VC\_SMPS\_SA[22:16] SA1 as the slave address for the VDD1 channel. When PRCM.PRM\_VC\_CH\_CONF[0] SA0 = 0x0, the voltage controller allocates PRCM.PRM\_VC\_SMPS\_SA[6:0] SA0 as the slave address for the VDD1 channel.

#### 4.12.5.2.6 **PRM\_VC\_I2C\_CFG (Voltage Controller I<sup>2</sup>C Interface Configuration Register)**

This register allows the setting of the I<sup>2</sup>C interface configuration parameters:

- Master code value when I<sup>2</sup>C interface is used in HS mode
- Enable and disable the HS mode
- Enable and disable the repeated start-operation mode
- Enable and disable the HSMaster mode

#### 4.12.5.2.7 PRM\_VC\_BYPASS\_VAL (Voltage Controller Bypass Command Register)

This register is used to address directly the power IC device through the I<sup>2</sup>C interface. It has the following bit fields:

- SLAVEADDR: Slave address value of the I<sup>2</sup>C interface of the power IC device (similar to PRM\_VC\_SMPS\_SA)
- REGADDR: Address of the command or voltage value register of the power IC device (similar to PRM\_VC\_SMPS\_VOL\_RA or PRM\_VC\_SMPS\_CMD\_RA)
- DATA: Data to be written to the command or voltage value register
- VALID: Voltage command transaction enable and acknowledge bit

### 4.12.6 Generic Programming Examples

#### 4.12.6.1 Clock Control

The module clock management is controlled through three programmable steps:

- Enabling or disabling the functional clocks
- Enabling or disabling the interface clocks
- Enabling or disabling the automatic idle mode for the interface clocks

##### 4.12.6.1.1 Enabling and Disabling the Functional Clocks

The flow chart in [Figure 4-88](#) shows how to enable or disable a functional clock.

The first step before enabling a functional clock is to select the proper source clock using the corresponding clock selection register (CM\_CLKSEL\_<domain\_name>). It can be either an external source clock or an internal clock; that is, sys\_altclk or DPLL4\_M3X2\_CLK for the DSS\_TV\_FCLK functional clock of the DSS.

If the source clock is a DPLL3 or DPLL4 output clock, the DPLL multiplier, divider, and output clock ratios are set in the CM\_CLKSELn\_PLL register, where n is from 1 to 3. The DPLL operating mode is set in the CM\_CLKEN\_PLL register.

The functional clock is enabled or disabled by writing the dedicated bit in the CM\_FCLKEN\_<domain\_name> register. This bit has a direct effect on the clock activity:

- The functional clock is turned on if the bit is enabled and the clock is not yet active.
- The functional clock is turned off if the bit is disabled and the clock is not required by any other module.

Figure 4-88. Functional Clock Basic Programming Model

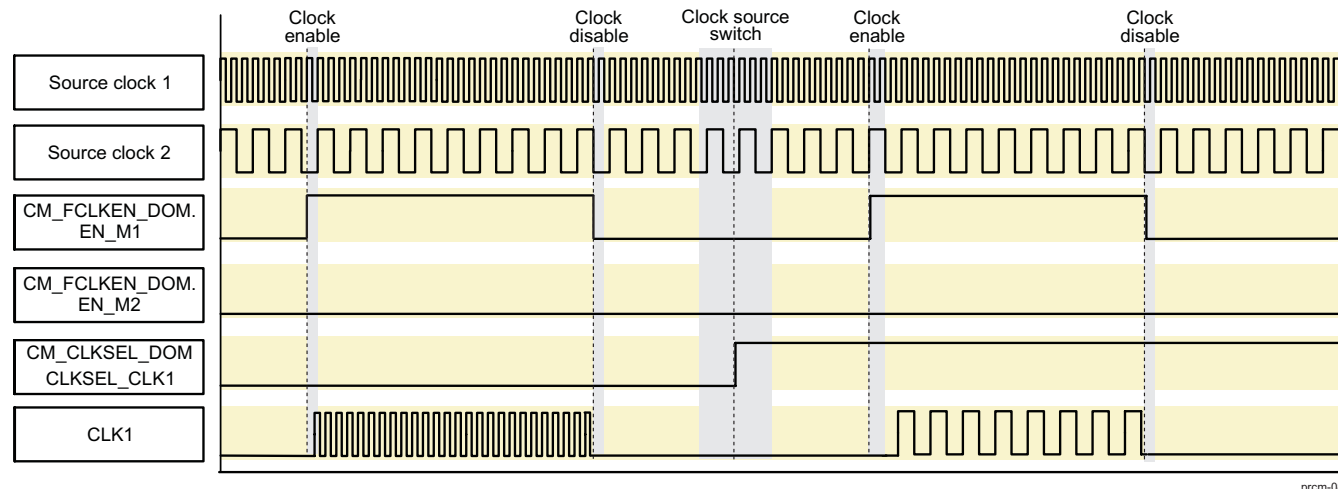

prcm-085

The functional clock must be disabled before switching or scaling its source clock. This means that all the modules using the particular functional clock must not be active during clock switching. To switch a source clock, perform the following sequence:

1. Disable the functional clock by setting the CM\_FCLKEN\_<power domain>EN\_<module> bits to 0.
2. Modify the CM\_CLKSEL\_<power domain>CLKSEL\_<clock> bits to select the new clock source or clock divider.
3. Enable the functional clock by setting the CM\_FCLKEN\_<power domain>EN\_<module> bits to 1.

The timing diagram in Figure 4-89 is a generic example of this sequencing for a functional clock (CLK1). The source clock can be switched between source clock 1 and source clock 2 using the CM\_CLKSEL\_DOM.CLKSEL\_CLK1 bit (source clock 1 is selected when the bit is set to 0; otherwise, source clock 2 is selected). CLK1 can be requested by two modules, M1 and M2. The CM\_FCLKEN\_DOM.EN\_M1 and CM\_FCLKEN\_DOM.EN\_M2 bits control the functional clock enable for the two modules.

**NOTE:** The activation or deactivation of the clock is implementation-dependent, not one cycle of the source clock, as shown in Figure 4-89.

**Figure 4-89. Functional Clock Switching**

prcm-080

The following functional clocks require this switching sequence:

- sys\_clkout2
- 48M\_FCLK (and all gated versions of it)
- 12M\_FCLK (and all gated versions of it)
- DSS\_TV\_CLK
- GPTx\_FCLK (with x = 1, 10, and 11)
- GPTx\_ALWON\_FCLK (with x = 2 up to 9)

#### 4.12.6.1.2 Enabling and Disabling the Interface Clocks

The flow chart in [Figure 4-90](#) shows the enable/disable sequence of the interface clock.

The first step before enabling an interface clock is to select the proper source clock using the corresponding clock selection register (CM\_CLKSEL\_<domain>). This register allows selection of the interconnect frequency (L3\_ICLK, L4\_ICLK) from among several divider ratios.

The interface clock is enabled or disabled by writing the dedicated bit in the CM\_ICLKEN\_<domain> register. This bit has a direct effect on the clock activity:

- The interface clock is turned on if the bit is enabled and the clock is not yet active.
- The interface clock is turned off if the bit is disabled and the clock is not required by any other module.

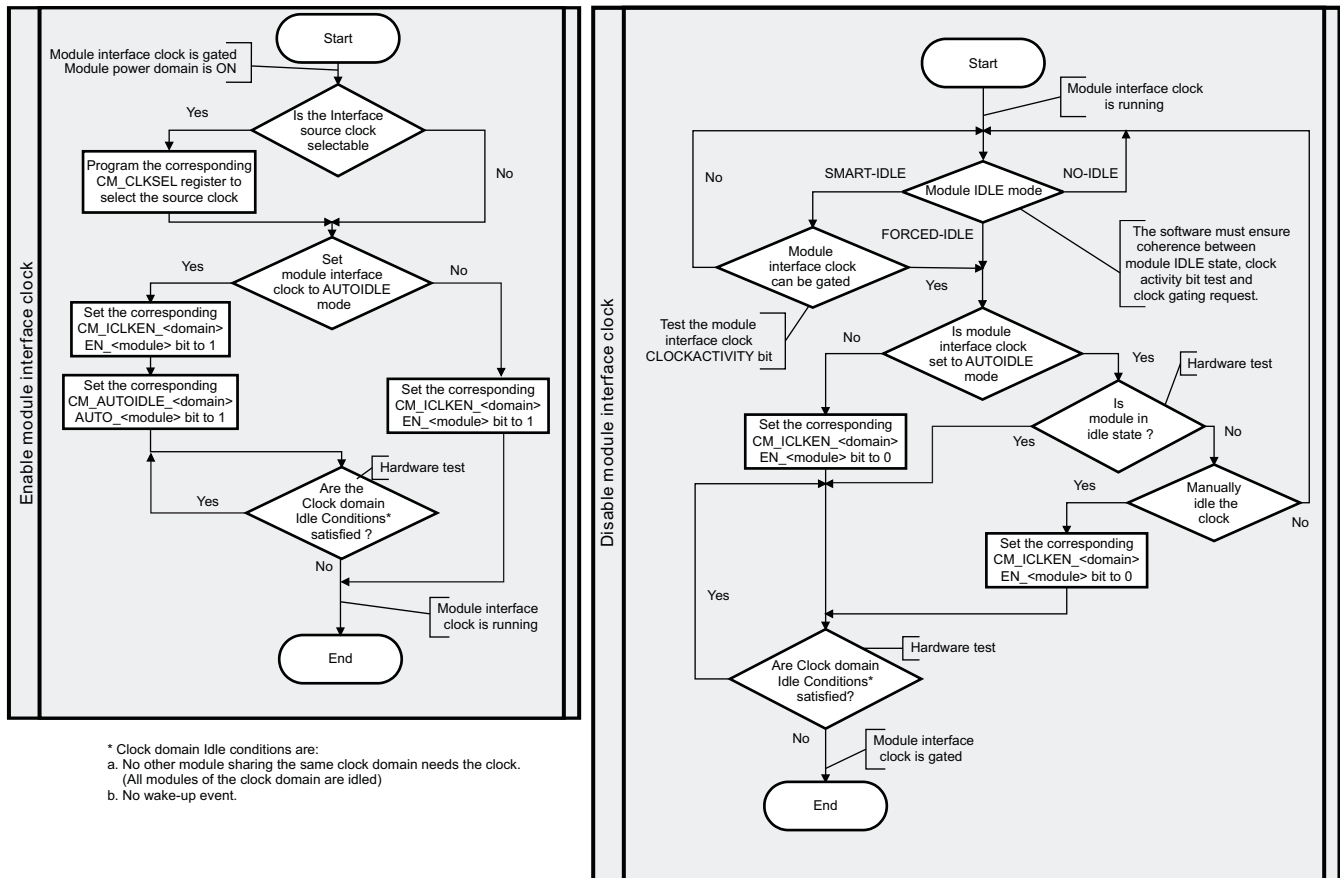

The interface clock can be automatically enabled or disabled by the PRCM, based on hardware conditions. This automatic clock activity control mode is enabled by writing the corresponding bit in the CM\_AUTOIDLE\_<domain > register. It takes effect only if the interface clock is enabled (the corresponding bit in the CM\_ICLKEN\_<domain > is set to 1).

The hardware conditions for automatic gating (deactivation) of the clock are as follows:

- The module activity; that is, the module is inactive.
- The domain activity; that is, all modules in the domain are inactive.

The software can read the idle status register CM\_IDLESTAT\_<domain> at any time to know whether the module is accessible. A module is inaccessible if its idle status bit is set. Accessing an idle module generates an error (if the interface clock is still running) or a time-out (if the interface clock is cut).

Figure 4-90. Interface Clock Basic Programming Model

prcm-086

The frequency ratio between the CORE\_CLK, the L3\_ICLK, and the L4\_ICLK is configured by setting the corresponding CM\_CLKSEL\_CORE register bit fields. This configuration must be done before switching DPLL3 to lock mode. In this way, the clock ratio is switched while DPLL3 is operating at system clock frequency, and then only DPLL3 is switched to high-frequency locked mode.

If the configuration of the interface clock needs to be changed, first put DPLL3 in bypass mode, select the new configuration, and then relock DPLL3.

**NOTE:** When performing frequency scaling, the clock division can be done directly by programming the DPLL output divider. In this case, there is no need to change the configuration of the interface clock.

#### 4.12.6.1.3 Enabling and Disabling the INACTIVE State

The flow chart in Figure 4-91 shows how to put a domain into INACTIVE state. This state is required before any power transition from ON state to RETENTION or OFF state.

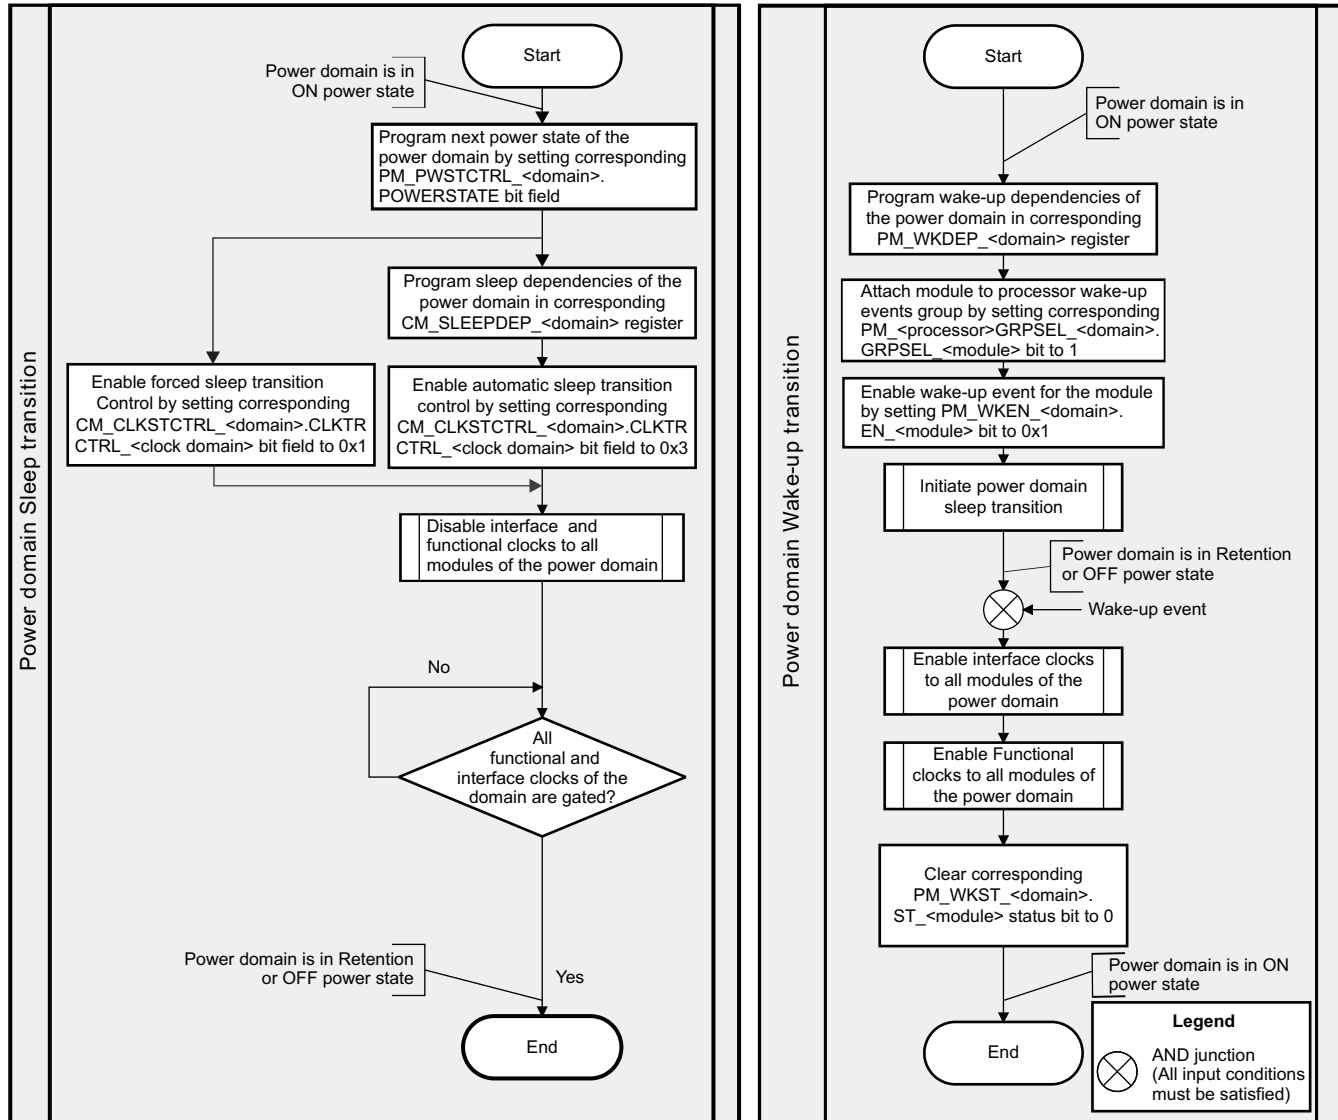

A domain is said to be in INACTIVE state if:

- All the functional and interface clocks of the domain are gated (deactivated).
- All the initiator modules are in standby mode.
- All the dependent domains have reached their mute state. The sleep dependency between the power domains is configured by programming the CM\_SLEEPDEP\_<domain> register.

The domain transition from ACTIVE state to INACTIVE state is effective only if the CM\_CLKSTCTRL\_<domain> register is programmed for hardware-supervised state transition.

The CM\_CLKSTST\_<domain> register identifies whether a power domain or a clock domain within the power domain is accessible. A domain is inaccessible if its corresponding bit in the CM\_CLKSTST\_<domain> register is set to 1.

**Figure 4-91. Domain INACTIVE STATE Basic Programming Model**

prcm-087

**4.12.6.1.4 Processor Clock Control**

The flow chart in Figure 4-92 shows the control sequence of the processor clock.

The processor source clock is generated by the dedicated processor DPLL (DPLL1 and DPLL2). After power up, the processor DPLL is in bypass or stop mode. This means the processor clock is either the system clock or is shut off.

The first step is to program the multiplier and divider ratios of the processor DPLL. Those two values are written in the CM\_CLKSEL1\_PLL\_<processor> register.

For frequency scaling, the processor DPLL integrates an additional divider to scale down the synthesized clock. The value of this second divider is written in the CM\_CLKSEL2\_PLL\_<processor> register. This divider can be configured dynamically (while the processor executes instructions), and the DPLL output clock is scaled without any glitches.

The processor DPLL must be locked at a desired frequency, provided the clock frequency is higher than the system clock. It can then be set to low-power bypass mode when the high-frequency clock is not required. The DPLL operating mode (locked or bypassed) is controlled by programming the `CM_CLKEN_PLL_processor` register.

The processor clock can be switched automatically, based on hardware conditions, between the processor DPLL synthesized clock and a bypass clock. This mode is enabled by programming the corresponding mode in the `CM_AUTOIDLE_PLL_processor` register. It takes effect only if the processor DPLL is locked (the `CM_CLKEN_PLL_processor` register is set in lock mode).

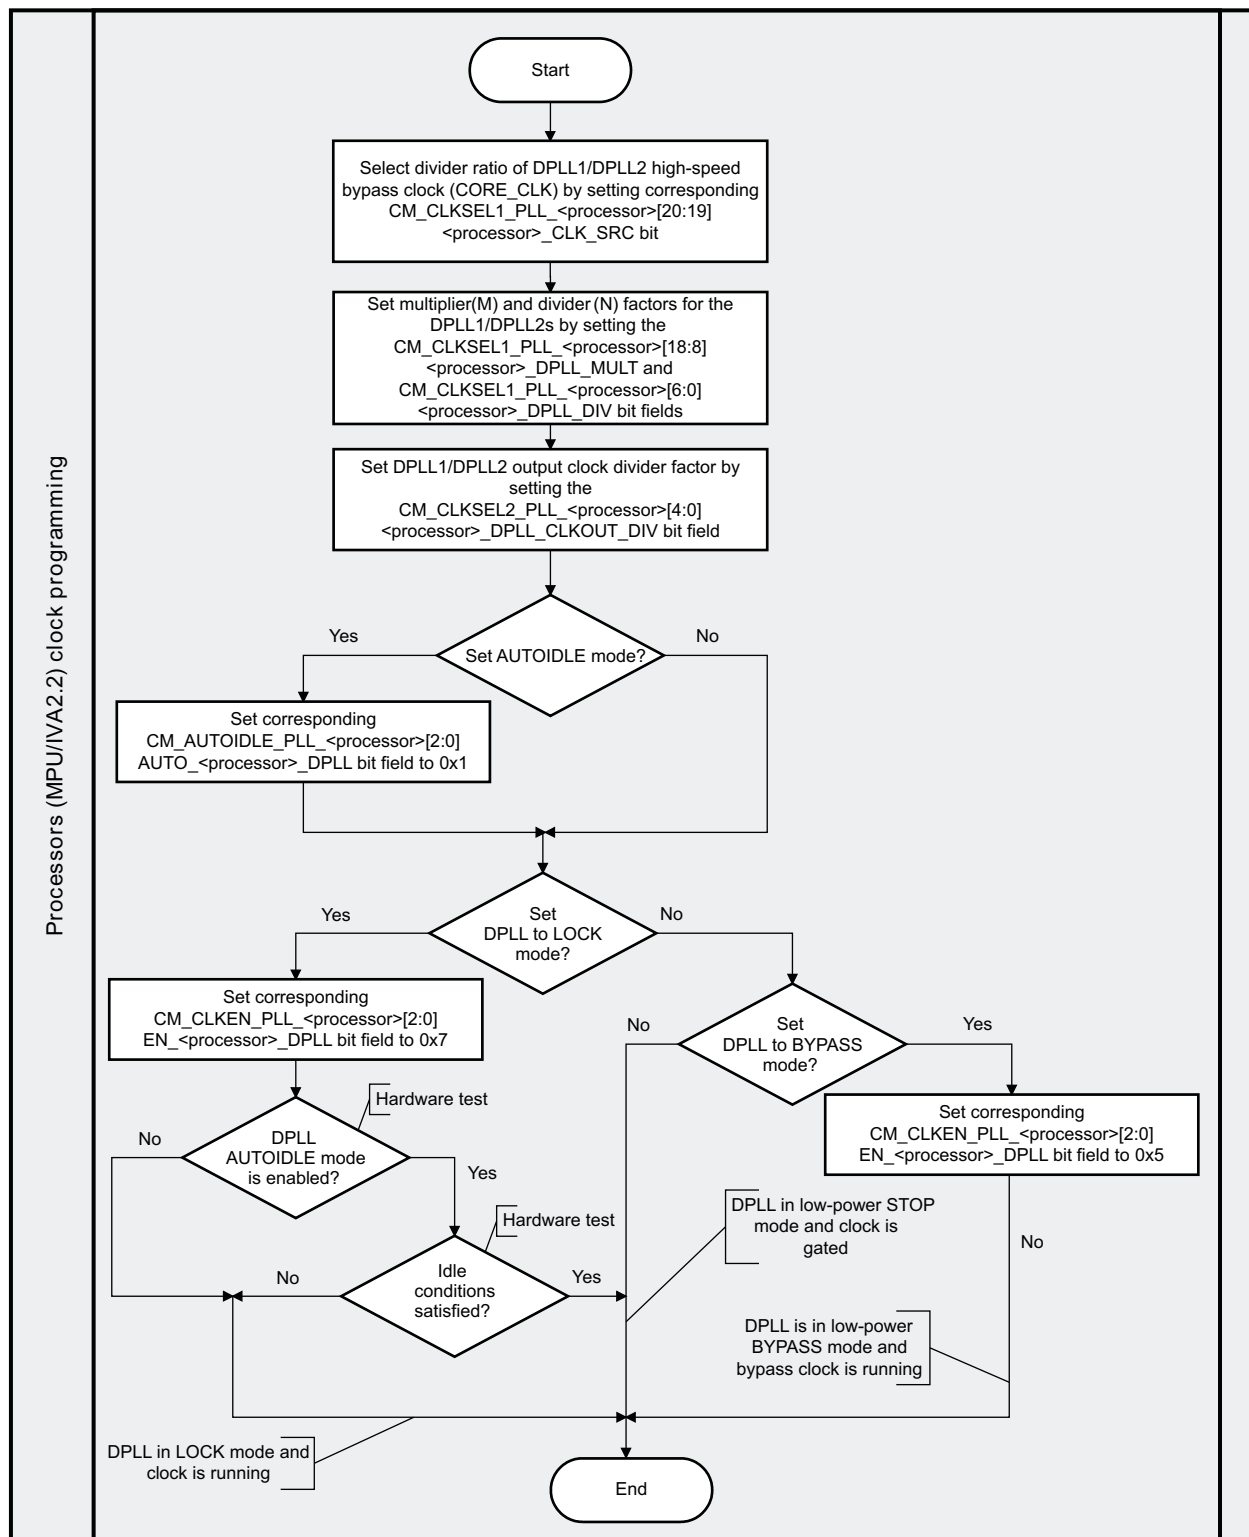

The HS bypass clock for the processor DPLL can be:

- The DPLL3 output clock (`CORE_CLK`)
- The DPLL3 output clock (`CORE_CLK`) divided by 2

The HS bypass clock is selected by programming the `CM_CLKSEL1_PLL_processor` > register.

The software can read the `CM_IDLEST_PLL_<processor >` register at any time to determine whether the DPLL is in lock mode (DPLL output is a high-frequency synthesized clock) or bypass mode (DPLL output is not the synthesized clock; the DPLL output is the bypass clock, or the DPLL is in transitioning state).

Figure 4-92. Processor Clock Basic Programming Model

prcm-088

#### 4.12.6.2 Reset Management

The reset sequence is hardware-driven. On power on, once all the reset sources have been released, the PRM holds the entire device under reset long enough to ensure the stabilization of the power IC voltages and the oscillator system clock frequency. This reset delay is programmed in the PRM\_RSTTIME register.

The IVA2.2 domain resets are held active after power up. They are released by writing to the corresponding bits in the RM\_RSTCTRL\_<domain> register.

A domain reset status register (PRM\_RSTST\_<domain>) identifies the source of the current reset applied to the domain. The software must clear this status bit after reset.

A global reset status register (PRM\_RSTST) provides information on the global source of resets. All sources of warm reset are logged separately in this register, and all sources of cold reset are logged in a common status bit.

#### 4.12.6.3 Wake-Up Control

The flow chart in [Figure 4-93](#) shows the control sequence of the module wake-up event.

This procedure consists of the following steps:

1. Program the PRCM to consider the wake-up event.
2. Switch to idle mode and wait for the wake-up event.
3. Wake up on the wake-up event and activate the module functional clock.
4. Acknowledge the wake-up event.

The peripheral that can generate a wake-up event must be attached to a group of wake-up event generating modules for one or both processors by programming the PM\_<processor>GRPSEL register. Writing 1 to this register allows the corresponding processor to be wakened on a peripheral wake-up event, assuming that the peripheral wake-up capability has been enabled by programming the register PM\_WKEN\_<domain>.

After this is configured, the PRCM initiates a wake-up procedure on receiving the peripheral wake-up event. The peripheral functional clock must be reenabled by programming the CM\_FCLKEN\_<domain > register, and then the wake-up event can be acknowledged by clearing the PM\_WKST\_<domain > register.

Figure 4-93. Wake-Up Basic Programming Model

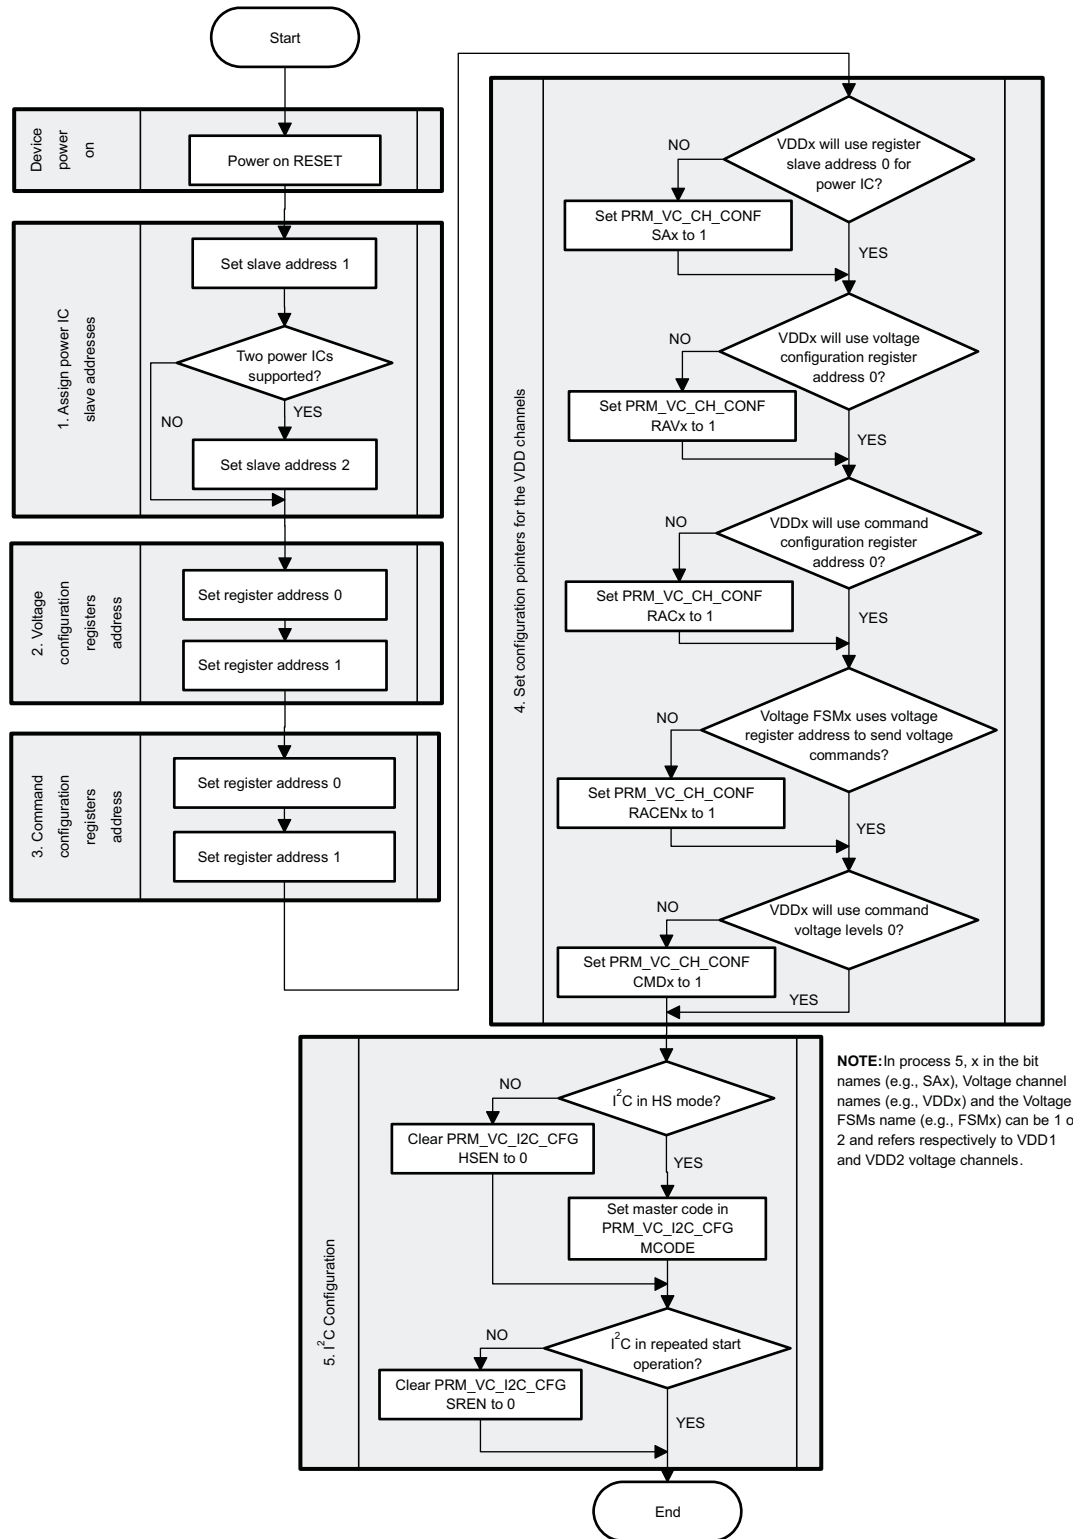

prcm-084

A power domain A can have a functional dependency on a power domain B. Thus, when power domain A wakes up, it may be necessary to wake up power domain B. This wake-up dependency is hardcoded for the CORE power domain, but is programmable for the other power domains through the PM\_WKDEP\_<domain> register.

4.12.6.4 Voltage Controller Initialization Basic Programming Model

Figure 4-94 is the flow chart for voltage controller initialization.

Figure 4-94. Voltage Controller Initialization Flow Chart

NOTE: In process 5, x in the bit names (e.g., SAX), Voltage channel names (e.g., VDDx) and the Voltage FSMs name (e.g., FSMx) can be 1 or 2 and refers respectively to VDD1 and VDD2 voltage channels.

prcm-UC-008

1. Assign power IC slave addresses.

To support the I<sup>2</sup>C communication with external power ICs, the slave address of the power ICs must be configured in the voltage controller registers. The voltage controller can support two slave addresses to control VDD1 and VDD2 independently, from two different power ICs. At least one valid slave address is required to communicate with a power IC.

**NOTE:** The slave address for the following depends on the configured slave address of the power IC:

- PRCM.PRM\_VC\_SMPS\_SA[6:0] SA0
- PRCM.PRM\_VC\_SMPS\_SA[22:16] SA1

## 2. Set voltage configuration register addresses.

The addresses of the voltage configuration registers of the power ICs are set in the corresponding bit fields. The voltage controller can support addresses of two different voltage configuration registers (belonging to same or different power ICs).

PRCM.PRM_VC_SMPS_VOL_RA[7:0] VOLRA0		Depend on the characteristics of the connected power ICs.
PRCM.PRM_VC_SMPS_VOL_RA[23:16] VOLRA1		

## 3. Set command configuration register addresses.

The addresses of the command configuration registers of the power ICs are set in the corresponding bit fields. The voltage controller can support addresses of two different command configuration registers (belonging to same or different power ICs).

PRCM.PRM_VC_SMPS_CMD_RA[7:0] CMDRA0		Depend on the characteristics of the connected power ICs.
PRCM.PRM_VC_SMPS_CMD_RA[23:16] CMDRA1		

## 4. Set configuration pointers for the VDD channels.

The configuration pointers allow the selection of one of four configurations for each voltage channel (VDD1 and VDD2):

- Two slave I<sup>2</sup>C interfaces (slave address)
- Two voltage configuration registers
- Two command configuration registers
- Two power-mode voltage levels

PRCM.PRM_VC_CH_CONF[16] SA1		Slave address pointer (SA1 for VDD2, and SA0 for VDD1)
PRCM.PRM_VC_CH_CONF[0] SA0		
PRCM.PRM_VC_CH_CONF[17] RAV1		Voltage configuration register address pointer (RAV1 for VDD2, and RAV0 for VDD1)
PRCM.PRM_VC_CH_CONF[1] RAV0		
PRCM.PRM_VC_CH_CONF[18] RAC1		Command configuration register address pointer (RAC1 for VDD2, and RAC0 for VDD1)
PRCM.PRM_VC_CH_CONF[2] RAC0		
PRCM.PRM_VC_CH_CONF[19] RACEN1		Select voltage or command configuration register for FSM commands (RACEN1 for VDD2, and RACEN0 for VDD1)
PRCM.PRM_VC_CH_CONF[3] RACEN0		
PRCM.PRM_VC_CH_CONF[20] CMD1		Command voltage level selection pointer (CMD1 for VDD2, and CMD0 for VDD1)
PRCM.PRM_VC_CH_CONF[4] CMD0		

## 5. Configure I<sup>2</sup>C.

At power-on reset, the I<sup>2</sup>C4 is in HS mode. In HS mode, a master code value must be configured for the preamble I<sup>2</sup>C HS transmission. If the external power ICs do not support I<sup>2</sup>C HS mode, the interface can be switched to fast/standard (F/S) mode. By default, a repeated-start operation for communication is enabled. If necessary, it can be disabled.

For more information, see the *Inter-Integrated Circuit (I<sup>2</sup>C)* chapter.

PRCM.PRM_VC_I2C_CFG[2:0] MCODE		Master code for I <sup>2</sup> C HS preamble
PRCM.PRM_VC_I2C_CFG[3] HSEN	0x0	Switch to F/S mode.
PRCM.PRM_VC_CH_CONF[4] SREN	0x0	Disable repeated start operation.

#### 4.12.6.5 Event Generator Programming Examples

The event generator feature allows the MPU power domain to be switched between on and off (or placed in idled mode). This is intended to implement an efficient activity modulation of the MPU power state with minimum software support.

When the event generator is activated, the PRCM ensures that the CORE power domain always follows the MPU power domain activity.

The PRCM.PM\_EVGENONTIM\_MPU and PRCM.PM\_EVGENOFFTIM\_MPU registers of the event generator counter allow the configuration of the on and off durations (the number of system clock cycles) for the MPU power domain. The PRCM.PM\_EVGENCTRL\_MPU register allows the enabling/disabling of the event generator feature and control of the way on and off values are loaded in the counter.

There are three ways to load the counter with the next counting value:

- Load on update of the corresponding PRCM.PM\_EVGENONTIM\_MPU or PRCM.PM\_EVGENOFFTIM\_MPU register.
- Load the on-time value when the MPU power domain wakes up, and the off-time value when the MPU power domain starts the sleep transition (the MPU executes the WFI instruction).
- Automatically load the on-time value when the off-time value expires, and automatically load the off-time value when the on-time value expires.

When the counter times out at the end of the on/off time, it triggers the interrupt/wake-up transition, respectively. The software can use the on-time interrupt to trigger the WFI processor instruction to idle the processor clock. Similarly, the wake-up event at the end of the off time restarts the processor clock and interrupts the processor. To enable the corresponding interrupts, the MPU interrupts mask must be set in the PRCM.PRM\_IRQENABLE\_MPU register.

## 4.13 PRCM Use Cases and Tips

### 4.13.1 Voltage Control Using VMODE

#### 4.13.1.1 Introduction

The PRCM allows direct simple control of VDD1 and VDD2 through the dedicated signals `sys_nvmode1` and `sys_nvmode2`. A single voltage value can be linked in the external power IC to a given state of `sys_nvmode1` or `sys_nvmode2`. This allows direct voltage management (see [Table 4-92](#)).

**Table 4-92. VDD1 and VDD2 Voltage Control Through VMODE**

sys_nvmode Signals	Voltage Values	Comments
sys_nvmode1 is high.	VDD1 value 1	VDD1 value 1 depends on the power IC programming.
sys_nvmode1 is low.	VDD1 value 2	VDD1 value 2 depends on the power IC programming.
sys_nvmode2 is high.	VDD2 value 1	VDD2 value 1 depends on the power IC programming.
sys_nvmode2 is low.	VDD2 value 2	VDD2 value 2 depends on the power IC programming.

**NOTE:** The polarity of `sys_nvmode1` and `sys_nvmode2` is programmable. This means that the PRCM sets them high or low, depending on the user settings. For this reason, the external power IC must be configured to provide a given voltage level depending on the states of the `sys_nvmodex` signals.

Assertion of `sys_nvmode1` and `sys_nvmode2` (low or high, depending on the chosen polarity) occurs immediately after a device sleep or wake-up transition. When the PRCM triggers a sleep transition (on to off, or on to retention), it de-asserts `sys_nvmode1` and `sys_nvmode2`. When the PRCM detects a device wake-up transition (retention to on, or off to on), it asserts `sys_nvmode1` and `sys_nvmode2`.

**NOTE:** `sys_nvmode1` and `sys_nvmode2` are managed as one signal from the PRCM standpoint. In other words, their settings and assertion conditions are managed globally, without any granularity. The power IC software sets different values for VDD1 and VDD2, if necessary.

From the PRCM standpoint, using the VMODE signals is mutually exclusive with using the dedicated I2C4 interface to the external power IC; `sys_nvmodex` signals share the same physical interface as I2C4 at device boundary.

Using VMODE voltage control is an easy way to switch VDD1 and VDD2 voltage values upon device power state transitions. The following section gives the programming steps to achieve voltage management through VMODE signals.

#### 4.13.1.2 Programming Sequence

##### 4.13.1.2.1 Initialization Procedure

1. Configure `sys_nvmode1` and `sys_nvmode2` at the device level.

CONTROL.CONTROL_PADCONF_I2C4_SCL[15:0]	Mux mode1
CONTROL.CONTROL_PADCONF_I2C4_SCL[31:16]	Mux mode1

The correct multiplexing mode is selected at the device level to select `sys_nvmode1` and `sys_nvmode2` on the balls. This is done in the SCM registers, as indicated. For further details, see the *System Control Module* chapter.

2. Activate VMODE control.

PRM_VOLTCTRL[4] SEL_VMODE	0x1
---------------------------	-----

VMODE control is selected in the PRCM. This also ensures the other interfaces to the power IC are correctly deactivated and managed.

- Set the polarity of sys\_nvmode1 and sys\_nvmode2.

PRM_POLCTRL[0] EXTVOL_POL	0x1 => sys_nvmodex signals are active high
---------------------------	--

Depending on the polarity set, the VMODE signals remain high or low until a transition is initiated. Their states then automatically toggle to the opposite state and return when the reverse transition is initiated.

- Set the voltage stabilization delays.

PRM_VOLTSETUP1[31:16] SETUP_TIME2	VDD2 voltage stabilization time
PRM_VOLTSETUP1[15:0] SETUP_TIME1	VDD1 voltage stabilization time

SETUP\_TIME1 and SETUP\_TIME2 are power IC-dependent parameters for voltage stabilization time for VDD1 and VDD2, respectively. For further details, see the power IC documentation.

- Configure the power IC.

This step relies entirely on power IC software settings. The purpose here is to link a voltage value to both VDD1 and VDD2 depending on the state of the sys\_nvmodex signals. For further details, see the power IC documentation.

#### **4.13.1.2.2 VMODE Signals Toggling**

- Has a sleep/wake-up transition been initiated?

As stated previously, when VMODE voltage control is selected, the PRCM automatically toggles sys\_nvmodex signals and device sleep and wake-up transitions. This means the user has nothing more to control except the device transitions, as explained in this document. When a transition is initiated, sys\_nvmode1 and sys\_nvmode2 toggle according to their programmed polarity and alert the power IC to switch VDD1 and VDD2 to the programmed values.

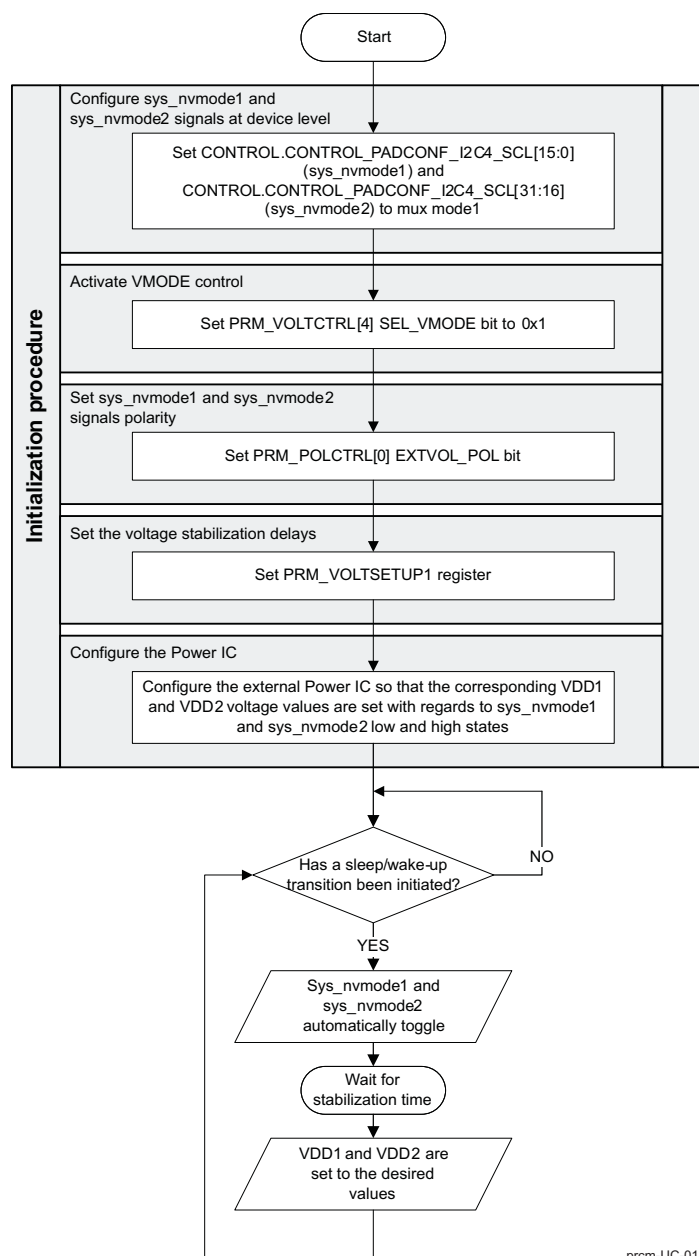

- Wait for stabilization time.

Depending on the SETUP\_TIME1 and SETUP\_TIME2 settings, the PRCM starts a countdown immediately after the VMODE signal state changes. This ensures that the voltages provided by the power IC are stable before switching the device to the desired power state.

### 4.13.1.2.3 Summary Flow Chart

Figure 4-95 is a flow chart of VMODE voltage control.

Figure 4-95. Voltage Control through VMODE Flow Chart

## 4.14 PRCM Registers

This section gives information about all modules and features in the high-tier device. See Chapter 1, *OMAP35x Family* section, to check availability of modules and features. For power-management saving consideration, ensure that power domains of unavailable features and modules are switched off and clocks are cut off.

[Table 4-93](#) lists the physical addresses of the CM modules. [Table 4-94](#) through [Table 4-107](#) provide register mapping summaries of the CM registers and describe the bits in the individual registers.

[Table 4-204](#) lists the physical addresses of the PRM modules. [Table 4-205](#) through [Table 4-210](#) provide register mapping summaries of the PRM registers and describe the bits in the individual registers.

### 4.14.1.2 IVA2\_CM Register Descriptions

#### 4.14.1.2.1 CM\_FCLKEN\_IVA2

**Table 4-108. CM\_FCLKEN\_IVA2**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	IVA2_CM
<b>Physical Address</b>	0x4800 4000		
<b>Description</b>	This register controls the IVA2 domain functional clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															EN_IVA2

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	EN_IVA2	IVA2 functional clock control 0x0: IVA2_CLK is disabled 0x1: IVA2_CLK is enabled	RW	0x0

4.14.1.2.2 CM\_CLKEN\_PLL\_IVA2

Table 4-109. CM\_CLKEN\_PLL\_IVA2

<b>Address Offset</b>	0x0000 0004	<b>Instance</b>	IVA2_CM
<b>Physical Address</b>	0x4800 4004		
<b>Description</b>	This register allows controlling the IVA2 DPLL modes.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_IVA2_DPLL_LPMODE	IVA2_DPLL_RAMPTIME	IVA2_DPLL_FREQSEL			EN_IVA2_DPLL_DRIFTGUARD	EN_IVA2_DPLL									

Bits	Field Name	Description	Type	Reset
31:11	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
10	EN_IVA2_DPLL_LPMODE	This bit allows to enable or disable the LP mode of the IVA2 DPLL. Writing this bit to switch the mode between LP or normal mode will take effect only when the DPLL will have transition into the bypass or stop state, followed by a lock or re-lock of the DPLL.  0x0: Disables the DPLL LP mode to re-enter the normal mode at the following lock or re-lock sequence.  0x1: Enables the DPLL LP mode to enter the LP mode at the following lock or re-lock sequence.	RW	0x0
9:8	IVA2_DPLL_RAMPTIME	The DPLL provides an output clock frequency ramping feature when switching from bypass clock to normal clock during lock and relock. The frequency ramping occurs in a maximum of four steps in frequency before the DPLL frequency lock indicator is asserted. The ramp step size is specified in the number of DPLL internal reference clock cycles. The internal DPLL reference clock cycle is given by: $F_{int} = \text{DPLL input reference clock frequency} / (N + 1)$ , where N is the value in the CM_CLKSEL1_PLL_IVA2[8:2] IVA2_DPLL_DIV bit field. This register is used to enable and disable the DPLL ramping feature. If enabled, it is also used to select a range of ramp step sizes. The step size used per range depends on the DPLL internal reference clock frequency: the lower the frequency, the smaller the ramp step size.  0x0: Disables the frequency ramping feature. 0x1: Ramp step size range is 2–40 Fint cycles. 0x2: Ramp step size range is 4–80 Fint cycles. 0x3: Ramp step size range is 12–240 Fint cycles.	RW	0x0

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
7:4	IVA2_DPLL_FREQSEL	<p>This bit field allows selecting the proper range of the IVA2 DPLL internal frequency depending on the DPLL reference clock and the N divider.</p> <p>0x3: 0.75 MHz—1.0 MHz  0x4: 1.0 MHz—1.25 MHz  0x5: 1.25 MHz—1.5 MHz  0x6: 1.5 MHz—1.75 MHz  0x7: 1.75 MHz—2.1 MHz  0xB: 7.5 MHz—10 MHz  0xC: 10 MHz—12.5 MHz  0xD: 12.5 MHz—15 MHz  0xE: 15 MHz—17.5 MHz  0xF: 17.5 MHz—21 MHz</p>	RW	0x1
3	EN_IVA2_DPLL_DRIFTGUARD	<p>This bit allows to enable or disable the automatic recalibration feature of the IVA2 DPLL. The IVA2 DPLL will automatically start a recalibration process upon assertion of the recal flag if this bit is set.</p> <p>0x0: Disables the IVA2 DPLL automatic recalibration mode  0x1: Enables the IVA2 DPLL automatic recalibration mode</p>	RW	0x0
2:0	EN_IVA2_DPLL	<p>IVA2 DPLL control; Other enums: Reserved</p> <p>0x1: Put the IVA2 DPLL in low power stop mode  0x5: Put the IVA2 DPLL in low power bypass mode  0x7: Enables the IVA2 DPLL in lock mode</p>	RW	0x1

#### 4.14.1.2.3 CM\_IDLEST\_IVA2

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reads returns 0.	R	0x000000
7:0	REV	IP revision [7:4] Major revision [3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1	R	0x10

#### 4.14.1.3.2 CM\_SYSCONFIG

**Table 4-118. CM\_SYSCONFIG**

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	OCP_System_Reg_CM
<b>Physical Address</b>	0x4800 4810		
<b>Description</b>	This register controls the various parameters of the interface clock		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																	AUTOIDLE														

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Reads returns 0.	R	0x00000000
0	AUTOIDLE	Internal clock gating strategy (for the CM part of the PRCM) 0x0: Interface clock is free-running 0x1: Automatic clock gating strategy is enabled, based on the interface activity.	RW	0x1

#### 4.14.1.4 MPU\_CM Register Descriptions

##### 4.14.1.4.1 CM\_CLKEN\_PLL\_MPU

**Table 4-119. CM\_CLKEN\_PLL\_MPU**

<b>Address Offset</b>	0x0000 0004	<b>Instance</b>	MPU_CM
<b>Physical Address</b>	0x4800 4904		
<b>Description</b>	This register allows controlling the DPLL1 modes.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_MPU_DPLL_LP_MODE		MPU_DPLL_RAMPTIME		MPU_DPLL_FREQSEL				EN_MPU_DPLL_DRIFTGUARD		EN_MPU_DPLL					

Bits	Field Name	Description	Type	Reset
31:11	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000000
10	EN_MPU_DPLL_LP_MODE	<p>This bit allows to enable or disable the LP mode of the MPU DPLL. Writing this bit to switch the mode between LP or normal mode will take effect only when the DPLL will have transition into the bypass or stop state, followed by a lock or re-lock of the DPLL.</p> <p>0x0: Disables the DPLL LP mode to re-enter the normal mode at the following lock or re-lock sequence.</p> <p>0x1: Enables the DPLL LP mode to enter the LP mode at the following lock or re-lock sequence.</p>	RW	0x0
9:8	MPU_DPLL_RAMPTIME	<p>The DPLL provides an output clock frequency ramping feature when switching from bypass clock to normal clock during lock and relock. The frequency ramping occurs in a maximum of four steps in frequency before the DPLL frequency lock indicator is asserted. The ramp step size is specified in the number of DPLL internal reference clock cycles. The internal DPLL reference clock cycle is given by: <math>F_{int} = \text{DPLL input reference clock frequency} / (N + 1)</math>, where N is the value in the CM_CLKSEL1_PLL_MPU[6:0] MPU_DPLL_DIV bit field. This register is used to enable and disable the DPLL ramping feature. If enabled, it is also used to select a range of ramp step sizes. The step size used per range depends on the DPLL internal reference clock frequency: the lower the frequency, the smaller the ramp step size.</p> <p>0x0: Disables the frequency ramping feature.</p> <p>0x1: Ramp step size range is 2–40 Fint cycles.</p> <p>0x2: Ramp step size range is 4–80 Fint cycles.</p> <p>0x3: Ramp step size range is 12–240 Fint cycles.</p>	RW	0x0

Bits	Field Name	Description	Type	Reset
7:4	MPU_DPLL_FREQSEL	<p>This bit field allows selecting the proper range of the DPLL1 internal frequency depending on the DPLL reference clock and the N divider.</p> <p>0x3: 0.75 MHz—1.0 MHz            0x4: 1.0 MHz—1.25 MHz            0x5: 1.25 MHz—1.5 MHz            0x6: 1.5 MHz—1.75 MHz            0x7: 1.75 MHz—2.1 MHz            0xB: 7.5 MHz—10 MHz            0xC: 10 MHz—12.5 MHz            0xD: 12.5 MHz—15 MHz            0xE: 15 MHz—17.5 MHz            0xF: 17.5 MHz—21 MHz</p>	RW	0x1
3	EN_MPU_DPLL_DRIFTGUARD	<p>This bit allows to enable or disable the automatic recalibration feature of the MPU DPLL. The DPLL1 will automatically start a recalibration process upon assertion of the recal flag if this bit is set.</p> <p>0x0: Disables the DPLL1 automatic recalibration mode            0x1: Enables the DPLL1 automatic recalibration mode</p>	RW	0x0
2:0	EN_MPU_DPLL	<p>DPLL1 control; Other enums: Reserved</p> <p>0x5: Put the DPLL1 in low power bypass mode            0x7: Enables the DPLL1 in lock mode</p>	RW	0x5

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
5:4	CLKTRCTRL_D2D	Controls the clock state transition of the D2D clock domain. 0x0: Automatic transition disabled. 0x1: Start a software supervised sleep transition on the domain. 0x2: Start a software supervised wakeup transition on the domain. 0x3: Automatic transition is enabled. Transition is supervised by the Hardware.	RW	0x0
3:2	CLKTRCTRL_L4	Controls the clock state transition of the L4 clock domain. 0x0: Automatic transition is disabled 0x1: Reserved 0x2: Reserved 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x0
1:0	CLKTRCTRL_L3	Controls the clock state transition of the L3 clock domain. 0x0: Automatic transition is disabled 0x1: Reserved 0x2: Reserved 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x0

### 4.14.1.6 SGX\_CM Register Descriptions

#### 4.14.1.6.1 CM\_FCLKEN\_SGX

**Table 4-141. CM\_FCLKEN\_SGX**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	SGX_CM
<b>Physical Address</b>	0x4800 4B00		
<b>Description</b>	Controls the Graphic engine functional clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_SGX		RESERVED													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1	EN_SGX	SGX functional clock enable 0x0: SGX_FCLK is disabled 0x1: SGX_FCLK is enabled	RW	0x0
0	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

#### 4.14.1.6.2 CM\_ICLKEN\_SGX

**Table 4-142. CM\_ICLKEN\_SGX**

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	SGX_CM
<b>Physical Address</b>	0x4800 4B10		
<b>Description</b>	Controls the Graphic engine interface clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_SGX															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	EN_SGX	SGX interface clock control 0x0: SGX_L3_ICLK is disabled 0x1: SGX_L3_ICLK is enabled	RW	0x0

**4.14.1.6.3 CM\_IDLEST\_SGX**
**Table 4-143. CM\_IDLEST\_SGX**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	SGX_CM
<b>Physical Address</b>	0x4800 4B20		
<b>Description</b>	SGX standby status. This register is read only and automatically updated.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ST_SGX															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Read returns 0	R	0x00000000
0	ST_SGX	SGX standby status. 0x0: SGX subsystem is active. 0x1: SGX subsystem is in standby mode.	R	0x1

**4.14.1.6.4 CM\_CLKSEL\_SGX**
**Table 4-144. CM\_CLKSEL\_SGX**

<b>Address Offset</b>	0x0000 0040	<b>Instance</b>	SGX_CM
<b>Physical Address</b>	0x4800 4B40		
<b>Description</b>	SGX clock selection.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKSEL_SGX															

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Write 0's for future compatibility. Read return 0.	R	0x00000000
2:0	CLKSEL_SGX	Selects SGX functional clock; Other enums: Reserved. See device specific Data Manual for more details. 0x0: SGX_FCLK is CORE_CLK divided by 3 0x1: SGX_FCLK is CORE_CLK divided by 4 0x2: SGX_FCLK is CORE_CLK divided by 6 0x3: SGX_FCLK clock is CM_96M_FCLK clock	RW	0x0

**4.14.1.6.5 CM\_SLEEPDEP\_SGX**
**Table 4-145. CM\_SLEEPDEP\_SGX**

<b>Address Offset</b>	0x0000 0044		
<b>Physical Address</b>	0x4800 4B44	<b>Instance</b>	SGX_CM
<b>Description</b>	This register allows enabling or disabling the sleep transition dependency of SGX domain with respect to other domain.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_MPU		RESERVED													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1	EN_MPU	MPU domain dependency 0x0: SGX domain sleep dependency with MPU domain is disabled. 0x1: SGX domain sleep dependency with MPU domain is enabled.	RW	0x0
0	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

**4.14.1.6.6 CM\_CLKSTCTRL\_SGX**
**Table 4-146. CM\_CLKSTCTRL\_SGX**

<b>Address Offset</b>	0x0000 0048		
<b>Physical Address</b>	0x4800 4B48	<b>Instance</b>	SGX_CM
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ACTIVE and INACTIVE states.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKTRCTRL_SGX															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Reads returns 0.	R	0x00000000
1:0	CLKTRCTRL_SGX	Controls the clock state transition of the SGX clock domain. 0x0: Automatic transition is disabled 0x1: Start a software supervised sleep transition on the domain 0x2: Start a software supervised wake-up transition on the domain 0x3: Automatic transition is enabled. Transition is supervised by the hardware. <b>NOTE:</b> This mode must not be used when smart-standby is enabled.	RW	0x0

**4.14.1.6.7 CM\_CLKSTST\_SGX**
**Table 4-147. CM\_CLKSTST\_SGX**

<b>Address Offset</b>	0x0000 004C		
<b>Physical Address</b>	0x4800 4B4C	<b>Instance</b>	SGX_CM
<b>Description</b>	This register provides a status on the interface clock activity in the domain.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKACTIVITY_SGX															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	CLKACTIVITY_SGX	Interface clock activity status 0x0: No domain interface clock activity 0x1: Domain interface clock is active	R	0x0

### 4.14.1.7 WKUP\_CM Register Descriptions

#### 4.14.1.7.1 CM\_FCLKEN\_WKUP

**Table 4-148. CM\_FCLKEN\_WKUP**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	WKUP_CM
<b>Physical Address</b>	0x4800 4C00		
<b>Description</b>	Controls the modules functional clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31	PWRDN_EMU_PERIPH	This bit allows to power-down or not the DPPLL4_M6X2_CLK HSDIVIDER path. 0x0: Power-up the DPPLL4_M6X2_CLK HSDIVIDER path. 0x1: Power-down the DPPLL4_M6X2_CLK HSDIVIDER path. Writing this bit to 1 will take effect immediately.	RW	0x0
30	PWRDN_CAM	This bit allows to power-down or not the DPPLL4_M5X2_CLK HSDIVIDER path. 0x0: Power-up the DPPLL4_M5X2_CLK HSDIVIDER path. 0x1: Power-down the DPPLL4_M5X2_CLK HSDIVIDER path. Writing this bit to 1 will take effect immediately.	RW	0x0
29	PWRDN_DSS1	This bit allows to power-down or not the DPPLL4_M4X2_CLK HSDIVIDER path. 0x0: Power-up the DPPLL4_M4X2_CLK HSDIVIDER path. 0x1: Power-down the DPPLL4_M4X2_CLK HSDIVIDER path. Writing this bit to 1 will take effect immediately.	RW	0x0
28	PWRDN_TV	This bit allows to power-down or not the DPPLL4_M3X2_CLK HSDIVIDER path. 0x0: Power-up the DPPLL4_M3X2_CLK HSDIVIDER path. 0x1: Power-down the DPPLL4_M3X2_CLK HSDIVIDER path. Writing this bit to 1 will take effect immediately.	RW	0x0
27	PWRDN_96M	This bit allows to power-down or not the DPPLL4_M2X2_CLK path. 0x0: Power-up the DPPLL4_M2X2_CLK path. 0x1: Power-down the DPPLL4_M2X2_CLK path. Writing this bit to 1 will take effect immediately.	RW	0x0

Bits	Field Name	Description	Type	Reset
26	EN_PERIPH_DPLL_LP_MODE	<p>This bit allows to enable or disable the LP mode of the DPLL4. Writing this bit to switch the mode between LP or normal mode will take effect only when the DPLL will have transition into the bypass or stop state, followed by a lock or re-lock of the DPLL.</p> <p>0x0: Disables the DPLL LP mode to re-enter the normal mode at the following lock or re-lock sequence.</p> <p>0x1: Enables the DPLL LP mode to enter the LP mode at the following lock or re-lock sequence.</p>	RW	0x0
25:24	PERIPH_DPLL_RAMPTIME	<p>The DPLL provides an output clock frequency ramping feature when switching from bypass clock to normal clock during lock and relock. The frequency ramping occurs in a maximum of four steps in frequency before the DPLL frequency lock indicator is asserted. The ramp step size is specified in the number of DPLL internal reference clock cycles. The internal DPLL reference clock cycle is given by: <math>F_{int} = \text{DPLL input reference clock frequency} / (N + 1)</math>, where N is the value in the CM_CLKSEL2_PLL[6:0] PERIPH_DPLL_DIV bit field. This register is used to enable and disable the DPLL ramping feature. If enabled, it is also used to select a range of ramp step sizes. The step size used per range depends on the DPLL internal reference clock frequency: the lower the frequency, the smaller the ramp step size.</p> <p>0x0: Disables the frequency ramping feature.</p> <p>0x1: Ramp step size range is 2–40 Fint cycles.</p> <p>0x2: Ramp step size range is 4–80 Fint cycles.</p> <p>0x3: Ramp step size range is 12–240 Fint cycles.</p>	RW	0x0
23:20	PERIPH_DPLL_FREQSEL	<p>This bit field allows selecting the proper range of the DPLL4 internal frequency depending on the DPLL reference clock and the N divider.</p> <p>0x3: 0.75 MHz—1.0 MHz</p> <p>0x4: 1.0 MHz—1.25 MHz</p> <p>0x5: 1.25 MHz—1.5 MHz</p> <p>0x6: 1.5 MHz—1.75 MHz</p> <p>0x7: 1.75 MHz—2.1 MHz</p> <p>0xB: 7.5 MHz—10 MHz</p> <p>0xC: 10 MHz—12.5 MHz</p> <p>0xD: 12.5 MHz—15 MHz</p> <p>0xE: 15 MHz—17.5 MHz</p> <p>0xF: 17.5 MHz—21 MHz</p>	RW	0x1
19	EN_PERIPH_DPLL_DRIFTGUARD	<p>This bit allows to enable or disable the automatic recalibration feature of the DPLL4. The DPLL4 will automatically start a recalibration process upon assertion of the recal flag if this bit is set.</p> <p>0x0: Disables the DPLL4 automatic recalibration mode</p> <p>0x1: Enables the DPLL4 automatic recalibration mode</p>	RW	0x0
18:16	EN_PERIPH_DPLL	<p>DPLL4 control; Other enums: Reserved</p> <p>0x1: Put the DPLL4 in low power stop mode</p> <p>0x7: Enables the DPLL4 in lock mode</p>	RW	0x1
15:13	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
12	PWRDN_EMU_CORE	<p>This bit allows to power-down or not the DPLL3_M3X2 HSDIVIDER path.</p> <p>0x0: Power-up the DPLL3_M3X2 HSDIVIDER path.</p> <p>0x1: Power-down the DPLL3_M3X2 HSDIVIDER path. Writing this bit to 1 will take effect immediately.</p>	RW	0x0
11	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
10	EN_CORE_DPLL_LP_MODE	<p>This bit allows to enable or disable the LP mode of the DPLL3. Writing this bit to switch the mode between LP or normal mode will take effect only when the DPLL will have transition into the bypass or stop state, followed by a lock or re-lock of the DPLL.</p> <p>0x0: Disables the DPLL LP mode to re-enter the normal mode at the following lock or re-lock sequence.</p> <p>0x1: Enables the DPLL LP mode to enter the LP mode at the following lock or re-lock sequence.</p>	RW	0x0
9:8	CORE_DPLL_RAMPTIME	<p>The DPLL provides an output clock frequency ramping feature when switching from bypass clock to normal clock during lock and relock. The frequency ramping occurs in a maximum of four steps in frequency before the DPLL frequency lock indicator is asserted. The ramp step size is specified in the number of DPLL internal reference clock cycles. The internal DPLL reference clock cycle is given by: <math>F_{int} = \text{DPLL input reference clock frequency} / (N + 1)</math>, where N is the value in the CM_CLKSEL1_PLL[14:8] CORE_DPLL_DIV bit field. This register is used to enable and disable the DPLL ramping feature. If enabled, it is also used to select a range of ramp step sizes. The step size used per range depends on the DPLL internal reference clock frequency: the lower the frequency, the smaller the ramp step size.</p> <p>0x0: Disables the frequency ramping feature.</p> <p>0x1: Ramp step size range is 2–40 Fint cycles.</p> <p>0x2: Ramp step size range is 4–80 Fint cycles.</p> <p>0x3: Ramp step size range is 12–240 Fint cycles.</p>	RW	0x0
7:4	CORE_DPLL_FREQSEL	<p>This bit field allows selecting the proper range of the DPLL3 internal frequency depending on the DPLL reference clock and the N divider.</p> <p>0x3: 0.75 MHz—1.0 MHz</p> <p>0x4: 1.0 MHz—1.25 MHz</p> <p>0x5: 1.25 MHz—1.5 MHz</p> <p>0x6: 1.5 MHz—1.75 MHz</p> <p>0x7: 1.75 MHz—2.1 MHz</p> <p>0xB: 7.5 MHz—10 MHz</p> <p>0xC: 10 MHz—12.5 MHz</p> <p>0xD: 12.5 MHz—15 MHz</p> <p>0xE: 15 MHz—17.5 MHz</p> <p>0xF: 17.5 MHz—21 MHz</p>	RW	0x1
3	EN_CORE_DPLL_DRIFTGUARD	<p>This bit allows to enable or disable the automatic recalibration feature of the DPLL3. The DPLL3 will automatically start a recalibration process upon assertion of the recal flag if this bit is set.</p> <p>0x0: Disables the DPLL3 automatic recalibration mode</p> <p>0x1: Enables the DPLL3 automatic recalibration mode</p>	RW	0x0
2:0	EN_CORE_DPLL	<p>DPLL3 control; Other enums: Reserved</p> <p>0x5: Put the DPLL3 in low power bypass</p> <p>0x6: Put the DPLL3 in fast relock bypass</p> <p>0x7: Enables the DPLL3 in lock mode</p>	RW	0x5

7	CLKOUT2_EN	This bit controls the external output clock activity 0x0: sys_clkout2 is disabled 0x1: sys_clkout2 is enabled	RW	0x0
6	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
5:3	CLKOUT2_DIV	This field controls the external output clock division; Other enums: Reserved 0x0: sys_clkout2 / 1 0x1: sys_clkout2 / 2 0x2: sys_clkout2 / 4 0x3: sys_clkout2 / 8 0x4: sys_clkout2 / 16	RW	0x0
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1:0	CLKOUT2SOURCE	This field selects the external output clock source 0x0: source is CORE_CLK 0x1: source is CM_SYS_CLK 0x2: source is CM_96M_FCLK 0x3: source is 54 MHz clock	RW	0x3

### 4.14.1.9 DSS\_CM Register Descriptions

#### 4.14.1.9.1 CM\_FCLKEN\_DSS

**Table 4-165. CM\_FCLKEN\_DSS**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	DSS_CM
<b>Physical Address</b>	0x4800 4E00		
<b>Description</b>	Controls the modules functional clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																											EN_TV	EN_DSS2	EN_DSS1		

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
2	EN_TV	DSS_TV_FCLK functional clock control 0x0: DSS_TV_FCLK is disabled 0x1: DSS_TV_FCLK is enabled	RW	0x0
1	EN_DSS2	Display Sub-System functional clock 2 control 0x0: DSS2_ALWON_FCLK is disabled 0x1: DSS2_ALWON_FCLK is enabled	RW	0x0
0	EN_DSS1	Display Sub-System functional clock 1 control 0x0: DSS1_ALWON_FCLK is disabled 0x1: DSS1_ALWON_FCLK is enabled	RW	0x0

#### 4.14.1.9.2 CM\_ICLKEN\_DSS

**Table 4-166. CM\_ICLKEN\_DSS**

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	DSS_CM
<b>Physical Address</b>	0x4800 4E10		
<b>Description</b>	Controls the modules interface clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																											EN_DSS				

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	EN_DSS	Display sub-system interface clock control 0x0: DSS_L3_ICLK and DSS_L4_ICLK are disabled 0x1: DSS_L3_ICLK and DSS_L4_ICLK are enabled	RW	0x0

#### 4.14.1.9.3 CM\_IDLEST\_DSS

**Table 4-167. CM\_IDLEST\_DSS**

<b>Address Offset</b>	0x0000 0020		
<b>Physical Address</b>	0x4800 4E20	<b>Instance</b>	DSS_CM
<b>Description</b>	Modules access availability monitoring. This register is read only and automatically updated.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ST_DSS_IDLE		ST_DSS_STDBY													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Read returns 0.	R	0x00000000
1	ST_DSS_IDLE	Display Sub-System idle status. 0x0: Display Sub-System is active. 0x1: Display Sub-System is in idle mode and cannot be accessed.	R	0x1
0	ST_DSS_STDBY	Display Sub-System standby status. 0x0: Display Sub-System is active. 0x1: Display Sub-System is in standby mode.	R	0x1

#### 4.14.1.9.4 CM\_AUTOIDLE\_DSS

**Table 4-168. CM\_AUTOIDLE\_DSS**

<b>Address Offset</b>	0x0000 0030		
<b>Physical Address</b>	0x4800 4E30	<b>Instance</b>	DSS_CM
<b>Description</b>	This register controls the automatic control of the modules interface clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																AUTO_DSS															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	AUTO_DSS	Display Sub-System auto clock control. 0x0: Display Sub-System interface clock is unrelated to the domain state transition. 0x1: Display Sub-System interface clock is automatically enabled or disabled along with the domain state transition.	RW	0x0

**4.14.1.9.5 CM\_CLKSEL\_DSS**
**Table 4-169. CM\_CLKSEL\_DSS**

<b>Address Offset</b>	0x0000 0040	<b>Instance</b>	DSS_CM
<b>Physical Address</b>	0x4800 4E40		
<b>Description</b>	Modules clock selection.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKSEL_TV				RESERVED		CLKSEL_DSS1									

Bits	Field Name	Description	Type	Reset
31:13	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000
12:8	CLKSEL_TV	TV functional clock divider factor DPLL4 M3 (1 up to 16); Other enums: Reserved  0x1: TV functional clock is DPLL4 clock divided by 1 0x2: TV functional clock is DPLL4 clock divided by 2 0x3: TV functional clock is DPLL4 clock divided by 3 0x4: TV functional clock is DPLL4 clock divided by 4 0x5: TV functional clock is DPLL4 clock divided by 5 0x6: TV functional clock is DPLL4 clock divided by 6 0x7: TV functional clock is DPLL4 clock divided by 7 0x8: TV functional clock is DPLL4 clock divided by 8 0x9: TV functional clock is DPLL4 clock divided by 9 0xA: TV functional clock is DPLL4 clock divided by 10 0xB: TV functional clock is DPLL4 clock divided by 11 0xC: TV functional clock is DPLL4 clock divided by 12 0xD: TV functional clock is DPLL4 clock divided by 13 0xE: TV functional clock is DPLL4 clock divided by 14 0xF: TV functional clock is DPLL4 clock divided by 15 0x10: TV functional clock is DPLL4 clock divided by 16	RW	0x10
7:5	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
4:0	CLKSEL_DSS1	DPLL4 M4 divide factor for DSS1_ALWON_FCLK (1 up to 16); Other enums: Reserved 0x1: DSS1_ALWON_FCLK is DPLL4 clock divided by 1 0x2: DSS1_ALWON_FCLK is DPLL4 clock divided by 2 0x3: DSS1_ALWON_FCLK is DPLL4 clock divided by 3 0x4: DSS1_ALWON_FCLK is DPLL4 clock divided by 4 0x5: DSS1_ALWON_FCLK is DPLL4 clock divided by 5 0x6: DSS1_ALWON_FCLK is DPLL4 clock divided by 6 0x7: DSS1_ALWON_FCLK is DPLL4 clock divided by 7 0x8: DSS1_ALWON_FCLK is DPLL4 clock divided by 8 0x9: DSS1_ALWON_FCLK is DPLL4 clock divided by 9 0xA: DSS1_ALWON_FCLK is DPLL4 clock divided by 10 0xB: DSS1_ALWON_FCLK is DPLL4 clock divided by 11 0xC: DSS1_ALWON_FCLK is DPLL4 clock divided by 12 0xD: DSS1_ALWON_FCLK is DPLL4 clock divided by 13 0xE: DSS1_ALWON_FCLK is DPLL4 clock divided by 14 0xF: DSS1_ALWON_FCLK is DPLL4 clock divided by 15 0x10: DSS1_ALWON_FCLK is DPLL4 clock divided by 16	RW	0x10

**4.14.1.9.7 CM\_CLKSTCTRL\_DSS**
**Table 4-171. CM\_CLKSTCTRL\_DSS**

<b>Address Offset</b>	0x0000 0048		
<b>Physical Address</b>	0x4800 4E48	<b>Instance</b>	DSS_CM
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ACTIVE and INACTIVE states.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												CLKTRCTRL_DSS			

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	CLKTRCTRL_DSS	Controls the clock state transition of the DSS clock domain. 0x0: Automatic transition is disabled 0x1: Start a software supervised sleep transition on the domain 0x2: Start a software supervised wake-up transition on the domain 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x0

**4.14.1.9.8 CM\_CLKSTST\_DSS**
**Table 4-172. CM\_CLKSTST\_DSS**

<b>Address Offset</b>	0x0000 004C		
<b>Physical Address</b>	0x4800 4E4C	<b>Instance</b>	DSS_CM
<b>Description</b>	This register provides a status on the OCP interface clock activity in the domain.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31:29	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
28:24	DIV_DPLL4	DPLL4 M6 clock divider factor (1 up to 16); Other enums: Reserved 0x1: EMU_PER_ALWON_CLK is DPLL4 clock divided by 1 0x2: EMU_PER_ALWON_CLK is DPLL4 clock divided by 2 0x3: EMU_PER_ALWON_CLK is DPLL4 clock divided by 3 0x4: EMU_PER_ALWON_CLK is DPLL4 clock divided by 4 0x5: EMU_PER_ALWON_CLK is DPLL4 clock divided by 5 0x6: EMU_PER_ALWON_CLK is DPLL4 clock divided by 6 0x7: EMU_PER_ALWON_CLK is DPLL4 clock divided by 7 0x8: EMU_PER_ALWON_CLK is DPLL4 clock divided by 8 0x9: EMU_PER_ALWON_CLK is DPLL4 clock divided by 9 0xA: EMU_PER_ALWON_CLK is DPLL4 clock divided by 10 0xB: EMU_PER_ALWON_CLK is DPLL4 clock divided by 11 0xC: EMU_PER_ALWON_CLK is DPLL4 clock divided by 12 0xD: EMU_PER_ALWON_CLK is DPLL4 clock divided by 13 0xE: EMU_PER_ALWON_CLK is DPLL4 clock divided by 14 0xF: EMU_PER_ALWON_CLK is DPLL4 clock divided by 15 0x10: EMU_PER_ALWON_CLK is DPLL4 clock divided by 16	RW	0x10
23:21	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
20:16	DIV_DPLL3	DPLL3_M3X2 clock divider factor (1 up to 16); Other enums: Reserved 0x1: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 1 0x2: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 2 0x3: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 3 0x4: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 4 0x5: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 5 0x6: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 6 0x7: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 7 0x8: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 8 0x9: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 9 0xA: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 10 0xB: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 11 0xC: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 12 0xD: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 13 0xE: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 14 0xF: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 15 0x10: EMU_CORE_ALWON_CLK is DPLL3 clock divided by 16	RW	0x10
15:14	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
13:11	CLKSEL_TRACECLK	Selects the TRACE clock; Other enums: Reserved 0x1: TRACECLK.FCLK is the selected TRACE source clock divided by 1 0x2: TRACECLK.FCLK is the selected TRACE source clock divided by 2 0x4: TRACECLK.FCLK is the selected TRACE source clock divided by 4	RW	0x1
10:8	CLKSEL_PCLK	Selects the PCLK clock; Other enums: Reserved 0x2: PCLK.FCLK is the selected PCLK source clock divided by 2 0x3: PCLK.FCLK is the selected PCLK source clock divided by 3 0x4: PCLK.FCLK is the selected PCLK source clock divided by 4 0x6: PCLK.FCLK is the selected PCLK source clock divided by 6	RW	0x2
7:6	CLKSEL_PCLKX2	Selects the PCLKx2 clock; Other enums: Reserved 0x1: PCLKx2.FCLK is the selected PCLK source clock divided by 1 0x2: PCLKx2.FCLK is the selected PCLK source clock divided by 2 0x3: PCLKx2.FCLK is the selected PCLK source clock divided by 3	RW	0x1
5:4	CLKSEL_ATCLK	Selects the ATCLK clock; Other enums: Reserved 0x1: ATCLK.FCLK is the selected ATCLK source clock divided by 1 0x2: ATCLK.FCLK is the selected ATCLK source clock divided by 2	RW	0x1
3:2	TRACE_MUX_CTRL	Selection of TRACECLK.FCLK source clock 0x0: TRACE source clock is SYS_CLK 0x1: TRACE source clock is EMU_CORE_ALWON_CLK 0x2: TRACE source clock is EMU_PER_ALWON clock 0x3: TRACE source clock is EMU_MPU_ALWON clock	RW	0x0
1:0	MUX_CTRL	Selection of ATCLK.FCLK, PCLK.FCLK and PCLKx2.FCLK source clock 0x0: ATCLK, PCLK and PCLKx2 source clock is SYS_CLK 0x1: ATCLK, PCLK and PCLKx2 source clock is EMU_CORE_ALWON_CLK 0x2: ATCLK, PCLK and PCLKx2 source clock is EMU_PER_ALWON clock 0x3: ATCLK, PCLK and PCLKx2 source clock is EMU_MPU_ALWON_CLK	RW	0x0

4.14.1.12.2 CM\_CLKSTCTRL\_EMU

Table 4-190. CM\_CLKSTCTRL\_EMU

<b>Address Offset</b>	0x0000 0048	<b>Instance</b>	EMU_CM
<b>Physical Address</b>	0x4800 5148		
<b>Description</b>	This register allows to enable or disable software and hardware supervised transition between ACTIVE and INACTIVE states.		
<b>Type</b>	RW		

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	CLKTRCTRL_EMU	Controls the clock state transition of the EMULATION clock domain. 0x0: Reserved 0x1: Start a software supervised sleep transition on the domain 0x2: Start a software supervised wake-up transition on the domain or maintain emulation domain active. (force wakeup has to be kept asserted to keep Emulation domain ON) 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x2

4.14.1.12.3 CM\_CLKSTST\_EMU

Table 4-191. CM\_CLKSTST\_EMU

<b>Address Offset</b>	0x0000 004C	<b>Instance</b>	EMU_CM
<b>Physical Address</b>	0x4800 514C		
<b>Description</b>	This register provides a status on the clock activity in the domain (depends on the selected source clock).		
<b>Type</b>	R		

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	CLKACTIVITY_EMU	Clock activity status (depends on the selected source clock) 0x0: No domain clock activity 0x1: Domain clock is active	R	0x0

#### 4.14.1.12.4 CM\_CLKSEL2\_EMU

**Table 4-192. CM\_CLKSEL2\_EMU**

<b>Address Offset</b>	0x0000 0050	<b>Instance</b>	EMU_CM
<b>Physical Address</b>	0x4800 5150		
<b>Description</b>	This register provides override controls over the DPLL3.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												OVERWRITE_ENABLE	CORE_DPLL_EMU_MULT							RESERVED	CORE_DPLL_EMU_DIV										

Bits	Field Name	Description	Type	Reset
31:20	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000
19	OVERWRITE_ENABLE	This bit allows to enable or disable the emulation override controls 0x0: The emulation override controls are disabled 0x1: The emulation override controls are enabled	RW	0x0
18:8	CORE_DPLL_EMU_MULT	DPLL3 override multiplier factor (0 to 2047)	RW	0x000
7	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
6:0	CORE_DPLL_EMU_DIV	DPLL3 override divider factor (0 to 127)	RW	0x00

**4.14.1.12.5 CM\_CLKSEL3\_EMU**
**Table 4-193. CM\_CLKSEL3\_EMU**

<b>Address Offset</b>	0x0000 0054		
<b>Physical Address</b>	0x4800 5154	<b>Instance</b>	EMU_CM
<b>Description</b>	This register provides override controls over the PERIPHERAL DPLL.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED												OVERWRITE_ENABLE	PERIPH_DPLL_EMU_MULT										RESERVED	PERIPH_DPLL_EMU_DIV							

Bits	Field Name	Description	Type	Reset
31:20	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000
19	OVERWRITE_ENABLE	This bit allows to enable or disable the emulation override controls  0x0: The emulation override controls are disabled 0x1: The emulation override controls are enabled	RW	0x0
18:8	PERIPH_DPLL_EMU_MULT	DPLL4 override multiplier factor (0 to 2047)	RW	0x000
7	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
6:0	PERIPH_DPLL_EMU_DIV	DPLL4 override divider factor (0 to 127)	RW	0x00

### 4.14.1.13 Global\_Reg\_CM Register Descriptions

#### 4.14.1.13.1 CM\_POLCTRL

**Table 4-194. CM\_POLCTRL**

<b>Address Offset</b>	0x0000 009C	<b>Instance</b>	Global_Reg_CM
<b>Physical Address</b>	0x4800 529C		
<b>Description</b>	This register allows setting the polarity of device outputs control signals.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																	CLKOUT2_POL														

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	CLKOUT2_POL	Controls the external output clock 2 polarity when disabled 0x0: sys_clkout2 is gated low when inactive 0x1: sys_clkout2 is gated high when inactive	RW	0x0

#### 4.14.1.14 NEON\_CM Register Descriptions

##### 4.14.1.14.1 CM\_IDLEST\_NEON

**Table 4-195. CM\_IDLEST\_NEON**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	NEON_CM
<b>Physical Address</b>	0x4800 5320		
<b>Description</b>	Modules access availability monitoring. This register is read only and automatically updated.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															ST_NEON

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Read returns 0.	R	0x00000000
0	ST_NEON	NEON standby status. 0x0: NEON is active 0x1: NEON is in standby mode	R	0x1

**4.14.1.14.2 CM\_CLKSTCTRL\_NEON**
**Table 4-196. CM\_CLKSTCTRL\_NEON**

<b>Address Offset</b>	0x0000 0048		
<b>Physical Address</b>	0x4800 5348	<b>Instance</b>	NEON_CM
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ACTIVE and INACTIVE states.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKTRCTRL_NEON															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	CLKTRCTRL_NEON	Controls the clock state transition of the NEON clock domain. 0x0: Automatic transition is disabled 0x1: Start a software supervised sleep transition on the domain 0x2: Start a software supervised wake-up transition on the domain 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x0

#### 4.14.1.15 USBHOST\_CM Register Descriptions

##### 4.14.1.15.1 CM\_FCLKEN\_USBHOST

**Table 4-197. CM\_FCLKEN\_USBHOST**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	USBHOST_CM
<b>Physical Address</b>	0x4800 5400		
<b>Description</b>	Controls the modules functional clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_USBHOST2		EN_USBHOST1													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1	EN_USBHOST2	USB HOST 120-MHz functional clock control 0x0: USBHOST_120M_FCLK is disabled 0x1: USBHOST_120M_FCLK is enabled	RW	0x0
0	EN_USBHOST1	USB HOST 48-MHz functional clock control 0x0: USBHOST_48M_FCLK is disabled 0x1: USBHOST_48M_FCLK is enabled	RW	0x0

##### 4.14.1.15.2 CM\_ICLKEN\_USBHOST

**Table 4-198. CM\_ICLKEN\_USBHOST**

<b>Address Offset</b>	0x0000 0010	<b>Instance</b>	USBHOST_CM
<b>Physical Address</b>	0x4800 5410		
<b>Description</b>	Controls the modules interface clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_USBHOST															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	EN_USBHOST	USB HOST interface clock control 0x0: USB HOST interface clock is disabled 0x1: USB HOST interface clock is enabled	RW	0x0

**4.14.1.15.3 CM\_IDLEST\_USBHOST**
**Table 4-199. CM\_IDLEST\_USBHOST**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	USBHOST_CM
<b>Physical Address</b>	0x4800 5420		
<b>Description</b>	Modules access availability monitoring. This register is read only and automatically updated.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ST_USBHOST_IDLE		ST_USBHOST_STDBY													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Read returns 0.	R	0x00000000
1	ST_USBHOST_IDLE	USB HOST idle status. 0x0: USB HOST is active. 0x1: USB HOST is in idle mode and cannot be accessed.	R	0x1
0	ST_USBHOST_STDBY	USB HOST standby status. 0x0: USB HOST is active. 0x1: USB HOST is in standby mode.	R	0x1

**4.14.1.15.4 CM\_AUTOIDLE\_USBHOST**
**Table 4-200. CM\_AUTOIDLE\_USBHOST**

<b>Address Offset</b>	0x0000 0030	<b>Instance</b>	USBHOST_CM
<b>Physical Address</b>	0x4800 5430		
<b>Description</b>	This register controls the automatic control of the modules interface clock activity.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																AUTO_USBHOST															

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	AUTO_USBHOST	USB HOST auto clock control. 0x0: USB HOST interface clock is unrelated to the domain state transition. 0x1: USB HOST interface clock is automatically enabled or disabled along with the domain state transition.	RW	0x0

**4.14.1.15.6 CM\_CLKSTCTRL\_USBHOST**
**Table 4-202. CM\_CLKSTCTRL\_USBHOST**

<b>Address Offset</b>	0x0000 0048	<b>Instance</b>	USBHOST_CM
<b>Physical Address</b>	0x4800 5448		
<b>Description</b>	This register enables the domain power state transition. It controls the hardware supervised domain power state transition between ACTIVE and INACTIVE states.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CLKTRCTRL_USBHOST															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	CLKTRCTRL_USBHOST	Controls the clock state transition of the USB HOST clock domain. 0x0: Automatic transition is disabled 0x1: Start a software supervised sleep transition on the domain 0x2: Start a software supervised wake-up transition on the domain 0x3: Automatic transition is enabled. Transition is supervised by the hardware.	RW	0x0

**4.14.1.15.7 CM\_CLKSTST\_USBHOST**
**Table 4-203. CM\_CLKSTST\_USBHOST**

<b>Address Offset</b>	0x0000 004C		
<b>Physical Address</b>	0x4800 544C	<b>Instance</b>	USBHOST_CM
<b>Description</b>	This register provides a status on the interface clock activity in the domain.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												CLKACTIVITY_USBHOST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	CLKACTIVITY_USBHOST	Interface clock activity status 0x0: No domain interface clock activity 0x1: Domain interface clock is active	R	0x0

### 4.14.2 PRM Module Registers

This section describes the PRM module registers. [Table 4-204](#) lists the physical address of the PRM modules. [Table 4-205](#) through [Table 4-210](#) provide register mapping summaries and describe the bits in the individual registers.

**Table 4-204. PRM Instance Summary**

Module Name	Base address (hex)	Size	Section
IVA2_PRM	0x4830 6000	8192 bytes	<a href="#">Section 4.14.2.2</a>
OCP_System_Reg_PRM	0x4830 6800	8192 bytes	<a href="#">Section 4.14.2.3</a>

### 4.14.2.4 MPU\_PRM Register Descriptions

#### 4.14.2.4.1 RM\_RSTST\_MPU

**Table 4-231. RM\_RSTST\_MPU**

<b>Address Offset</b>	0x0000 0058	<b>Instance</b>	MPU_PRM
<b>Physical Address</b>	0x4830 6958		
<b>Description</b>	This register logs the different reset sources of the MPU domain. Each bit is set upon release of the domain reset signal. Must be cleared by software.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EMULATION_MPU_RST	RESERVED								COREDOMAINWKUP_RST	DOMAINWKUP_RST	GLOBALWARM_RST	GLOBALCOLD_RST			

Bits	Field Name	Description	Type	Reset
31:12	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000
11	EMULATION_MPU_RST	Emulation reset 0x0: Status bit unchanged 0x0: No emulation reset. 0x1: Status bit is cleared to 0 0x1: MPU domain has been reset upon an emulation reset	RW	0x0
10:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00
3	COREDOMAINWKUP_RST	CORE domain wake-up reset 0x0: No power domain wake-up reset. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: MPU domain has been reset following a CORE power domain wake-up from OFF to ON.	RW	0x0
2	DOMAINWKUP_RST	Power domain wake-up reset 0x0: No power domain wake-up reset. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: MPU domain has been reset following a MPU power domain wake-up.	RW	0x0
1	GLOBALWARM_RST	Global warm reset 0x0: Status bit unchanged 0x0: No global warm reset. 0x1: MPU domain has been reset upon a global warm reset 0x1: Status bit is cleared to 0	RW	0x0

Bits	Field Name	Description	Type	Reset
0	GLOBALCOLD_RST	Global cold reset 0x0: Status bit unchanged 0x0: No global cold reset. 0x1: Status bit is cleared to 0 0x1: MPU domain has been reset upon a global cold reset	RW	0x1

#### 4.14.2.4.2 PM\_WKDEP\_MPU

**Table 4-232. PM\_WKDEP\_MPU**

<b>Address Offset</b>	0x0000 00C8	<b>Instance</b>	MPU_PRM
<b>Physical Address</b>	0x4830 69C8		
<b>Description</b>	This register allows enabling or disabling the wake-up of the MPU domain upon another domain wakeup events.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							EN_PER	RESERVED	EN_DSS	RESERVED	EN_IVA2	RESERVED	EN_CORE		

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
7	EN_PER	PER domain dependency 0x0: MPU domain is independent of PER domain wake-up event. 0x1: MPU domain is woken-up upon PER domain wake-up event.	RW	0x1
6	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
5	EN_DSS	DSS domain dependency 0x0: MPU domain is independent of DSS domain wake-up event. 0x1: MPU domain is woken-up upon DSS domain wake-up event.	RW	0x1
4:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
2	EN_IVA2	IVA2 domain dependency 0x0: MPU domain is independent of IVA2 domain wake-up event. 0x1: MPU domain is woken-up upon IVA2 domain wake-up event.	RW	0x1
1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
0	EN_CORE	CORE domain dependency 0x0: MPU domain is independent of CORE domain wake-up event. 0x1: MPU domain is woken-up upon CORE domain wake-up event.	RW	0x1

**4.14.2.4.3 PM\_EVGENCTRL\_MPU**
**Table 4-233. PM\_EVGENCTRL\_MPU**

<b>Address Offset</b>	0x0000 00D4		
<b>Physical Address</b>	0x4830 69D4	<b>Instance</b>	MPU_PRM
<b>Description</b>	This register allows controlling the feature of the event generator.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												OFFLOADMODE	ONLOADMODE	ENABLE	

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0's for future compatibility . Read returns 0	R	0x00000000
4:3	OFFLOADMODE	OFF load mode setting 0x0: Load on update of PM_EVGENOFFTIM_MPU 0x1: Reserved 0x2: Load on MPU standby signal assertion 0x3: Auto load	RW	0x2
2:1	ONLOADMODE	ON load mode setting 0x0: Load on update of PM_EVGENONTIM_MPU 0x1: Load on MPU standby signal de-assertion 0x2: Reserved 0x3: Auto load	RW	0x1
0	ENABLE	Event generator control 0x0: Disable event generator 0x1: Enable event generator	RW	0x0

#### 4.14.2.4.4 PM\_EVGENONTIM\_MPU

**Table 4-234. PM\_EVGENONTIM\_MPU**

<b>Address Offset</b>	0x0000 00D8		
<b>Physical Address</b>	0x4830 69D8	<b>Instance</b>	MPU_PRM
<b>Description</b>	This register sets the ON count duration of the event generator (number of system clock cycles).		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ONTIMEVAL																															

Bits	Field Name	Description	Type	Reset
31:0	ONTIMEVAL	Number of system clock cycles for the ON period.	RW	0x00000000

#### 4.14.2.4.5 PM\_EVGENOFFTIM\_MPU

**Table 4-235. PM\_EVGENOFFTIM\_MPU**

<b>Address Offset</b>	0x0000 00DC		
<b>Physical Address</b>	0x4830 69DC	<b>Instance</b>	MPU_PRM
<b>Description</b>	This register sets the OFF count duration of the event generator (number of system clock cycles).		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFFTIMEVAL																															

Bits	Field Name	Description	Type	Reset
31:0	OFFTIMEVAL	Number of system clock cycles for the OFF period.	RW	0x00000000

#### 4.14.2.4.6 PM\_PWSTCTRL\_MPU

**Table 4-236. PM\_PWSTCTRL\_MPU**

<b>Address Offset</b>	0x0000 00E0	<b>Instance</b>	MPU_PRM
<b>Physical Address</b>	0x4830 69E0		
<b>Description</b>	This register controls the MPU domain power state transition.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																L2CACHEONSTATE		RESERVED						L2CACHERETSTATE		RESERVED				MEMORYCHANGE	LOGICL1CACHERETSTATE	POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:18	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000
17:16	L2CACHEONSTATE	L2 Cache memory state when domain is ON; Other enums: Reserved 0x0: L2 Cache memory is OFF when domain is ON. 0x1: reserved 0x2: reserved 0x3: L2 Cache memory is ON when domain is ON.	RW	0x3
15:9	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00
8	L2CACHERETSTATE	L2 Cache memory state when domain is RETENTION 0x0: L2 Cache memory is OFF when domain is in RETENTION state. 0x1: L2 Cache memory is retained when domain is in RETENTION state.	RW	0x1
7:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
3	MEMORYCHANGE	Memory change control in ON state 0x0: Disable memory change 0x1: Enable memory change state in ON state. This bit is automatically cleared when memory state is effectively changed.	RW	0x0
2	LOGICL1CACHERETSTATE	Logic and L1 Cache state when domain is RETENTION 0x0: Logic and L1 Cache are OFF when domain is in RETENTION state. 0x1: Logic and L1 Cache are retained when domain is in RETENTION state.	RW	0x1
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: reserved 0x3: ON State	RW	0x3

**4.14.2.4.7 PM\_PWSTST\_MPU**
**Table 4-237. PM\_PWSTST\_MPU**

<b>Address Offset</b>	0x0000 00E4	<b>Instance</b>	MPU_PRM
<b>Physical Address</b>	0x4830 69E4		
<b>Description</b>	This register provides a status on the MPU domain power state.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31	RESERVED	Write 1's for future compatibility. Read returns 1.	RW	0x1
30	GRPSEL_MMC3	Select the MMC 3 in the IVA2 wake-up events group 0x0: MMC 3 is not attached to the IVA2 wake-up events group. 0x1: MMC 3 is attached to the IVA2 wake-up events group.	RW	0x1
29:26	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
25	GRPSEL_MMC2	Select the MMC 2 in the IVA2 wake-up events group 0x0: MMC 2 is not attached to the IVA2 wake-up events group. 0x1: MMC 2 is attached to the IVA2 wake-up events group.	RW	0x1
24	GRPSEL_MMC1	Select the MMC 1 in the IVA2 wake-up events group 0x0: MMC 1 is not attached to the IVA2 wake-up events group. 0x1: MMC 1 is attached to the IVA2 wake-up events group.	RW	0x1
23:22	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
21	GRPSEL_MCSPI4	Select the McSPI 4 in the IVA2 wake-up events group 0x0: McSPI 4 is not attached to the IVA2 wake-up events group. 0x1: McSPI 4 is attached to the IVA2 wake-up events group.	RW	0x1
20	GRPSEL_MCSPI3	Select the McSPI 3 in the IVA2 wake-up events group 0x0: McSPI 3 is not attached to the IVA2 wake-up events group. 0x1: McSPI 3 is attached to the IVA2 wake-up events group.	RW	0x1
19	GRPSEL_MCSPI2	Select the McSPI 2 in the IVA2 wake-up events group 0x0: McSPI 2 is not attached to the IVA2 wake-up events group. 0x1: McSPI 2 is attached to the IVA2 wake-up events group.	RW	0x1
18	GRPSEL_MCSPI1	Select the McSPI 1 in the IVA2 wake-up events group 0x0: McSPI 1 is not attached to the IVA2 wake-up events group. 0x1: McSPI 1 is attached to the IVA2 wake-up events group.	RW	0x1
17	GRPSEL_I2C3	Select the I2C 3 in the IVA2 wake-up events group 0x0: I2C 3 is not attached to the IVA2 wake-up events group. 0x1: I2C 3 is attached to the IVA2 wake-up events group.	RW	0x1
16	GRPSEL_I2C2	Select the I2C 2 in the IVA2 wake-up events group 0x0: I2C 2 is not attached to the IVA2 wake-up events group. 0x1: I2C 2 is attached to the IVA2 wake-up events group.	RW	0x1

Bits	Field Name	Description	Type	Reset
15	GRPSEL_I2C1	Select the I2C 1 in the IVA2 wake-up events group 0x0: I2C 1 is not attached to the IVA2 wake-up events group. 0x1: I2C 1 is attached to the IVA2 wake-up events group.	RW	0x1
14	GRPSEL_UART2	Select the UART 2 in the IVA2 wake-up events group 0x0: UART 2 is not attached to the IVA2 wake-up events group. 0x1: UART 2 is attached to the IVA2 wake-up events group.	RW	0x1
13	GRPSEL_UART1	Select the UART 1 in the IVA2 wake-up events group 0x0: UART 1 is not attached to the IVA2 wake-up events group. 0x1: UART 1 is attached to the IVA2 wake-up events group.	RW	0x1
12	GRPSEL_GPT11	Select the GPTIMER 11 in the IVA2 wake-up events group 0x0: GPTIMER 11 is not attached to the IVA2 wake-up events group. 0x1: GPTIMER 11 is attached to the IVA2 wake-up events group.	RW	0x1
11	GRPSEL_GPT10	Select the GPTIMER 10 in the IVA2 wake-up events group 0x0: GPTIMER 10 is not attached to the IVA2 wake-up events group. 0x1: GPTIMER 10 is attached to the IVA2 wake-up events group.	RW	0x1
10	GRPSEL_MCBSP5	Select the McBSP 5 in the IVA2 wake-up events group 0x0: McBSP 5 is not attached to the IVA2 wake-up events group. 0x1: McBSP 5 is attached to the IVA2 wake-up events group.	RW	0x1
9	GRPSEL_MCBSP1	Select the McBSP 1 in the IVA2 wake-up events group 0x0: McBSP 1 is not attached to the IVA2 wake-up events group. 0x1: McBSP 1 is attached to the IVA2 wake-up events group.	RW	0x1
8:5	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
4	GRPSEL_HSOTGUSB	Select the HS OTG USB in the IVA2 wake-up events group 0x0: HS OTG USB is not attached to the IVA2 wake-up events group. 0x1: HS OTG USB is attached to the IVA2 wake-up events group.	RW	0x1
3:0	RESERVED	Write 0x8 for future compatibility. Read returns 0x8.	R	0x8

1:0	LASTPOWERSTATEENTERED	Last power state entered 0x0: SGX domain was previously OFF 0x1: SGX domain was previously in RETENTION 0x2: SGX domain was previously INACTIVE 0x3: SGX domain was previously ON	RW	0x0

## 4.14.2.7 WKUP\_PRM Register Descriptions

### 4.14.2.7.1 PM\_WKEN\_WKUP

**Table 4-256. PM\_WKEN\_WKUP**

<b>Address Offset</b>	0x0000 00A0	<b>Instance</b>	WKUP_PRM
<b>Physical Address</b>	0x4830 6CA0		
<b>Description</b>	This register allows enabling/disabling modules wake-up events.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_USIMOCP	EN_IO	EN_SR2	EN_SR1	RESERVED	EN_GPIO1	RESERVED	EN_GPT12	EN_GPT1							

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
9	EN_USIMOCP	USIMOCP wake-up control 0x0: USIMOCP wake-up is disabled 0x1: USIMOCP wake-up event is enabled	RW	0x1
8	EN_IO	IO pad wake-up control 0x0: IO pad wake-up is disabled 0x1: IO pad wake-up event is enabled	RW	0x1
7	EN_SR2	Smart Reflex 2 wake-up control 0x0: Smart Reflex 2 wake-up is disabled 0x1: Smart Reflex 2 wake-up event is enabled	RW	0x1
6	EN_SR1	Smart Reflex 1 wake-up control 0x0: Smart Reflex 1 wake-up is disabled 0x1: Smart Reflex 1 wake-up event is enabled	RW	0x1
5:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
3	EN_GPIO1	GPIO 1 wake-up control 0x0: GPIO 1 wake-up is disabled 0x1: GPIO 1 wake-up event is enabled	RW	0x1
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1	EN_GPT12	GPTIMER 12 wake-up is always enabled	R	0x1
0	EN_GPT1	GPTIMER 1 wake-up control 0x0: GPTIMER 1 wake-up is disabled 0x1: GPTIMER 1 wake-up event is enabled	RW	0x1

#### 4.14.2.7.2 PM\_MPUGRPSEL\_WKUP

**Table 4-257. PM\_MPUGRPSEL\_WKUP**

<b>Address Offset</b>	0x0000 00A4		
<b>Physical Address</b>	0x4830 6CA4	<b>Instance</b>	WKUP_PRM
<b>Description</b>	IO pad is always selected in the MPU wake-up events group		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																GRPSEL_USIMOC	GRPSEL_IO	GRPSEL_SR2	GRPSEL_SR1	RESERVED	GRPSEL_GPIO1	RESERVED	GRPSEL_GPT12	GRPSEL_GPT1							

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
9	GRPSEL_USIMOC	Select the USIMOC in the MPU wake-up events group 0x0: USIMOC is not attached to the MPU wake-up events group. 0x1: USIMOC is attached to the MPU wake-up events group.	RW	0x1
8	GRPSEL_IO	IO pad is always selected in the MPU wake-up events group	R	0x1
7	GRPSEL_SR2	Select the Smart Reflex 2 in the MPU wake-up events group 0x0: Smart Reflex 2 is not attached to the MPU wake-up events group. 0x1: Smart Reflex 2 is attached to the MPU wake-up events group.	RW	0x1
6	GRPSEL_SR1	Select the Smart Reflex 1 in the MPU wake-up events group 0x0: Smart Reflex 1 is not attached to the MPU wake-up events group. 0x1: Smart Reflex 1 is attached to the MPU wake-up events group.	RW	0x1
5:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
3	GRPSEL_GPIO1	Select the GPIO 1 in the MPU wake-up events group 0x0: GPIO 1 is not attached to the MPU wake-up events group. 0x1: GPIO 1 is attached to the MPU wake-up events group.	RW	0x1
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1	GRPSEL_GPT12	GPTIMER 12 is always selected in the MPU wake-up events group	R	0x1
0	GRPSEL_GPT1	Select the GPTIMER 1 in the MPU wake-up events group 0x0: GPTIMER 1 is not attached to the MPU wake-up events group. 0x1: GPTIMER 1 is attached to the MPU wake-up events group.	RW	0x1

**4.14.2.7.3 PM\_IVA2GRPSEL\_WKUP**
**Table 4-258. PM\_IVA2GRPSEL\_WKUP**

<b>Address Offset</b>	0x0000 00A8	<b>Instance</b>	WKUP_PRM
<b>Physical Address</b>	0x4830 6CA8		
<b>Description</b>	This register allows selecting the group of modules that wake-up the IVA2.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																GRPSEL_USIMOCP	GRPSEL_IO	GRPSEL_SR2	GRPSEL_SR1	RESERVED	GRPSEL_GPIO1	RESERVED	GRPSEL_GPT12	GRPSEL_GPT1							

Bits	Field Name	Description	Type	Reset
31:10	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
9	GRPSEL_USIMOCP	Select the USIMOCP in the IVA2 wake-up events group 0x0: USIMOCP module is not attached to the IVA2 wake-up events group. 0x1: USIMOCP module is attached to the IVA2 wake-up events group.	RW	0x0
8	GRPSEL_IO	Select the IO pad in the IVA2 wake-up events group 0x0: IO pad module is not attached to the IVA2 wake-up events group. 0x1: IO pad module is attached to the IVA2 wake-up events group.	RW	0x0
7	GRPSEL_SR2	Select the Smart Reflex 2 in the IVA2 wake-up events group 0x0: Smart Reflex 2 is not attached to the IVA2 wake-up events group. 0x1: Smart Reflex 2 is attached to the IVA2 wake-up events group.	RW	0x0
6	GRPSEL_SR1	Select the Smart Reflex 1 in the IVA2 wake-up events group 0x0: Smart Reflex 1 is not attached to the IVA2 wake-up events group. 0x1: Smart Reflex 1 is attached to the IVA2 wake-up events group.	RW	0x0
5:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
3	GRPSEL_GPIO1	Select the GPIO 1 in the IVA2 wake-up events group 0x0: GPIO 1 is not attached to the IVA2 wake-up events group. 0x1: GPIO 1 is attached to the IVA2 wake-up events group.	RW	0x0
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1	GRPSEL_GPT12	Select the GPTIMER 12 in the IVA2 wake-up events group 0x0: GPTIMER 12 is not attached to the IVA2 wake-up events group. 0x1: GPTIMER 12 is attached to the IVA2 wake-up events group.	RW	0x0
0	GRPSEL_GPT1	Select the GPTIMER 1 in the IVA2 wake-up events group 0x0: GPTIMER 1 is not attached to the IVA2 wake-up events group. 0x1: GPTIMER 1 is attached to the IVA2 wake-up events group.	RW	0x0

#### 4.14.2.7.4 PM\_WKST\_WKUP

**Table 4-259. PM\_WKST\_WKUP**

<b>Address Offset</b>	0x0000 00B0	<b>Instance</b>	WKUP_PRM
<b>Physical Address</b>	0x4830 6CB0		
<b>Description</b>	This register logs the modules wake-up events. Must be cleared by software. It prevents further domain transition if it is not cleared.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Address Offset</b>	0x0000 00E4		
<b>Physical Address</b>	0x4830 6FE4	<b>Instance</b>	CAM_PRM
<b>Description</b>	This register provides a status on the power state transition of the CAMERA domain.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								INTRANSITION	RESERVED																POWERSTATEST						

Bits	Field Name	Description	Type	Reset
31:21	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000
20	INTRANSITION	Domain transition status 0x0: No transition 0x1: CAMERA power domain transition is in progress.	R	0x0
19:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000
1:0	POWERSTATEST	Current power state status 0x0: Power domain is OFF 0x1: Power domain is in RETENTION 0x2: Power domain is INACTIVE 0x3: Power domain is ON	R	0x3

**4.14.2.10.5 PM\_PREPWSTST\_CAM**
**Table 4-272. PM\_PREPWSTST\_CAM**

<b>Address Offset</b>	0x0000 00E8		
<b>Physical Address</b>	0x4830 6FE8	<b>Instance</b>	CAM_PRM
<b>Description</b>	This register provides a status on the CAM domain previous power state. It indicates the state entered during the last sleep transition.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																LASTPOWERSTATEENTERED															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	LASTPOWERSTATEENTERED	Last power state entered 0x0: CAM domain was previously OFF 0x1: CAM domain was previously in RETENTION 0x2: CAM domain was previously INACTIVE 0x3: CAM domain was previously ON	RW	0x0

### 4.14.2.11 PER\_PRM Register Descriptions

#### 4.14.2.11.1 RM\_RSTST\_PER

**Table 4-273. RM\_RSTST\_PER**

<b>Address Offset</b>	0x0000 0058	<b>Instance</b>	PER_PRM
<b>Physical Address</b>	0x4830 7058		
<b>Description</b>	This register logs the different reset sources of the PERIPHERAL domain. Each bit is set upon release of the domain reset signal. Must be cleared by software.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																COREDOMAINWKUP_RST	DOMAINWKUP_RST	GLOBALWARM_RST	GLOBALCOLD_RST												

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
3	COREDOMAINWKUP_RST	CORE domain wake-up reset 0x0: No power domain wake-up reset. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: PER domain has been reset following a CORE power domain wake-up from OFF to ON.	RW	0x0
2	DOMAINWKUP_RST	Power domain wake-up reset 0x0: Status bit unchanged 0x0: No power domain wake-up reset. 0x1: Status bit is cleared to 0 0x1: PER domain has been reset following a PERIPHERAL power domain wake-up.	RW	0x0
1	GLOBALWARM_RST	Global warm reset 0x0: No global warm reset. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: PER domain has been reset upon a global warm reset	RW	0x0
0	GLOBALCOLD_RST	Global cold reset 0x0: No global cold reset. 0x0: Status bit unchanged 0x1: PER domain has been reset upon a global cold reset 0x1: Status bit is cleared to 0	RW	0x1

**4.14.2.11.2 PM\_WKEN\_PER**

1	EN_MCBSP3	McBSP3 Wake-up status 0x0: McBSP 3 wake-up has not occurred or was masked. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: McBSP 3 wake-up has occurred.	RW	0x0
0	EN_MCBSP2	McBSP 2 Wake-up status 0x0: Status bit unchanged 0x0: McBSP 2 wake-up has not occurred or was masked. 0x1: McBSP 2 wake-up has occurred. 0x1: Status bit is cleared to 0	RW	0x0

#### 4.14.2.11.6 PM\_WKDEP\_PER

**Table 4-278. PM\_WKDEP\_PER**

<b>Address Offset</b>	0x0000 00C8		
<b>Physical Address</b>	0x4830 70C8	<b>Instance</b>	PER_PRM
<b>Description</b>	This register allows enabling or disabling the wake-up of the PER domain upon another domain wakeup events.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							EN_WKUP	RESERVED	EN_IVA2	EN_MPU	EN_CORE				

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000000
4	EN_WKUP	WAKEUP domain dependency 0x0: PER domain is independent of WKUP domain wake-up event. 0x1: PER domain is woken-up upon WKUP domain wake-up event.	RW	0x1
3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
2	EN_IVA2	IVA2 domain dependency 0x0: PER domain is independent of IVA2 domain wake-up event. 0x1: PER domain is woken-up upon IVA2 domain wake-up event.	RW	0x1
1	EN_MPU	MPU domain dependency 0x0: PER domain is independent of MPU domain wake-up event. 0x1: PER domain is woken-up upon MPU domain wake-up event.	RW	0x1
0	EN_CORE	CORE domain dependency (CORE-L3 clock domain only, not CORE-L4) 0x0: PER domain is independent of CORE domain wake-up event (CORE-L3 clock domain only, not CORE-L4). 0x1: PER domain is not woken-up upon CORE domain wake-up event.	RW	0x1

**4.14.2.11.7 PM\_PWSTCTRL\_PER**
**Table 4-279. PM\_PWSTCTRL\_PER**

<b>Address Offset</b>	0x0000 00E0	<b>Instance</b>	PER_PRM
<b>Physical Address</b>	0x4830 70E0		
<b>Description</b>	This register controls the PER domain power state transition.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED																MEMONSTATE		RESERVED						MEMRETSTATE		RESERVED				LOGICRETSTATE		POWERSTATE	

Bits	Field Name	Description	Type	Reset
31:18	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000
17:16	MEMONSTATE	Memory state when ON 0x3: Memory is always ON when domain is ON.	R	0x3
15:9	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00
8	MEMRETSTATE	Memory state when RETENTION 0x1: Memory is always retained when domain is in RETENTION state.	R	0x1
7:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00
2	LOGICRETSTATE	Logic state when domain is RETENTION 0x0: Logic build with retention flip-flop (GPIO) is retained and remaining logic is OFF when domain is in RETENTION state. 0x1: Logic is retained when domain is in RETENTION state.	RW	0x1
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: reserved 0x3: ON State	RW	0x3

**4.14.2.11.8 PM\_PWSTST\_PER**

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
2	LASTLOGICSTATEENTERED	Last logic state entered 0x0: PER domain logic was previously OFF 0x1: PER domain logic was previously ON	RW	0x0
1:0	LASTPOWERSTATEENTERED	Last power state entered 0x0: PER domain was previously OFF 0x1: PER domain was previously in RETENTION 0x2: PER domain was previously INACTIVE 0x3: PER domain was previously ON	RW	0x0

## 4.14.2.12 EMU\_PRM Register Descriptions

### 4.14.2.12.1 RM\_RSTST\_EMU

**Table 4-282. RM\_RSTST\_EMU**

<b>Address Offset</b>	0x0000 0058		
<b>Physical Address</b>	0x4830 7158	<b>Instance</b>	EMU_PRM
<b>Description</b>	This register logs the different reset sources of the EMU domain. Each bit is set upon release of the domain reset signal. Must be cleared by software.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
RESERVED																																		

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
2	DOMAINWKUP_RST	Power domain wake-up reset 0x0: Status bit unchanged 0x0: No power domain wake-up reset. 0x1: Status bit is cleared to 0 0x1: EMULATION domain has been reset following an EMULATION power domain wake-up.	RW	0x0
1	GLOBALWARM_RST	Global warm reset 0x0: Status bit unchanged 0x0: No global warm reset. 0x1: Status bit is cleared to 0 0x1: MPU domain has been reset upon a global warm reset	RW	0x0
0	GLOBALCOLD_RST	Global cold reset 0x0: No global cold reset. 0x0: Status bit unchanged 0x1: MPU domain has been reset upon a global cold reset 0x1: Status bit is cleared to 0	RW	0x1

**4.14.2.12.2 PM\_PWSTST\_EMU**
**Table 4-283. PM\_PWSTST\_EMU**

<b>Address Offset</b>	0x0000 00E4	<b>Instance</b>	EMU_PRM
<b>Physical Address</b>	0x4830 71E4		
<b>Description</b>	This register provides a status on the power state transition of the EMULATION domain.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								INTRANSITION	RESERVED																POWERSTATEST						

Bits	Field Name	Description	Type	Reset
31:21	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000
20	INTRANSITION	Domain transition status 0x0: No transition 0x1: EMULATION power domain transition is in progress.	R	0x0
19:2	RESERVED	Write 0x0040 for future compatibility. Read returns 0x0040.	R	0x00040
1:0	POWERSTATEST	Current power state status 0x0: Power domain is OFF 0x1: Reserved 0x2: Reserved 0x3: Power domain is ON	R	0x3

### 4.14.2.13 Global\_Reg\_PRM Register Descriptions

#### 4.14.2.13.1 PRM\_VC\_SMPS\_SA

**Table 4-284. PRM\_VC\_SMPS\_SA**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	Global_Reg_PRM
<b>Physical Address</b>	0x4830 7220		
<b>Description</b>	This register allows the setting of the I <sup>2</sup> C slave address of the Power IC device.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								SA1								RESERVED								SA0							

Bits	Field Name	Description	Type	Reset
31:23	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x000
22:16	SA1	Set the I <sup>2</sup> C slave address value for the second (if any) Power IC device.	RW	0x00
15:7	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x000
6:0	SA0	Set the I <sup>2</sup> C slave address value for the first Power IC device.	RW	0x00

#### 4.14.2.13.2 PRM\_VC\_SMPS\_VOL\_RA

**Table 4-285. PRM\_VC\_SMPS\_VOL\_RA**

<b>Address Offset</b>	0x0000 0024	<b>Instance</b>	Global_Reg_PRM
<b>Physical Address</b>	0x4830 7224		
<b>Description</b>	This register allows the setting of the voltage configuration register address for the VDD channels.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								VOLRA1								RESERVED								VOLRA0							

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x00
23:16	VOLRA1	Set the voltage configuration register address value for the second VDD channel (VDD2).	RW	0x00
15:8	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x00
7:0	VOLRA0	Set the voltage configuration register address value for the first VDD channel (VDD1).	RW	0x00

**4.14.2.13.3 PRM\_VC\_SMPS\_CMD\_RA**
**Table 4-286. PRM\_VC\_SMPS\_CMD\_RA**

<b>Address Offset</b>	0x0000 0028		
<b>Physical Address</b>	0x4830 7228	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows the setting of the ON/Retention/OFF command configuration register address for the VDD channels. It is used if the Power IC device has different register addresses for voltage value and ON/Retention/OFF command.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CMDRA1								RESERVED								CMDRA0							

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x00
23:16	CMDRA1	Set the ON/ON-LP/Retention/OFF command configuration register address value for the second VDD channel (VDD2).	RW	0x00
15:8	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x00
7:0	CMDRA0	Set the ON/ON-LP/Retention/OFF command configuration register address value for the first VDD channel (VDD1).	RW	0x00

**4.14.2.13.4 PRM\_VC\_CMD\_VAL\_0**
**Table 4-287. PRM\_VC\_CMD\_VAL\_0**

<b>Address Offset</b>	0x0000 002C		
<b>Physical Address</b>	0x4830 722C	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows the setting of the ON/Retention/OFF voltage level values for the first VDD channel.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ON								ONLP								RET								OFF							

Bits	Field Name	Description	Type	Reset
31:24	ON	Set the ON voltage level value for the first VDD channel (VDD1).	RW	0x00
23:16	ONLP	Set the ON-LP voltage level value for the first VDD channel (VDD1).	RW	0x00
15:8	RET	Set the RET voltage level value for the first VDD channel (VDD1).	RW	0x00
7:0	OFF	Set the OFF voltage level value for the first VDD channel (VDD1).	RW	0x00

#### 4.14.2.13.5 PRM\_VC\_CMD\_VAL\_1

**Table 4-288. PRM\_VC\_CMD\_VAL\_1**

<b>Address Offset</b>	0x0000 0030		
<b>Physical Address</b>	0x4830 7230	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows the setting of the ON/Retention/OFF voltage level values for the second VDD channel. It is used if the second channel has different values than the first channel.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ON								ONLP								RET								OFF							

Bits	Field Name	Description	Type	Reset
31:24	ON	Set the ON voltage level value for the second VDD channel (VDD2).	RW	0x00
23:16	ONLP	Set the ON-LP voltage level value for the second VDD channel (VDD2).	RW	0x00
15:8	RET	Set the RET voltage level value for the second VDD channel (VDD2).	RW	0x00
7:0	OFF	Set the OFF voltage level value for the second VDD channel (VDD2).	RW	0x00

**4.14.2.13.6 PRM\_VC\_CH\_CONF**
**Table 4-289. PRM\_VC\_CH\_CONF**

<b>Address Offset</b>	0x0000 0034	<b>Instance</b>	Global_Reg_PRM
<b>Physical Address</b>	0x4830 7234		
<b>Description</b>	This register allows the configuration pointers for both VDD channels.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CMD1	RACEN1	RAC1	RAV1	SA1	RESERVED								CMD0	RACEN0	RAC0	RAV0	SA0						

Bits	Field Name	Description	Type	Reset
31:21	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x000
20	CMD1	Selects the ON/ON-LP/Retention/OFF voltage values for the second VDD channel (VDD2).	RW	0x0
19	RACEN1	Enable bit for usage of RAC1.	RW	0x0
18	RAC1	Set the ON/ON-LP/Retention/OFF command configuration register address pointer for the second VDD channel (VDD2).	RW	0x0
17	RAV1	Set the voltage configuration register address pointer for the second VDD channel (VDD2).	RW	0x0
16	SA1	Set the slave address pointer for the second VDD channel (VDD2).	RW	0x0
15:5	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x000
4	CMD0	Selects the ON/ON-LP/Retention/OFF voltage values for the first VDD channel (VDD1).	RW	0x0
3	RACEN0	Enable bit for usage of RAC0.	RW	0x0
2	RAC0	Set the ON/ON-LP/Retention/OFF command configuration register address pointer for the first VDD channel (VDD1).	RW	0x0
1	RAV0	Set the voltage configuration register address pointer for the first VDD channel (VDD1).	RW	0x0
0	SA0	Set the slave address pointer for the first VDD channel (VDD1).	RW	0x0

**4.14.2.13.7 PRM\_VC\_I2C\_CFG**
**Table 4-290. PRM\_VC\_I2C\_CFG**

<b>Address Offset</b>	0x0000 0038		
<b>Physical Address</b>	0x4830 7238	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows the configuration pointers for both VDD channels.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																HMASTER	SREN	HSEN	MCODE												

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Write 0's for future compatibility. Read is undefined.	R	0x00000000
5	HMASTER	Put the I2C pads in a low power mode in case of light load. 0x0: Disables the I2C pads low power mode 0x1: Enables the I2C pads low power mode	RW	0x0
4	SREN	Enables the I2C repeated start operation mode. 0x0: Disables the repeated start operation mode 0x1: Enables the repeated start operation mode	RW	0x1
3	HSEN	Enables I2C bus High Speed mode. 0x0: Disables the I2C high speed mode 0x1: Enables the I2C high speed mode	RW	0x1
2:0	MCODE	Master code value for I2C High Speed preamble transmission.	RW	0x0

**4.14.2.13.8 PRM\_VC\_BYPASS\_VAL**
**Table 4-291. PRM\_VC\_BYPASS\_VAL**

<b>Address Offset</b>	0x0000 003C	<b>Instance</b>	Global_Reg_PRM
<b>Physical Address</b>	0x4830 723C		
<b>Description</b>	This register allows the programming of the Power IC device using the bypass interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RESERVED								VALID	DATA								REGADDR								RESERVED	SLAVEADDR							

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Write 0's for future compatibility. Read is undefined.	RW	0x00
24	VALID	This bit validates the bypass command. It is automatically cleared by hardware either after getting the acknowledge back from the SMPS or if an error occurred. 0x0: Reserved 0x0: The last command send has been acknowledged 0x1: The Voltage Controller send the command to the I2C interface 0x1: Pending command is being process	RW	0x0
23:16	DATA	Data to send to the Power IC device.	RW	0x00
15:8	REGADDR	Set the address of Power IC device register to configure.	RW	0x00
7	RESERVED	Write 0's for future compatibility. Read is undefined.	RW	0x0
6:0	SLAVEADDR	Set the I2C slave address value.	RW	0x00

**4.14.2.13.10 PRM\_RSTTIME**
**Table 4-293. PRM\_RSTTIME**

<b>Address Offset</b>	0x0000 0054	<b>Instance</b>	Global_Reg_PRM
<b>Physical Address</b>	0x4830 7254		
<b>Description</b>	Reset duration control.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RSTTIME2						RSTTIME1									

Bits	Field Name	Description	Type	Reset
31:13	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000
12:8	RSTTIME2	(Power domain) reset duration 2 (number of RM.ICLK clock cycles)	RW	0x10
7:0	RSTTIME1	(Global) reset duration 1 (number of Func_32k.clk clock cycles)	RW	0x06

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
6	EXTERNAL_WARM_RST	External warm reset event 0x0: Status bit unchanged 0x0: No global warm reset. 0x1: Status bit is cleared to 0 0x1: Global external warm reset has occurred.	RW	0x0
5	SECURE_WD_RST	Secure watchdog reset event 0x0: Status bit unchanged 0x0: No security watchdog reset. 0x1: Status bit is cleared to 0 0x1: Security watchdog reset has occurred.	RW	0x0
4	MPU_WD_RST	MPU watchdog reset event 0x0: Status bit unchanged 0x0: No MPU watchdog reset. 0x1: MPU watchdog reset has occurred. 0x1: Status bit is cleared to 0	RW	0x0
3	SECURITY_VIOL_RST	Security violation reset event 0x0: Status bit unchanged 0x0: No security violation reset. 0x1: Status bit is cleared to 0 0x1: Security violation reset has occurred.	RW	0x0
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1	GLOBAL_SW_RST	Global software reset event 0x0: No global software reset. 0x0: Status bit unchanged 0x1: Global software reset has occurred. 0x1: Status bit is cleared to 0	RW	0x0
0	GLOBAL_COLD_RST	Power-up (cold) reset event 0x0: No power-on reset. 0x0: Status bit unchanged 0x1: Power-on reset has occurred. 0x1: Status bit is cleared to 0	RW	0x1

**4.14.2.13.12 PRM\_VOLTCTRL**
**Table 4-295. PRM\_VOLTCTRL**

<b>Address Offset</b>	0x0000 0060		
<b>Physical Address</b>	0x4830 7260	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows a direct control on the external power IC.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RESERVED																												SEL_VMODE	SEL_OFF	AUTO_OFF	AUTO_RET	AUTO_SLEEP

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000000
4	SEL_VMODE	This bit allows to select the mode used to control the Power IC (I2C or VMODE). 0x0: The Power IC is controlled through the SR dedicated I2C interface. 0x1: The Power IC is controlled through the VMODE interface.	RW	0x0
3	SEL_OFF	This bit allows to select the mode used to send the OFF command. 0x0: The OFF command is send through the voltage controller I2C interface. 0x1: The signal SYS.OFF_MODE is asserted.	RW	0x0
2	AUTO_OFF	This bit allows to send an OFF command to the Power IC. 0x0: The OFF command is not send. 0x1: The OFF command is automatically send when the voltage domain is in the appropriate standby mode.	RW	0x0
1	AUTO_RET	This bit allows to send a RETENTION command to the Power IC through the voltage controller I2C interface. 0x0: The RETENTION command is not send. 0x1: The RETENTION command is automatically send when the voltage domain is in the appropriate standby mode.	RW	0x0
0	AUTO_SLEEP	This bit allows to send a SLEEP command to the Power IC through the voltage controller I2C interface. 0x0: The SLEEP command is not send. 0x1: The SLEEP command is automatically send when the voltage domain is in the appropriate standby mode.	RW	0x0

**4.14.2.13.13 PRM\_SRAM\_PCHARGE**
**Table 4-296. PRM\_SRAM\_PCHARGE**

<b>Address Offset</b>	0x0000 0064		
<b>Physical Address</b>	0x4830 7264	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows setting the pre-charge time of the SRAM.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																PCHARGE_TIME															

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
7:0	PCHARGE_TIME	Number of system clock cycles for the SRAM pre-charge duration.	RW	0x50

#### 4.14.2.13.14 PRM\_CLKSRC\_CTRL

**Table 4-297. PRM\_CLKSRC\_CTRL**

<b>Address Offset</b>	0x0000 0070		
<b>Physical Address</b>	0x4830 7270	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register provides control over the device source clock.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SYSCLKDIV	RESERVED	AUTOEXTCLKMODE	RESERVED	SYSCLKSEL											

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000000
7:6	SYSCLKDIV	This field controls the system clock input divider 0x0: reserved 0x1: Syst_clk is external clock / 1 0x2: Syst_clk is external clock / 2 0x3: reserved	RW	0x1
5	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
4:3	AUTOEXTCLKMODE	This field allows to control the external clock request (CLKREQ) and the oscillator 0x0: CLKREQ is kept asserted or the oscillator is always active (in master mode) 0x1: CLKREQ is de-asserted or the oscillator is put in power-down mode (in master mode) when all the voltages domains are SLEEP, RETENTION or OFF states. 0x2: CLKREQ is de-asserted or the oscillator is put in power-down mode (in master mode) when all the voltages domains are RETENTION or OFF states. 0x3: CLKREQ is de-asserted or the oscillator is put in power-down mode (in master mode) only when all the voltage domains are in OFF states.	RW	0x0
2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0
1:0	SYSCLKSEL	This field reflects the mode of the oscillator. It is automatically set accordingly to the external tied-off configuration and its value is insignificant before the release of the power-on reset. 0x0: Bypass mode: the system clock is issued from an external square clock source 0x1: Oscillator mode: the system clock is issued from an external quartz 0x2: Reserved 0x3: Unknown state (not know before release of the power-on reset)	R	0x3

**4.14.2.13.15 PRM\_OBS**
**Table 4-298. PRM\_OBS**

<b>Address Offset</b>	0x0000 0080		
<b>Physical Address</b>	0x4830 7280	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register logs the observable signals (18 bits). This register is intended to be read through the debugger interface when the device is in OFF mode.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														OBS_BUS																	

Bits	Field Name	Description	Type	Reset
31:18	RESERVED	Read is undefined.	R	0x0000
17:0	OBS_BUS	Indicates the current value on the observable bus.	R	0x00000

**4.14.2.13.16 PRM\_VOLTSETUP1**
**Table 4-299. PRM\_VOLTSETUP1**

<b>Address Offset</b>	0x0000 0090		
<b>Physical Address</b>	0x4830 7290	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows setting the setup time of the VDD1 and VDD2 regulators. This register is used when exiting OFF/RET/SLEEP mode (or enters OFF/RET/SLEEP mode) and when OMAP manages the sequencing of the voltages regulation steps.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SETUP_TIME2														SETUP_TIME1																	

Bits	Field Name	Description	Type	Reset
31:16	SETUP_TIME2	The value, in number of cycles of SYS_CLK, determines the setup duration of VDD2 regulator. The setup duration is computed as = 8 x number of cycles of SYS_CLK set in the register bit field.	RW	0x0000
15:0	SETUP_TIME1	The value, in number of cycles of SYS_CLK, determines the setup duration of VDD1 regulator. The setup duration is computed as = 8 x number of cycles of SYS_CLK set in the register bit field.	RW	0x0000

#### 4.14.2.13.17 PRM\_VOLTOFFSET

**Table 4-300. PRM\_VOLTOFFSET**

<b>Address Offset</b>	0x0000 0094		
<b>Physical Address</b>	0x4830 7294	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows controlling the sys_offmode signal upon wake-up from OFF mode when the OFF sequence is supervised by the Power IC. This register allows setting the offset-time to de-assert sys_offmode when exiting the OFF mode.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																OFFSET_TIME															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000
15:0	OFFSET_TIME	Number of 32kHz clock cycles for the OFF mode offset time	RW	0x0000

#### 4.14.2.13.18 PRM\_CLKSETUP

**Table 4-301. PRM\_CLKSETUP**

<b>Address Offset</b>	0x0000 0098		
<b>Physical Address</b>	0x4830 7298	<b>Instance</b>	Global_Reg_PRM
<b>Description</b>	This register allows setting the setup time of the oscillator system clock (sys_clk), based on number of 32 kHz clock cycles.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SETUP_TIME															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0000
15:0	SETUP_TIME	Number of 32kHz clock cycles for the SETUP duration	RW	0x0000

**4.14.2.14.2 PM\_WKDEP\_NEON**
**Table 4-305. PM\_WKDEP\_NEON**

<b>Address Offset</b>	0x0000 00C8		
<b>Physical Address</b>	0x4830 73C8	<b>Instance</b>	NEON_PRM
<b>Description</b>	This register allows enabling or disabling the wake-up of the NEON domain upon another domain wakeup.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																EN_MPU		RESERVED													

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1	EN_MPU	MPU domain dependency 0x0: NEON domain is independent of MPU domain wake-up. 0x1: NEON domain is woken-up upon MPU domain wake-up.	RW	0x1
0	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x0

**4.14.2.14.3 PM\_PWSTCTRL\_NEON**
**Table 4-306. PM\_PWSTCTRL\_NEON**

<b>Address Offset</b>	0x0000 00E0	<b>Instance</b>	NEON_PRM
<b>Physical Address</b>	0x4830 73E0		
<b>Description</b>	This register controls the NEON domain power state transition.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																LOGICRETSTATE		POWERSTATE													

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
2	LOGICRETSTATE	Logic state when RETENTION 0x1: Logic is always retained when domain is in RETENTION state.	R	0x1
1:0	POWERSTATE	Power state control 0x0: OFF state 0x1: RETENTION state 0x2: reserved 0x3: ON State	RW	0x3

**4.14.2.14.4 PM\_PWSTST\_NEON**
**Table 4-307. PM\_PWSTST\_NEON**

<b>Address Offset</b>	0x0000 00E4		
<b>Physical Address</b>	0x4830 73E4	<b>Instance</b>	NEON_PRM
<b>Description</b>	This register provides a status on the power state transition of the NEON domain.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED											INTRANSITION	RESERVED											POWERSTATEST								

Bits	Field Name	Description	Type	Reset
31:21	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x000
20	INTRANSITION	Domain transition status 0x0: No transition 0x1: NEON power domain transition is in progress.	R	0x0
19:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000
1:0	POWERSTATEST	Current power state status 0x0: Power domain is OFF 0x1: Power domain is in RETENTION 0x2: Power domain is INACTIVE 0x3: Power domain is ON	R	0x3

**4.14.2.14.5 PM\_PREPWSTST\_NEON**
**Table 4-308. PM\_PREPWSTST\_NEON**

<b>Address Offset</b>	0x0000 00E8		
<b>Physical Address</b>	0x4830 73E8	<b>Instance</b>	NEON_PRM
<b>Description</b>	This register provides a status on the NEON domain previous power state. It indicates the state entered during the last sleep transition.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																LASTPOWERSTATEENTERED															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
1:0	LASTPOWERSTATEENTERED	Last power state entered 0x0: NEON domain was previously OFF 0x1: NEON domain was previously in RETENTION 0x2: NEON domain was previously INACTIVE 0x3: NEON domain was previously ON	RW	0x0

### 4.14.2.15 USBHOST\_PRM Register Descriptions

#### 4.14.2.15.1 RM\_RSTST\_USBHOST

**Table 4-309. RM\_RSTST\_USBHOST**

<b>Address Offset</b>	0x0000 0058	<b>Instance</b>	USBHOST_PRM
<b>Physical Address</b>	0x4830 7458		
<b>Description</b>	This register logs the different reset sources of the USB HOST domain. Each bit is set upon release of the domain reset signal. Must be cleared by software.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																COREDOMAINWKUP_RST	DOMAINWKUP_RST	GLOBALWARM_RST	GLOBALCOLD_RST												

Bits	Field Name	Description	Type	Reset
31:4	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
3	COREDOMAINWKUP_RST	CORE domain wake-up reset 0x0: No power domain wake-up reset. 0x0: Status bit unchanged 0x1: Status bit is cleared to 0 0x1: USB HOST domain has been reset following a CORE power domain wake-up from OFF to ON.	RW	0x0
2	DOMAINWKUP_RST	Power domain wake-up reset 0x0: Status bit unchanged 0x0: No power domain wake-up reset. 0x1: USB HOST domain has been reset following an USB HOST power domain wake-up. 0x1: Status bit is cleared to 0	RW	0x0
1	GLOBALWARM_RST	Global warm reset 0x0: Status bit unchanged 0x0: No global warm reset. 0x1: USB HOST domain has been reset upon a global warm reset 0x1: Status bit is cleared to 0	RW	0x0
0	GLOBALCOLD_RST	Global cold reset 0x0: No global cold reset. 0x0: Status bit unchanged 0x1: USB HOST domain has been reset upon a global cold reset 0x1: Status bit is cleared to 0	RW	0x1

#### 4.14.2.15.2 PM\_WKEN\_USBHOST

**Table 4-310. PM\_WKEN\_USBHOST**

<b>Address Offset</b>	0x0000 00A0		
<b>Physical Address</b>	0x4830 74A0	<b>Instance</b>	USBHOST_PRM
<b>Description</b>	This register allows enabling/disabling modules wake-up events.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												EN_USBHOST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	EN_USBHOST	USB HOST Wake-up enable 0x0: USB HOST wake-up is disabled 0x1: USB HOST wake-up event is enabled	RW	0x1

#### 4.14.2.15.3 PM\_MPUGRPSEL\_USBHOST

**Table 4-311. PM\_MPUGRPSEL\_USBHOST**

<b>Address Offset</b>	0x0000 00A4		
<b>Physical Address</b>	0x4830 74A4	<b>Instance</b>	USBHOST_PRM
<b>Description</b>	This register allows selecting the group of modules that wake-up the MPU.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												GRPSEL_USBHOST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	GRPSEL_USBHOST	Select the USBHOST in the MPU wake-up events group 0x0: USBHOST is not attached to the MPU wake-up events group. 0x1: USBHOST is attached to the MPU wake-up events group.	RW	0x1

**4.14.2.15.4 PM\_IVA2GRPSEL\_USBHOST**
**Table 4-312. PM\_IVA2GRPSEL\_USBHOST**

<b>Address Offset</b>	0x0000 00A8		
<b>Physical Address</b>	0x4830 74A8	<b>Instance</b>	USBHOST_PRM
<b>Description</b>	This register allows selecting the group of modules that wake-up the IVA2.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												GRPSEL_USBHOST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	GRPSEL_USBHOST	Select the USBHOST in the IVA2 wake-up events group 0x0: USBHOST is not attached to the IVA2 wake-up events group. 0x1: USBHOST is attached to the IVA2 wake-up events group.	RW	0x1

**4.14.2.15.5 PM\_WKST\_USBHOST**
**Table 4-313. PM\_WKST\_USBHOST**

<b>Address Offset</b>	0x0000 00B0		
<b>Physical Address</b>	0x4830 74B0	<b>Instance</b>	USBHOST_PRM
<b>Description</b>	This register logs the modules wake-up events. Must be cleared by software. It prevents further domain transition if it is not cleared.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												ST_USBHOST			

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Write 0's for future compatibility. Read returns 0.	R	0x00000000
0	ST_USBHOST	USB HOST Wake-up status 0x0: USB HOST wake-up has not occurred or was masked. 0x0: Status bit unchanged 0x1: USB HOST wake-up has occurred. 0x1: Status bit is cleared to 0	RW	0x0

**4.14.2.15.6 PM\_WKDEP\_USBHOST**
**Table 4-314. PM\_WKDEP\_USBHOST**

<b>Address Offset</b>	0x0000 00C8	<b>Instance</b>	USBHOST_PRM
<b>Physical Address</b>	0x4830 74C8		
<b>Description</b>	This register allows enabling or disabling the wake-up of the USB HOST domain upon another domain wakeup.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1:0	LASTPOWERSTATEENTERED	Last power state entered 0x0: USB HOST domain was previously OFF 0x1: USB HOST domain was previously in RETENTION 0x2: USB HOST domain was previously INACTIVE 0x3: USB HOST domain was previously ON	RW	0x0

## 4.15 Revision History

[Table 4-318](#) lists the changes made since the previous version of this document.

**Table 4-318. Document Revision History**

<b>Reference</b>	<b>Additions/Modifications/Deletions</b>
Global	Changed OFF_MODE to SYS_OFF_MODE.
<a href="#">Figure 4-42</a>	Changed figure.
<a href="#">Section 4.7.6.3</a>	Changed 2nd bulleted list.
<a href="#">Table 4-82</a>	Added note after table.
<a href="#">Table 4-85</a>	Modified table and added table note.
<a href="#">Table 4-86</a>	Modified table.
<a href="#">Section 4.11.4.1.1</a>	Changed ordered list.
<a href="#">Section 4.11.4.2.1</a>	Changed ordered list.
<a href="#">Section 4.12.5.1.1</a>	Changed 5th bullet.
<a href="#">Section 4.12.5.1.2</a>	Changed 1st and 2nd paragraph.
<a href="#">Figure 4-87</a>	Changed figure and figure note.
<a href="#">Section 4.14.1.2.2</a>	Changed bit descriptions.
<a href="#">Section 15.7.3.28</a>	Changed bit descriptions.
<a href="#">Section 15.7.7.3</a>	Chagned bit descriptions.
<a href="#">Section 4.14.1.8.2</a>	Changed bit descriptions.

## **Interconnect**

This chapter describes the Interconnect.

**NOTE:**

- The L3 interconnect is an instantiation of the **SonicsMX**® interconnect from **Sonics, Inc.**
- The L4 interconnects are instantiations of the **Sonics3220**™ interconnect from **Sonics, Inc.**

## 5.1 Interconnect Overview

This chapter gives information about all modules and features in the high-tier device. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

### 5.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- Initiator: Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- Target: Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

---

**NOTE:** A module can have several separate ports; therefore, a module can be both an initiator and a target.

---

- Agent: Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- OCP: Open-core protocol ([www.ocpip.org](http://www.ocpip.org)) is point-to-point standard protocol between one master port and one slave port.
- OCP master port: Port that can generate OCP commands. An initiator includes at least one master port.
- OCP slave port: Port that responds to OCP commands. A target includes one slave port.
- Interconnect: The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- Register target (RT): Special TA used to access the interconnect internal configuration registers.
- Dataflow signal: Any OCP signal that is part of a clearly identified OCP transfer or dataflow (typically: command, address, byte enables, etc.). The signal behavior is defined by the OCP protocol semantics.
- Sideband signal: Any OCP signal whose behavior is not associated to a precise OCP transaction or dataflow. The OCP standard does not define specific semantics for these signals.icnt
- Out-of-band error: Any OCP signal whose behavior is associated to an error-reporting scheme of the device, as opposed to in-band errors.

---

**NOTE:** Interrupt requests and DMA requests are not routed by the interconnect in the device.

---

- Firewall: A programmable security feature integrated in a target agent for each module requiring a secure data path. A firewall can be configured using three criteria:
  - Initiator requesting access
  - Address space access
  - Type of access
- Thread: Logical entities that allow to have separate independent data flows on a single port.
- Multithreaded ports: A physical port able to simultaneously handle several outstanding transactions. On a multithreaded port, one physical channel (port) is used concurrently for several logical channels (threads). The transfer in each thread must remain in order with respect to each other, but the order between threads can change between requests and responses. Thread management is used for performance optimization purposes and is automatically handled by the system.
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which

uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted inband with the request and is used for security and error-logging mechanism.

- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCmd qualifier: Command bus that indicates the type of transfer requested. [Table 5-1](#) lists the commands encoded.

**Table 5-1. MCmd Qualifier Description**

MCmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Not used
1 0 1	Write nonposted
1 1 0	Not used
1 1 1	Not used

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 5-2](#).

**Table 5-2. MReqInfo Qualifier Description**

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access
MReqSecure	0: Public transaction
	1: Secure transaction <sup>(1)</sup>

<sup>(1)</sup> In GP device MReqSecure = 1 (Secure value), is not supported.

- L3\_PM\_REQ\_INFO\_PERMISSION\_i: Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction.

**Table 5-3. SResp Qualifier Description**

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

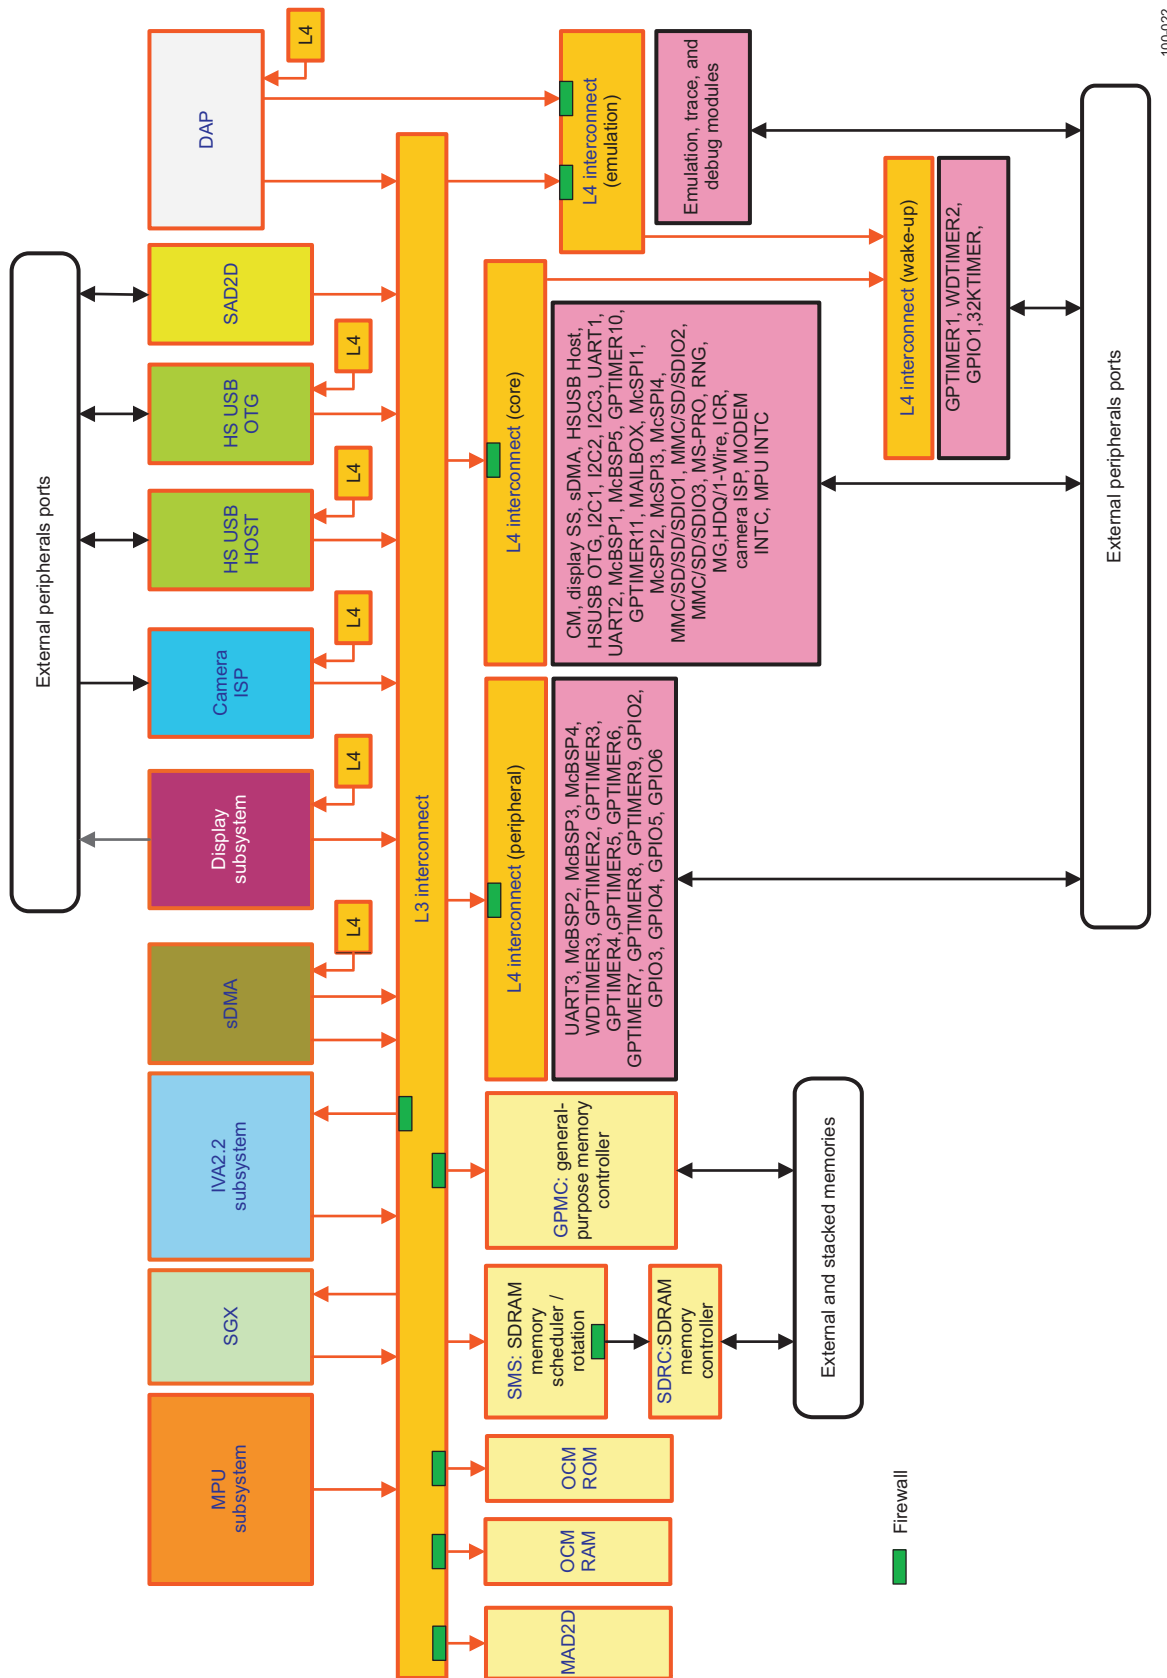

### 5.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 is internal to the CPUs. It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core and the IVA2.2 core.
- L2 is included in the IVA2.2 subsystem and the MPU subsystem.

- The chip-level interconnect consists of one L3 interconnect and four L4 interconnects. It enables communication among the modules and subsystems in the device. [Figure 5-1](#) shows an overview of the L3 and L4 interconnect architecture.
  - L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 64 bits from the initiator to the target. The L3 interconnect is a little-endian platform
  - L4 is composed of the L4-Core, L4-Per, L4-Wakeup, and L4-Emu interconnects and handles data transfers to peripherals. It supports 32-bit data width transfer and is optimized to support the interconnection of many peripheral targets. These backplanes assume little-endian transactions for narrower targets (8-bit, 16-bit) when doing data packing and unpacking.

Figure 5-1. Interconnect Architecture Overview

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access depending on the characteristics of the module.

To secure a data path, some TAs include configurable firewalls (FWs) for security purposes. A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default setting is fully functional; it enables all possible functional data paths and a minimal default security setting. However, it is possible to modify the interconnect parameters to fit user expectations.

### 5.1.3 Module Distribution

IAs and TAs provide the interface to connect the different modules and the interconnect.

[Table 5-4](#) through [Table 5-13](#) list the device modules, subsystems, and associated agents. The agents are listed for each interconnect domain:

- L3 initiator and target agents
- L4-Core initiator and target agents
- L4-Per initiator and target agents
- L4-Emu initiator and target agents
- L4-Wakeup initiator and target agents

#### 5.1.3.1 L3 Interconnect Agents

[Table 5-4](#) and [Table 5-5](#) list the IAs and TAs, respectively, of the L3 interconnect.

**Table 5-4. L3 Initiator Agents**

Module Name	Description
MPU SS	MPU subsystem port
Display SS	Display subsystem port
IVA2.2 SS	IVA2.2 subsystem port
SGX SS	Graphics subsystem port
CAMERA SS	Camera subsystem port
SAD2D	Die-to-die port
sDMA read	System DMA read port
sDMA write	System DMA write port
High-Speed (HS) USB OTG	Universal Serial Bus High-Speed port OTG Controller
High-Speed (HS) USB Host	Universal serial bus High-Speed port Host Controller
DAP	Debug access port (JTAG/Emulation access to system resources)

**Table 5-5. L3 Target Agents**

Module Name	Description
SMS	SDRAM memory scheduler port
GPMC	General-purpose memory controller (for flash memory, SRAM, SROM, etc.) port
OCM-ROM	On-chip memory ROM port
OCM-RAM	On-chip memory RAM port
SGX	Graphics subsystem port
IVA2.2	Image video and audio accelerator subsystem port
RT	Register target port to configure L3
L4-Core	Port for L4-Core interconnect
L4-Peripherals	Port for L4-Per interconnect

**Table 5-5. L3 Target Agents (continued)**

Module Name	Description
L4-Emu	Port for L4-Emu interconnect

For more details on the register target module, see [Section 5.4.2, Register Target](#).

### 5.1.3.2 L4-Core Agents

**Table 5-6. L4-Core Initiator Agent**

Module Name	Description
L3 interconnect	L3 interconnect port

**NOTE:** A unique L3 port is used for communication with the L4-Core. For the list of initiators allowed to access the L4 Core peripherals, see [Table 5-14](#).

**Table 5-7. L4-Core Target Agents**

Module Name	Description
Display subsystem	Display subsystem configuration port
Camera subsystem	Camera subsystem port
High-Speed (HS) USB OTG	Universal serial bus High-speed port OTG
High-Speed (FS) USB Host	Universal serial bus High-Speed port Host controller
UART1	Universal asynchronous receiver transmitter port 1
UART2	Universal asynchronous receiver transmitter port 2
I2C1	Multimaster interintegrated circuit 1
I2C2	Multimaster interintegrated circuit 2
I2C3	Multimaster interintegrated circuit 3
McBSP1	Multichannel buffered serial port 1
McBSP5	Multichannel buffered serial port 5
GPTIMER10	General-purpose timer 10
GPTIMER11	General-purpose timer 11
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2
MMCHS1	Multimedia memory controller SDIO 1
MMCHS2	Multimedia memory controller SDIO 2
MMCHS3	Multimedia memory controller SDIO 3
HDQ/1-Wire	Single wire serial link low rate
MS-PRO	Memory Stick PRO™
MLB (Mailbox)	Mailbox
RNG1	Random number generator 1
RNG2	Random number generator 2
D3D1	Data encryption standard 1
D3D2	Data encryption standard 2
SHAM1	Secure hash algorithm 1 and message digest 5
SHAM2	Secure hash algorithm 2 and message digest 5
AES1	Advanced encryption
AES2	Advanced encryption
MG	MagicGate®
FastPKA	Public key access

**Table 5-7. L4-Core Target Agents (continued)**

Module Name	Description
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2
SPI3	Serial peripheral interface 3
SPI4	Serial peripheral interface 4
sDMA	System DMA controller
L4-Wakeup	L4-Wakeup interconnect
CM	Clock manager
SCM	System control module

### 5.1.3.3 L4-Per Agents

**Table 5-8. L4-Per Initiator Agent**

Module Name	Description
L3 interconnect	L3 interconnect port

**NOTE:** A unique L3 port is used for communication with L4-Per. For the list of initiators allowed to access the L4-Per peripherals, see [Table 5-14](#).

**Table 5-9. L4-Per Target Agents**

Module Name	Description
UARTIrDA	Universal asynchronous receiver/transmitter and infrared data association port
McBSP2	Multichannel buffered serial port 2
McBSP3	Multichannel buffered serial port 3
GPTIMER2	General-purpose timer 2
GPTIMER3	General-purpose timer 3
GPTIMER4	General-purpose timer 4
GPTIMER5	General-purpose timer 5
GPTIMER6	General-purpose timer 6
GPTIMER7	General-purpose timer 7
GPTIMER8	General-purpose timer 8
GPTIMER9	General-purpose timer 9
GPIO2	General-purpose I/O 2
GPIO3	General-purpose I/O 3
GPIO4	General-purpose I/O 4
GPIO5	General-purpose I/O 5
GPIO6	General-purpose I/O 6

### 5.1.3.4 L4-Emu Agents

**Table 5-10. L4-Emu Initiator Agents**

Module Name	Description
L3 interconnect	L3 interconnect port
DAP	DAP port

**NOTE:** The L3 and DAP ports are used for communication with L4-Emu. For the list of initiators allowed to access the L4-Emu peripherals, see [Table 5-14](#).

**Table 5-11. L4-Emu Target Agents**

Module Name	Description
L4-Wakeup	L4 wake-up interconnect
SDTI	System debug trace interface
ETB	Embedded trace buffer
TPIU	Trace port interface unit
MPU	ARM9
DAPCTL	Debug access port

### 5.1.3.5 L4-Wakeup Agents

**Table 5-12. L4-Wakeup Initiator Agent**

Module Name	Description
L4-Core interconnect	L4-Core interconnect port
L4-Emu interconnect	L4-Emulation interconnect port

**NOTE:** The L4-Emu and L4-Core ports are used to communicate with the L4-Wakeup. For the list of initiators allowed to access the L4-Wakeup peripherals, see [Table 5-14](#).

**Table 5-13. L4-Wakeup Target Agents**

Module Name	Description
PRM	Power reset management
GPIO1	General-purpose I/O 1
GPTIMER1	General-purpose timer 1
GPTIMER12 <sup>(1)</sup>	General-purpose timer 12
WDTIMER1 <sup>(1)</sup>	Secure watchdog timer
WDTIMER2	MPU subsystem watchdog timer
32KTIMER	32-kHz timer
USIM	Universal Subscriber Identity Module

<sup>(1)</sup> Not available in GP device.

### 5.1.4 Connectivity Matrix

Table 5-14 lists the functional paths between the L3 interconnect initiator modules and the L3 and L4 TAs. The functional paths are indicated by the use of the following:

- Cell contains a + sign when a functional path exists.
- Cell is blank when no functional path exists.

**Table 5-14. Connectivity Matrix**

Initiator Ports	L4-Core Target <sup>(1)</sup>	L4-Per Target <sup>(1)</sup>	L4-Emu Target <sup>(1)</sup>	L4-Wakeup Target <sup>(1)</sup>	SMS Target	GPMC Target	OCM RAM Target	OCM ROM Target	RT Target	IVA2.2 Target	SGX Target	MAD2D
MPU IA	+	+	+	+	+	+	+	+	+	+	+	+
SGX IA					+	+	+					+
IVA2.2 IA	+	+	+	+	+	+	+		+	+		+
DSS IA					+		+					+
CAM IA					+		+					+
HS USB Host IA					+	+	+					+
HS USB OTG IA					+	+	+					+
sDMA RD IA	+	+	+	+	+	+	+			+	+	+
sDMA WR IA	+	+	+	+	+	+	+			+	+	+
DAP IA	+	+	+	+	+	+	+	+	+	+	+	+
SAD2D IA	+	+	+	+	+	+	+					

<sup>(1)</sup> A functional data path always exists from L4 IAs (Core, Per, Emu, and Wakeup) to any L4 target module (Core, Per, Emu, and Wakeup). As a consequence, all L3 initiator modules for which a data path exists to an L4 TA can access L4 peripherals. Restrictions on peripheral access depend on the security settings and L4 protection mechanism programming. For more details, see [Section 5.9.3, L4 Security and Firewalls](#).

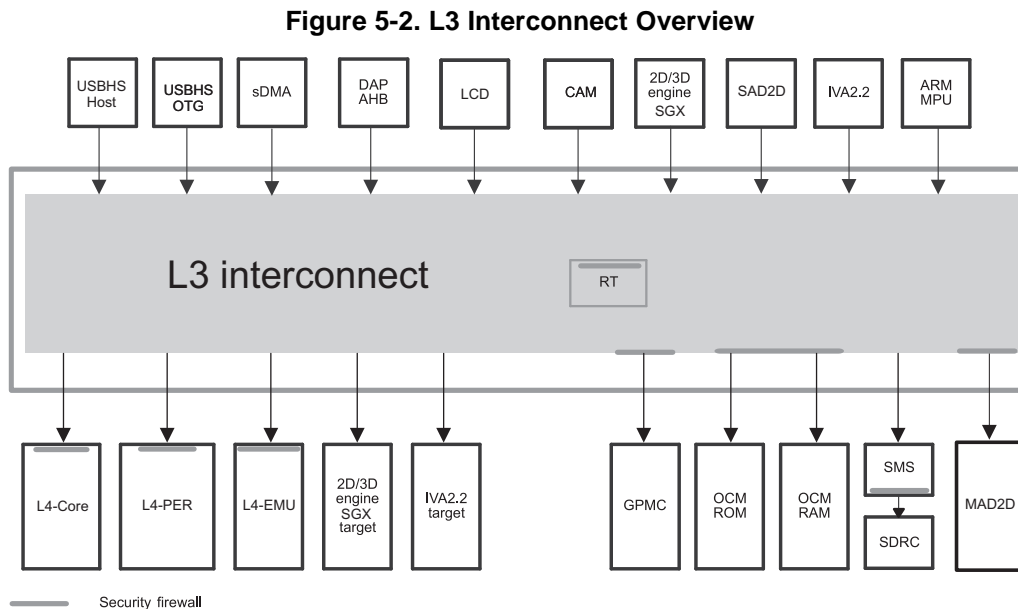

## 5.2 L3 Interconnect

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functionality for both the request and response network.

### 5.2.1 Overview

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

Figure 5-2 shows the L3 interconnect.

100-007

The following are the main features of the L3 interconnect:

- 64-bit multipath interconnect to eliminate on-chip bottlenecks
- Special internal target for access to L3 registers (RT)
- Guaranteed quality of service for real-time hardware operators, while maintaining optimal memory latency for MPU accesses to memory resources
- True little-endian platform
- Transaction error tracking and logging
- Built-in security features:
  - Allow access only to authorized initiator
  - Distributed region-based firewalls for system resource sharing and protection management
- Signaling support for chip-level power management infrastructure
- Two interrupt line signaling transaction error

## 5.3 L3 Interconnect Integration

### 5.3.1 Clocking, Reset, and Power-Management Scheme

#### 5.3.1.1 Clocks

The power, reset, and clock management (PRCM) module provides the L3\_ICLK as the main clock to the L3 interconnect.

In addition to L3\_ICLK, four additional sample signals are provided to module agents to allow internal synchronization. The modules are as follows:

- L4-Core
- L4-Per

For more details on the L3 clock and its setting, see the *Power, Reset, and Clock Management* chapter.

**Table 5-15. L3 Interconnect Clocks**

Type	Name	Source	Description
Interface/functional	L3_ICLK	PRCM	Main clock for L3 interconnect

#### 5.3.1.2 Resets

The L3 interconnect receives a single reset signal, CORE\_RST, from the PRCM module. CORE\_RST is the reset signal to the core power domain. (For more details, see the *Power, Reset, and Clock Management* chapter.) When asserted, CORE\_RST resets the L3 internal registers. There is no software reset for the L3 interconnect.

**Table 5-16. L3 Interconnect Reset**

Type	Reset Domain	Source	Description
Hardware	CORE_RST	PRCM	Asynchronous reset for the entire interconnect

#### 5.3.1.3 Power Domain

The L3 interconnect connects into the CORE power domain, which can dynamically switch among supported OPPs. For more details on power voltage scaling, see the *Power, Reset, and Clock Management* chapter.

**Table 5-17. L3 Interconnect Power Domain**

Interconnect	Power Domain
L3 interconnect	CORE

#### 5.3.1.4 Power Management

As part of the system-wide power-management scheme, the L3 interconnect enters an idle state at the request of the PRCM module. (For more details, see the *Power, Reset, and Clock Management* chapter.) The L3 interconnect is always in smart-idle mode; that is, it goes into idle state after receiving the request from the PRCM module once all transfer requests are serviced. This functionality is handled by hardware. The L3 interconnect sends an acknowledge signal back to the PRCM module when it enters the idle state.

## 5.3.2 Hardware Requests

### 5.3.2.1 Interrupt Requests

Three interrupt lines are present at the boundary of the L3 interconnect (see [Table 5-18](#)). They are used for hardware error management.

**Table 5-18. L3 Interconnect Hardware Requests**

Type	Name	Destination	Description
Interrupt	M_IRQ_9	MPU interrupt controller for debug errors	L3 interconnect provides a mechanism to group core-detected and internal interconnect errors. See <a href="#">Section 5.9.4, Error Handling</a> .
Interrupt	M_IRQ_10	MPU interrupt controller for application errors	
Interrupt	IVA2_IRQ [39]	IVA2.2 interrupt controller for application errors	

## 5.4 L3 Interconnect Functional Description

### 5.4.1 Initiator Identification

An InitiatorID is assigned to every thread on every initiator socket. The ID uniquely identifies the initiator and thread for an interconnect transfer see [Table 5-19](#). The interconnect uses InitiatorIDs for a number of purposes, including the following:

- Initiator source identification for the protection mechanism (see [Section 5.4.3, L3 Security and Firewalls](#))
- Response route generation (performed internally to the TAs)
- Firewall error logging
- L3 interconnect error logging

**Table 5-19. InitiatorID Definition**

Initiator	InitiatorID
HS USB Host	0
HS USB OTG	2
sDMA rd	3 , 4 , 5, 6
sDMA wr	7, 8
DAP	9
CAM	10, 11, 12
SGX	13
IVA2.2 SS DMA	14, 15, 16, 17, 18, 19
IVA2.2 SS	20, 21, 22
MPU SS	23, 24, 25, 26, 27
SAD2D	28
LCD	29

### 5.4.2 Register Target

An RT is a specialized TA used to access L3 interconnect internal configuration registers.

RT configuration options are a subset of those available for TAs. For more details, see [Section 5.6.5](#).

### 5.4.3 L3 Security and Firewalls

Security in the device relies heavily on L3 firewalls and their configuration. Nine targets are protected through the use of firewalls. The number of protected regions varies on the target, with a maximum of eight regions. [Table 5-20](#) lists the security configuration and the number of protected regions for each target.

**Table 5-20. Target Firewall and Region Configuration**

Target	Firewall	Number of Regions
SMS	Included in the SMS module	See the <i>Memory Subsystem</i> chapter.
GPMC	Yes	8
OCM-RAM	Yes	8
OCM-ROM	Yes	2
MAD2D	Yes	8
IVA2.2 target	Yes	4
L4-Core	Included in the L4 module	See <a href="#">Section 5.7</a> , L4 Interconnect.
L4-Wakeup	Included in the L4 module	See <a href="#">Section 5.7</a> , L4 Interconnect.
L4-Emu	Included in the L4 module	See <a href="#">Section 5.7</a> , L4 Interconnect.

**Table 5-20. Target Firewall and Region Configuration (continued)**

Target	Firewall	Number of Regions
RT	Yes	2

The protection mechanism designates protection regions within the address space of certain targets. Access to these regions is granted only for certain initiators, based on transaction attributes (transmitted through MReqInfo). Each protection region is characterized with several configurable attributes (base address, size, specific access rights, and priority setting).

The protection mechanism uses the following attributes of a request:

- The address field and the address space field are used to determine which region has been hit. The region ID selects one table entry of the firewall look-up table.
- The region ID points to a unique set of permission registers: Read\_Permission, Write\_Permission, ReqInfo\_Permission.
- The Initiator ID is used to determine the permission of the initiator (read/write permission) with respect to the concerned region.
- The access types (read or write) and the transaction attributes (MReqInfo in-band qualifiers) are used to grant or reject the access.

The first check determines whether the type of incoming request (read or write) is allowed, according to the Initiator MConnID and its read and write permissions. The second check determines whether the MReqInfo bits of the incoming request are within the allowed pattern established by the MReqInfo permission bits. If both check results are positive, the request is allowed to access the target. Otherwise, the access is denied, the request is not forwarded to the target, an out-of-band error indication is reported, and an in-band error response is returned to the initiator (except for writes that were posted at the IA). [Figure 5-3](#) shows the flow used to identify and accept a new request.

**Figure 5-3. Flowchart of the Protection Mechanism**

100-014

To summarize, firewalls accept or reject a request depending on the following:

- Initiator originating the request
- Command (read or write) requested
- MReqInfo bus state
- Region access in the target memory space

Software must configure the L3 firewalls properly to allow the right initiators, with the right MReqInfo access, on the well-defined size region. All the registers relative to the L3 firewalls are grouped in the protection mechanism (PM) register block.

---

**NOTE:** The PM qualifies the protection mechanism register associated with a firewall target. The targets protected by a firewall are listed in [Table 5-20](#). These PM registers do not exist if no firewall is associated with the target.

---

### 5.4.3.1 Protection Region

Two types of regions are distinguished in a target firewall (see [Figure 5-4](#)):

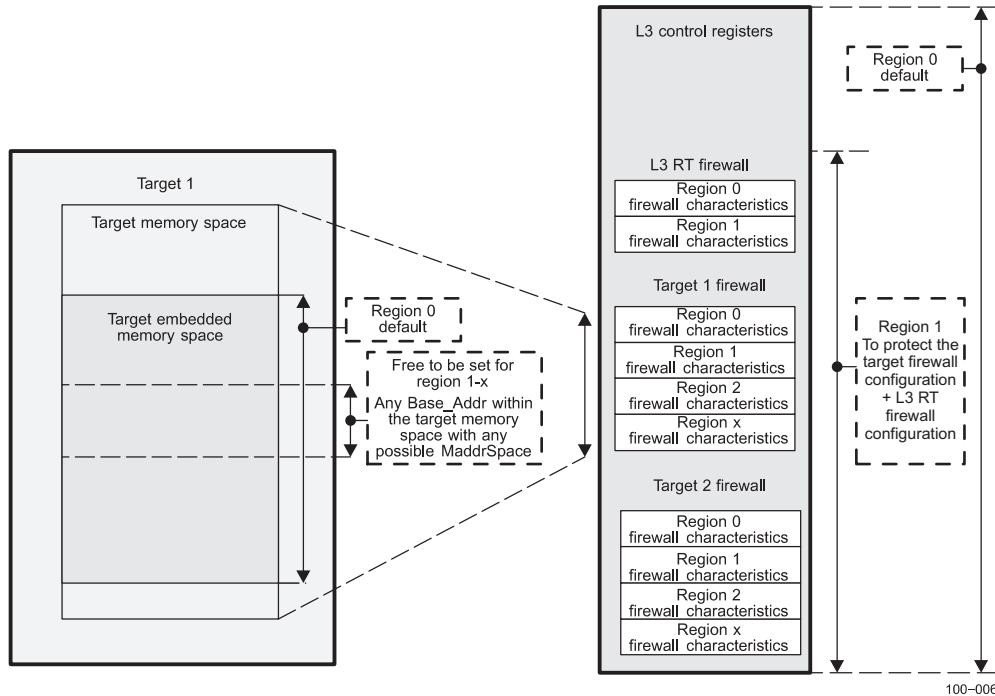

- Default region: Available in all targets; spans the entire target address range
- Normal region: Number varies in a target; they have identical capabilities

Each region has the following characteristics:

- A base address, relative to the target address itself, and an address space

- A size
- Specific access rights, as defined through the MReqInfo qualifiers
- A priority level, from 0 (lowest) to 3 (highest)

Figure 5-4. L3 Firewall Implementation

#### 5.4.3.1.1 Default Region/Region0

Region 0 is the default region of a whole target; it spans the entire target address space.

The default region is always the lowest priority. This region is systematically overlapped when other regions are set.

The L3\_PM\_ADDR\_MATCH\_k register is not accessible. Its configuration corresponds to all the possible addresses for the target, including all of ADDR\_SPACE. It is not possible to program multiple ADDR\_SPACE addresses in a normal region.

#### 5.4.3.1.2 Normal Regions

Normal regions have identical features.

A given request either maps into a specific protection region or is considered to have hit the default protection region if no normal region is hit.

The protection regions can only be configured for a memory space that is power-of-two in size and size-aligned using the SIZE bit field L3\_PM\_ADDR\_MATCH\_k [7:3] (as listed in Table 5-21). When the SIZE bit field L3\_PM\_ADDR\_MATCH\_k [7:3] is set to 0, the region is disabled.

**NOTE:** k denotes the region number. Depending on the target, n varies from 0 to 7.

Table 5-21 lists the size encoding for each value set in the SIZE bit field.

**Table 5-21. L3 Firewall Size Parameter Definition**

Possible Configuration		
Size <sup>(1)</sup>	Region Size	Base_Addr <sup>(2)</sup>
0x0	Region disabled	Any (nonsignificant)
0x1	1K-byte secure	0x0000000
		0x0000400
		0x0000800
0x2	2K-byte secure	0x0000000
		0x0000800
		0x0001000
...	...	...
0x17	2 <sup>^(17-1)</sup> K-byte secure	...
Others	Not allowed	-

<sup>(1)</sup> When the size parameter is set to 0, the region is disabled.

<sup>(2)</sup> The base address depends on user settings.

### 5.4.3.2 Priority Level Overview

Each L3 firewall region is prioritized. Depending on its priority level, a region can override the settings of another region.

- Region 0 is the only allowed priority 0 region (lowest priority).
- Region 1 is the only allowed priority 3 region (highest priority).
- Others regions are defined as priority 1 or 2.

#### CAUTION

LEVEL bitfield value of ADDR\_MATCH\_1 register (Region 1 firewall configuration) must be kept to his default reset value and must not be changed; otherwise, the result will be unpredictable and can create unexpected security holes or denial of service.

Protection level is defined by the LEVEL bit L3\_PM\_ADDR\_MATCH\_k , where n is greater than 2. [Figure 5-5](#) represents the priority level with associated regions.

When an address hits two or more regions with different priority levels, the highest priority region protections are applied. The overlay region can overlap all or a part of a nonoverlay region.

#### CAUTION

Configuring two overlapping protection regions with the same priority level leads to undefined behavior.

Hardware behavior in the case of overlapping protection regions is undefined. A region with higher priority must be used to mask a region that is being reprogrammed, and any security holes must be avoided during this reconfiguration.

To change the protection settings of a region, follow this procedure:

1. Ensure that a free region is available to be used as a high-priority region.

2. Program this region as a high-priority region so its parameters match the region to be changed. The final programming must be the L3\_PM\_ADDR\_MATCH\_k register, which includes the priority attribute and the size parameter to enable the region.
3. Disable the region to be configured or reconfigure it by setting the SIZE bit field to 0.
4. Set up all region control registers with the new configuration. The final programming must be the L3\_PM\_ADDR\_MATCH\_k register, which includes the size parameter to enable the region.
5. Disable the high-priority region by setting its size to 0.

This procedure must be used each time there is an overlap between the originally defined region and the newly defined region. The use of a high-priority region is required to keep security active during programming.

**Figure 5-5. L3 Region Overlay and Priority Level Overview**

100-008

### 5.4.3.3 Read and Write Permission

Read permission and write permission are configured using two registers:

- L3\_PM\_READ\_PERMISSION\_i
- L3\_PM\_WRITE\_PERMISSION\_i

The L3\_PM\_READ\_PERMISSION\_i and L3\_PM\_WRITE\_PERMISSION\_i registers allow the setting of read and write permission to one or more initiators. To grant read or write access, set the bit associated with the initiator to 1.

#### 5.4.3.4 REQ\_INFO\_PERMISSION Configuration

The firewall comparison mechanism enables access to a protected target only when a correct combination of four MReqInfo in-band parameters is transmitted.

MReqInfo is a combination of a fixed 4-bit pattern that corresponds to a combination of the parameters MReqSecure, MReqDebug, MReqType, and MReqSupervisor.

---

**NOTE:** In GP device MReqSecure = 1 (Secure value), is not supported.

---

Different valid MReqInfo combinations can be defined for each L3 firewall region based on the L3\_PM\_REQ\_INFO\_PERMISSION\_i value, which is programmed by software.

For each region, L3\_PM\_REQ\_INFO\_PERMISSION\_i lists the possible MReqInfo combinations. Setting a Reqbit in this register determines the type of access allowed to the initiator.

Table 5-22 lists the MReqInfo combinations available and the Reqbit associated with it.

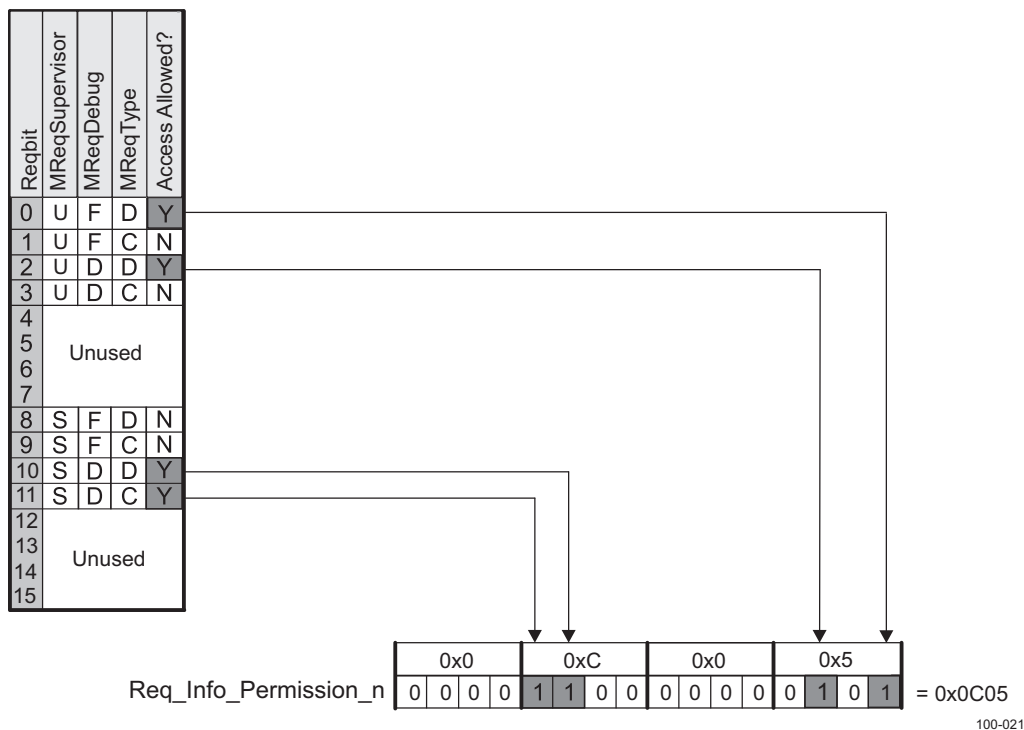

**Table 5-22. MReqInfo Parameter Combinations**

Reqbit	MReqInfo			
	MReqSupervisor	MReqSecure <sup>(1)</sup>	MReqDebug	MReqType
0	User	Public	Functional	Data
1	User	Public	Functional	Code
2	User	Public	Debug	Data
3	User	Public	Debug	Code
4	User	Secure <sup>(1)</sup>	Functional	Data
5	User	Secure <sup>(1)</sup>	Functional	Code
6	User	Secure <sup>(1)</sup>	Debug	Data
7	User	Secure <sup>(1)</sup>	Debug	Code
8	Supervisor	Public	Functional	Data
9	Supervisor	Public	Functional	Code
10	Supervisor	Public	Debug	Data
11	Supervisor	Public	Debug	Code
12	Supervisor	Secure <sup>(1)</sup>	Functional	Data
13	Supervisor	Secure <sup>(1)</sup>	Functional	Code
14	Supervisor	Secure <sup>(1)</sup>	Debug	Data
15	Supervisor	Secure <sup>(1)</sup>	Debug	Code

<sup>(1)</sup> In GP device MReqSecure = 1 (Secure value), is not supported.

Figure 5-6 shows an example of the L3\_PM\_REQ\_INFO\_PERMISSION\_i setting. In this example, L3\_PM\_REQ\_INFO\_PERMISSION\_i is set to 0x0C14 (16'b0000\_1100\_0001\_0100) for a specific region, which will grant access only if the request:

- User + Public + Debug + Data
- User + Secure + Functional + Data
- Supervisor + Public + Debug + Data
- Supervisor + Public + Debug + Code

**Figure 5-6. Example of REQ\_INFO\_PERMISSION Register**

As another example, to configure a target accessible only for data and in a public mode, Reqbit 0, 2, 8, and 10 must be set. Therefore, the L3\_PM\_REQ\_INFO\_PERMISSION\_i register must be set to 0x5050.

### 5.4.3.5 L3 Firewall Registers Overview

Table 5-23 lists the L3 firewall permission-setting registers. L3\_PM\_ADDR\_MATCH\_k, which is shown in this table, is not an accessible register.

**Table 5-23. L3 Firewall Permission-Setting Registers**

Register Name	Register Field Name	Field Modifiability	Parameter Comments	Region Comments
Region 0				
L3_PM_ADDR_MATCH_k (k=0)	ADDR_SPACE[2:0]	Hard coded	Corresponds to all the target memory space	This region is the default region. The default setting can be changed only with correct access according to L3 RT register.
	SIZE[7:3]	Hard coded	Corresponds to all the target memory space	
	Reserved		Default region: Level 0	
	BASE_ADDR[63:10]	Hard coded	Target-dependent	
L3_PM_REQ_INFO_PERMISSION_i (i=0)	REQ_INFO[15:0]	Yes	Type of access permitted. See Table 5-22.	
L3_PM_READ_PERMISSION_i (i=0)	READ_PERMISSION[15:0]	Yes	Initiator read permission, depending on connections. See Table 5-14.	
L3_PM_WRITE_PERMISSION_i (i=0)	WRITE_PERMISSION[15:0]	Yes	Initiator write permission, depending on connections. See Table 5-14.	

**Table 5-23. L3 Firewall Permission-Setting Registers (continued)**

Register Name	Register Field Name	Field Modifiability	Parameter Comments	Region Comments
Region 1-7				The default settings can be changed only with correct access based on the L3 RT register.
L3_PM_ADDR_MATCH_k	ADDR_SPACE[2:0]	Yes		
	SIZE [7:3]	Yes	The regions are power-of-two in size and size-aligned with Base_Addr reference. When Size = 0x0, the firewall is deactivated.	
	LEVEL[9]	Yes	Protection region level 0x0: Level 1 0x1: Level 2 Region 1 is always Level 3.	
	BASE_ADDR[63:10]	Yes	Target-dependent	
L3_PM_REQ_INFO_PERMISSION_i	REQ_INFO[15:0]	Yes	Type of access permitted. See <a href="#">Table 5-22</a> .	
L3_PM_READ_PERMISSION_i	READ_PERMISSION[15:0]	Yes	Initiators read permission, depending on connections. See <a href="#">Table 5-14</a> .	
L3_PM_WRITE_PERMISSION_i	WRITE_PERMISSION[15:0]	Yes	Initiators write permission, depending on connections. See <a href="#">Table 5-14</a> .	

### 5.4.3.6 L3 Firewall Error-Logging Registers

Table 5-24 lists the L3 firewall error-logging registers.

**Table 5-24. L3 Firewall Error Logging Registers**

Register Name	Register Field Name	Field Modifiability	Parameter Comments
L3_PM_ERROR_LOG	CMD[2:0]	Read only	Log the OCP command of the request that caused a protection violation. See <a href="#">Table 5-1</a> .
	REGION[6:4]	Read only	Log the region number targeted by the request that caused the protection violation.
	INITIATOR_ID[15:8]	Read only	Log the InitiatorID request that caused the protection violation. See <a href="#">Table 5-19</a>
	REQ_INFO[20:16]	Read only	Log the MReqInfo bits of the request that caused the protection violation. See <a href="#">Table 5-22</a> .
	CODE[27:24]	Read/write	Log the error that occurred. See <a href="#">Table 5-26</a> .
	MULT[31]	Read/write	If a second error is detected before the first is cleared, the MULT bit is set. Once set by hardware, the CODE and MULT bits can be cleared only by software or a full hardware reset. Software clears the CODE and MULT bits by writing a non-zero value to the CODE field and writing 1 to the MULT bit.

**NOTE:** This error log can be cleared in public mode by a read access. For more details, see [Section 5.5.3.2, Acknowledging Errors](#).

### 5.4.3.7 L3 Firewall and System Control Module

When a security violation occurs, an interrupt is sent to the MPU and IVA2.2 interrupt controller (if enabled). An in-band error is sent back, and an out-band error is logged in the CONTROL.CONTROL\_SEC\_ERR\_STATUS register. Two logging registers are used, depending on the functional mode:

- In application mode:
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [00]: OCM-ROM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [01]: OCM-RAM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [02]: GPMC security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [04]: SMS security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [05]: MAD2D security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [06]: IVA2.2 security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [07]: L4-Core security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [12]: L3 RT security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [15]: SAD2D security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [16]: L4-Per security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [17]: L4-Emu security violation
- In debug mode:
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [00]: OCM-ROM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [01]: OCM-RAM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [02]: GPMC security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [03]: SMS security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [05]: MAD2D security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [06]: IVA2.2 security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [12]: L3 RT security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [16]: L4-Per security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [17]: L4-Emu security violation

When a violation occurs, these bits are cleared when the L3 or L4 firewall embedded error log registers are cleared.

The L3 interconnect allows the inputting of the reset value of some of its internal registers from the system control module. This feature is used to configure the L3 firewalls in a secure state at start-up when required for the different targets. For more information on these registers, see the *System Control Module* chapter.

#### CAUTION

The exported reset value registers in the system control module can be accessed only when the MPU is in secure mode. They cannot be accessed on general-purpose devices. Outside secure mode, a read to this register returns 0.

## 5.4.4 Error Handling

### 5.4.4.1 Error Detection and Logging

The L3 interconnect provides mechanisms for the detection, logging, and distribution of module-detected and internal interconnect errors. Hardware support is provided to assist in logging errors and cleaning up the state to allow error recovery software to run.

Two types of errors are identified by the L3 interconnect:

- Errors detected by modules and passed along by the interconnect:
  - SResp error: Using the SResp in-band qualifier from the target, the initiator is informed that its request was unsuccessful (see [Table 5-3](#)). This error is nonspecific and further analysis is required to find its cause.
  - SError: This out-of-band qualifier reports that the target is denied service due to an internal cause. No further analysis can be done in the L3 itself.
- Errors detected by the L3 interconnect:
  - Unsupported command: This error reports that the initiator sent a command that cannot be processed, because the target cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
  - Address hole: This error reports an unknown address for a request. The address map is local to each IA; therefore, an address hole error is reported each time an initiator requests an access to a target it is not logically connected to, even if this address exists in the global L3 address map. This error is detected only once per burst.
  - Protection violation: This error indicates a request was rejected by a firewall.
  - Requests time-out: This error reports that the module did not end or respond to the request presented by the TA in the correct time interval. If the time interval for any request exceeds the time-out period, a time-out occurs. The target stops servicing requests.
  - Response time-out: This error reports that the module did not end the response presented by the IA in the correct time interval. If the time interval for any response exceeds the time-out period, a time-out occurs. The initiator stops servicing responses.
  - Burst open time-out: This error reports that a burst or ReadEx/Write pair is open and no command is presented to the module to end it. If the time interval for any command exceeds the time-out period, a time-out occurs. The initiator does not complete a burst or ReadEx/Write pair.

[Figure 5-7](#) shows a global view of the register link to the error reporting structure in an initiator and the target agents.

Figure 5-7. L3 Error Reporting Structure

100-023

Most errors are reported to the IA that originated the request, except for the following:

- Initiator time-outs are reported only out-of-band. Any time-out in the IA results in flagging it as unavailable. A software reset of the agent is required to accept any new requests from the attached core.

- Posted write request, because the IA immediately generates a valid response to the initiator core. This error is only in out-of-band.

Table 5-25 lists where the errors are detected and logged.

**Table 5-25. Error Types**

Error	Detection	Logging	In-band Report	Out-of-band Report
SResp error	None needed	At IA	Yes <sup>(1)</sup>	Yes
SError assertion from target	None needed	At TA	No	Yes
Unsupported command	At IA	At IA	Yes	Yes
Address hole	At IA	At IA	Yes	Yes
Protection violation	At TA	At protection mechanism agent	Yes <sup>(1)</sup>	Yes
Request time-out	At TA	At TA	Yes <sup>(1)</sup>	Yes
Response time out	At IA	At IA	No	Yes
Burst time-out	At IA	At IA	No	Yes

<sup>(1)</sup> In case of a posted write, errors cannot be reported in-band.

The time-out errors (request/response and burst) are persistent and require the software to reset both the module and the agent. No request can be processed in the agent until the reset is performed.

Other errors affect only the current request. Subsequent requests are treated normally. Errors are logged, however, and the information about the error used for debugging is kept until the software acknowledges the error.

Table 5-26 lists the information logged for each error code. Information logged in the two error-logging registers (L3\_IA\_ERROR\_LOG, L3\_IA\_ERROR\_LOG\_ADDR, L3\_TA\_ERROR\_LOG and L3\_TA\_ERROR\_LOG\_ADDR for each IA and TA) depends on the error itself. The CODE field ERROR\_LOG[27:24] identifies the type of error occurring for the IA and TA.

**Table 5-26. CODE Field Definition**

CODE[3:0]	Error Type	Type of Agent			Information Logged				
		IA	TA	PM	REQ_INFO	Secondary	InitiatorID	CMD	Address
0	No error	x	x						
1	Unsupported command	x			x	x	x	x	x
2	Address hole	x			x	x	x	x	x
3	Protection violation			x	x		x	x	
4	In-band error	x				x	x		
5	Not used								
6	Not used								
7	Request time-out not accepted		x		x		x	x	x
8	Request time-out, no response		x				x		
9-15	Not used								

#### 5.4.4.2 Time-Out

This section gives information about all modules and features in the high-tier device. See the *Device Family* chapter to check availability of modules and features. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

A time-out mechanism can be enabled in the target agent and initiator agent register. When the mechanism is enabled for a target agent or initiator agent and commands are not accepted or responses are not returned within the expected delay, the L3 interconnect generates an error event.

The error is logged in the target agent REQ\_TIMEOUT bit L3\_TA\_AGENT\_STATUS[8] for a target agent time-out, the BURST\_TIMEOUT bit L3\_IA\_AGENT\_STATUS[16] bit for an initiator burst time-out, and the RESP\_TIMEOUT bit L3\_IA\_AGENT\_STATUS[8] for an initiator response time-out. The affected agent enters an error state that causes it to send error responses to any new request. To recover from this state, the target agent must be reset by system software.

The time-out is counted starting from the moment a command is presented to the target, whatever the target response to this command is. The L3 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected target agents. These four signals are referred to as 1x time-base, 4x time-base, 16x time-base, and 64x time-base.

The time-base circuit offers four possible sets of four time-base signals selected by programming the TIMEOUT\_BASE field L3\_RT\_NETWORK\_CONTROL[10:8]. [Table 5-27](#) lists all of the values in the number of L3 clock cycles.

Each target agent can be programmed to refer to one of the four time-base signals. A time-out condition is detected when either the command acceptance or the response is not received after a delay of between one and three time-base periods. After the time-out is detected and logged, the behavior of the attached module is ignored. A new request to the module arriving at the timed-out target agent receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, the software is assumed to reset first the faulty module using its internal soft-reset bit, and then the agent using software reset.

**Table 5-27. L3 Timeout Register Target and Agent Programming**

REQ_TIMEOUT[2:0], BURST_TIMEOUT[2:0], and RESP_TIMEOUT[2:0]					
TIMEOUT_BASE[2:0]	0	1	2	3	4
0	All L3 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16384
3		1024	4096	16384	65536
4		4096	16384	65536	262144

#### 5.4.4.3 Error Steering

The error reporting structure consist of errors logged individually in the initiator or TAs. Some errors can be enabled and reported out-of-band by setting the following bits to 1:

- L3\_IA\_AGENT\_CONTROL.BURST\_TIMEOUT\_REP bit for burst time-out
- L3\_IA\_AGENT\_CONTROL.RESP\_TIMEOUT\_REP bit for response time-out
- L3\_TA\_AGENT\_CONTROL.REQ\_TIMEOUT\_REP bit for request time-out
- L3\_TA\_AGENT\_CONTROL.SERROR\_REP bit for request time-out

Setting the L3\_IA\_AGENT\_CONTROL.ALL\_INBAND\_ERROR\_REP bit causes all in-band errors returned to the IA to be reported out-of-band.

IAs connected to processors capable of generating the debug-flagged requests (the MPU and IVA2.2 subsystems) use error steering. Any error linked to an application (nondebug) request is qualified as primary; any error linked to a debug request is qualified as secondary. Setting the IA.INBAND\_ERROR\_PRIMARY\_REP or INBAND\_ERROR\_SECONDARY\_REP bit to 1 allows the reporting of in-band to out-of-band primary and secondary errors.

The level of the current error is indicated in SECONDARY bit L3\_IA\_ERROR\_LOG[30]. If an error occurs while another error is pending, the following occurs:

- If the pending error is primary, the new error is discarded at the IA level. MULTI bit L3\_IA\_ERROR\_LOG[31] is set in the initiator error log register to indicate that another error has been detected; no further information can be stored.

- If both the pending error and the new error are secondary, the latest error is discarded and MULTI bit L3\_IA\_ERROR\_LOG[31] is set.
- If the pending error is secondary and the incoming error is primary, MULTI bit L3\_IA\_ERROR\_LOG[31] is set and all useful information about the new error (MCmd, MAddr, MReqInfo, etc.) is stored. All information relative to the secondary error is discarded.

For protection violation, errors are detected at the TA and steered to the control module (see [Section 5.4.3.7, L3 Firewall and System Control Module](#)).

#### 5.4.4.4 Global Error Reporting

An out-of-band error refers to any flag output from the L3. It is not a formal error in the sense that it is not processed directly by the interconnect module; however, it is interpreted as such by one or several processors, typically by mapping it to an interrupt controller. All L3 out-of-band errors are ORed together and the result is transmitted to one or several interrupt controllers. All out-of-band errors are active high and must be acknowledged through a register access to be de-asserted.

Out-of-band errors are reported through error or flag signals, asynchronously to any other data flow, but synchronously to the clock.

All errors are reported out-of-band to the IVA2.2 and MPU subsystems simultaneously. The processors must check whether an error is relevant to the subsystems. These errors are routed not only to the IVA2.2 and MPU subsystem interrupt controllers, but also to their emulation logic (see [Figure 5-8](#)). Two composite flags help in asserting the error origin and criticality:

- The L3 application error flag reports application or nonattributable (not related to a request such as a time-out, SError) errors.
- The L3 debug error flag reports debug errors.

Figure 5-8. Global Error Routing

100-011

In addition to the SResp qualifier error reporting, some external targets use an SError signal to indicate that an internal error has occurred. Some resetting action may be required before any new request can be accepted, depending on the module and on the error itself. These signals are routed as flags internally to the L3. Table 5-28 lists the possible errors reported through an SError, propagated externally to the L3 interconnect, and aggregated to the L3 application error flag.

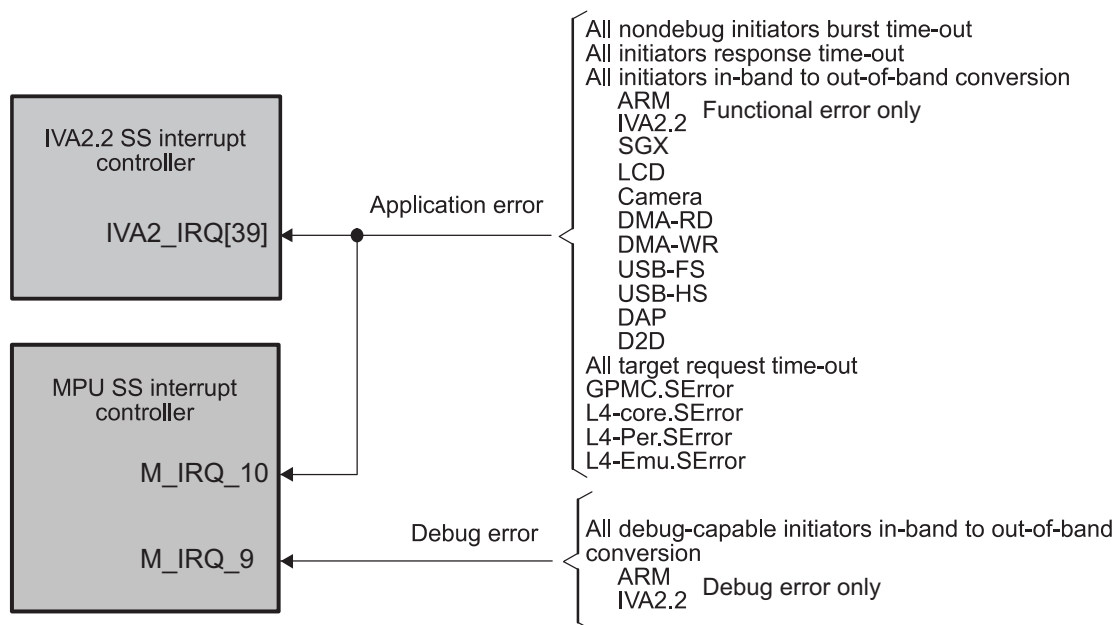

Table 5-28. L3 External Input Flags

Target	Flag	Description	Software Visible?
GPMC	SErrror	General-purpose error occurs in GPMC module	Yes, in FLAG_STATUS register and in L3 TA SERROR bit AGENT_STATUS[24]
L4-Core	SErrror	General-purpose error occurs on L4-Core	Yes, in FLAG_STATUS register and in L3 TA SERROR bit AGENT_STATUS[24]
L4-Emu	SErrror	General-purpose error occurs on L4-Emu	Yes, in FLAG_STATUS register and in L3 TA SERROR bit AGENT_STATUS[24]
L4-Per	SErrror	General-purpose error occurs on L4-Per	Yes, in FLAG_STATUS register and in L3 TA SERROR bit AGENT_STATUS[24]

**NOTE:** The user must ensure that the corresponding IRQ lines are set correctly in the interrupt controllers of the MPU and IVA2.2 subsystems.

Figure 5-9 shows the routing of errors to the application and debug error composite flags. Because both debug capable processors, the MPU and IVA2.2 subsystems have access to the full error report mechanism; they can be debugged independently of one another.

**Figure 5-9. L3 Error Routing**

100-005

Table 5-29 lists the bit and source for the STATUS bit field L3\_SI\_FLAG\_STATUS\_0[63:0] for an application error, and Table 5-30 lists the bit and source for the STATUS bit field L3\_SI\_FLAG\_STATUS\_1[63:0] for an application error for a debug error.

Protection errors are reported in-band to the IA when possible. This may not be possible for posted writes, however. These errors are also reported asynchronously to the module.

Additionally, all protection errors (even posted writes) are seen by the in-band-to-out-of-band conversion logic in the IAs. Therefore, all protection errors feed into the L3 application error and L3 debug error composite flags, and hence back to the MPU and IVA2.2 subsystems.

The SMS, L4-Core, L-4 Per, and L4-Emu interconnects have internal firewalls that use the same reporting scheme. These errors are not routed directly to the L3 interconnect but are reported in-band to the initiator, which routes them to the composite flags. The SMS, L4-Core, L4-Per, and L4-Emu interconnects always provide an error on the in-band SResp qualifier for protection violations.

**Table 5-29. L3\_SI\_FLAG\_STATUS\_0 for Application Error**

Flag Bit Number	Source		Flag Bit Number	Source	
	Agent	Error		Agent	Error
0	MPU IA	Burst time-out	32	Reserved

## 5.5 L3 Interconnect Basic Programming Model

### 5.5.1 General Recommendation

The L3 interconnect registers must be read or written with little-endian attributes; otherwise, the result is undefined.

#### **CAUTION**

Overlapping between protection regions with the same priority level leads to unpredictable behavior and must be avoided.

### 5.5.2 Initialization

At the release of power on reset, the L3 firewall default configuration enables all accesses to target modules, except for a section of the OCM ROM for which default Region 0 is configured to enable access for the MPU with the secure attribute only (this section corresponds to the secure boot ROM in the device memory mapping).

Therefore, the settings of Region 1 in the OCM ROM firewall allow access to 32K bytes of the OCM (this accessible 32K bytes corresponds to the public boot ROM in memory space mapping). For more details, see the *Memory Mapping* chapter.

Generally, software must configure the firewall properly to avoid poor use of the hardware resources.

L3 time-out capabilities are also disabled at reset.

### 5.5.3 Error Analysis

The information required to analyze an error source is logged in several registers (see [Table 5-26](#)). The number of registers to access depends on the error source. When investigating the origin of an error, software reads a set of error log registers. At each stage, the register either states the current error or points to the next agent in which the error is logged. [Figure 5-10](#) shows the software sequence required in most cases.

Figure 5-10. Typical Error Analysis Sequence

100-012

Errors that do not result from an in-band to out-of-band conversion can be extracted immediately from the application or debug error flag by reading the STATUS field L3\_SI\_FLAG\_STATUS\_0[63:0] and L3\_SI\_FLAG\_STATUS\_1[63:0] register; therefore, they do not require the whole analysis sequence shown in Table 5-26.

When analysis leads to a TA error, software must read the initiator agent ADDR field L3\_IA\_ERROR\_LOG\_ADDR[39:0] to extract the TA address causing the error.

### 5.5.3.1 Time-out Handling

This section gives information about all modules and features in the high-tier device. See the *Device Family* chapter to check availability of modules and features. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

### Example 1

In this example, the MPU interrupt handler detects an error from the L3 interconnect. A read access from the L3\_SI\_FLAG\_STATUS\_0 register reports a value of 0x40000. As described in [Table 5-29](#), the error detected is a burst time-out from the sDMA read port.

As with any time-out error, the affected module is now considered to be out-of-service. If necessary, the error can be cleared by sending a soft reset command to the agent (set CORE\_RESET bit L3\_IA\_AGENT\_CONTROL[0] to 1, and then to 0). During this time the initiator is off-line. Although the rest of the system still behaves normally, a time-out error is usually severe enough to require a complete reset of the chip.

Before resetting the agent or the system, the error log registers can learn the status of the interconnect and determine the type of failure. Reading the IA\_SDMA\_RD.L3\_IA\_AGENT\_STATUS register shows whether the time-out was detected during a burst or during a read/write sequence.

### Example 2

In this example, the MPU interrupt controller detects an error from the L3 interconnect. A read access from the L3\_SI\_FLAG\_STATUS\_0 register reports a value of 0x100. This is a functional error from the IVA2.2 subsystem initiator.

The IA\_IVA2.2.L3\_IA\_ERROR\_LOG register should be read next. The value stored in it is 0x12\_0400\_1302.

- CMD field IA\_IVA2.2.L3\_IA\_ERROR\_LOG[2:0]: Value 0x2. Not applicable for an in-band error.
- INITID field IA\_IVA2.2.L3\_IA\_ERROR\_LOG[15:8]: Value 0x13. The origin of the error is the IVA2.2 subsystem sDMA.
- CODE field IA\_IVA2.2.L3\_IA\_ERROR\_LOG[27:24]: Value 0x4. Error is an in-band error.
- SECONDARY bit IA\_IVA2.2.L3\_IA\_ERROR\_LOG[30]: Value 0x0. The error is functional.
- MULTI bit IA\_IVA2.2.L3\_IA\_ERROR\_LOG[31]: Value 0x0. No additional error has been detected.
- REQ\_INFO field IA\_IVA2.2.L3\_IA\_ERROR\_LOG[43:32]: Value 0x12. Not applicable for an in-band error.

There is no simple way to determine which target originated the in-band error. An SError assertion or a request time-out would have been detected and logged in the L3\_SI\_FLAG\_STATUS\_0 register. Because no such error is asserted (bits 60:48 are still 0), the error can only be a firewall error or have originated in the target itself. The user must read all of the PM\_xxx.L3\_PM\_ERROR\_LOG registers.

#### CAUTION

The PM register blocks are sensitive registers and are usually protected. Ensure that the processor used to debug the error is allowed to access these registers and has entered a correct security mode. If not, the access will be rejected and another error will be generated.

All PM\_xxx.L3\_PM\_ERROR\_LOG registers are clear (bits 27:24 equal 0x0) except for PM\_OCMRAM.L3\_PM\_ERROR\_LOG, which reads 0x0302\_1301. The error occurred while trying to access the OCM RAM.

---

**NOTE:** If all PM\_xxx.L3\_PM\_ERROR\_LOG registers are clear, the error is unrelated to the interconnect. Further analysis must be done in the targets.

---

- Bits 27:24: Value 0x3. There is a protection error.
- Bits 2:0: Value 0x1. The offending command was a posted write.
- Bits 6:4: Value 0x0. The address is protected by Region 0 (default region) of the firewall.
- Bits 15:8: Value 0x13. The origin of the error is the IVA2.2, thread 2. This is consistent with the error log on the initiator side, and confirms this error report is the correct one.
- Bits 20:16: Value 0x2. The security parameters were data, debug, public, and user.
- Bit 31: Value 0x0. This is the only error detected.

A check on the security configuration confirms that this access was not allowed, either because the initiator was not given write access or because the access security parameters were not compatible with the PM\_OCMRAM.REQINFO\_PERMISSIONS\_0 settings.

A security violation is not terminal from the interconnect point of view. If the modules responsible for the global chip security do not reset the system (including the IVA2.2 subsystem and the OCM RAM), it continues to run normally. A simple clearing of the error on both the IA and PM sides is required to return to a clean status.

### 5.5.3.2 Acknowledging Errors

Time-out errors can never be acknowledged. To return to a normal operation after an error, the faulty agent must be reset. An agent can be reset by asserting CORE\_RESET bit L3\_IA\_AGENT\_CONTROL[0] or L3\_TA\_AGENT\_CONTROL[0], or by resetting the L3 interconnect through the PRCM.

Functional errors, including an in-band signal reporting a protection error, must be inactivated through software. Setting the INBAND\_ERROR\_PRIMARY and INBAND\_ERROR\_SECONDARY bits L3\_IA\_AGENT\_STATUS[28-29] in an IA, or setting the SERROR bit L3\_IA\_AGENT\_STATUS[24] in a TA clears the reported error. [Table 5-31](#) lists the bit to clear and the associated type of error.

The L3\_IA\_ERROR\_LOG or L3\_TA\_ERROR\_LOG register must also be cleared by writing a nonzero value simultaneously to the CODE bit field and the values currently stored in the MULTI and SECONDARY fields.

**Table 5-31. Error Clearing**

Agent Type	Error	Register Field
Initiator	In-band primary (application) error	INBAND_ERROR_PRIMARY
	In-band secondary (debug) error	INBAND_ERROR_SECONDARY
Target	Target asserts SError	SERROR

The procedure to clear protection errors depends on the system security configuration:

- Write a nonzero value simultaneously into CODE bit field L3\_PM\_ERROR\_LOG[27:24] and the value currently stored in the MULTI bit L3\_PM\_ERROR\_LOG[31] of the corresponding PM register block.
- Alternately, read either L3\_PM\_ERROR\_CLEAR\_SINGLE or L3\_PM\_ERROR\_CLEAR\_MULTI, depending on the current value of the MULTI field in the L3\_PM\_ERROR\_LOG register. This solution, which allows the clearing of protection errors without having a write access on other protection registers, preserves security.

L3\_SI\_FLAG\_STATUS\_0 or L3\_SI\_FLAG\_STATUS\_1 must be checked at the end of any error acknowledging sequence to confirm that the acknowledgement was successful and that no other error is pending.

### 5.5.4 Typical Example of Firewall Programming Example

All four regions in the IVA2.2 target firewall can be configured with no restrictions. However, protection is required for a 14K-byte region starting at address 0x0 in address space 2, and it must accept any access from any initiator for the rest of the target. The protection restricts allowed accesses as follows:

- Only the IVA2.2 and the MPU can read from this memory.
- Only the MPU can write to this memory.
- The security parameters must include supervisor and functional.

Only accesses declared as supervisor and functional are allowed to pass through the protected region of the firewall. There is no restriction on type (data or code) or secure (public or secure) attributes.

[Table 5-32](#) lists the possible parameter combinations, whether they are allowed to pass or not, and why they are rejected.

**Table 5-32. MReqInfo Security Parameter Example**

Reqbit	MReq Supervisor	MReqSecure <sup>(1)</sup>	MReqDebug	MReqType	Access Allowed	Reason for Rejection
0	User	Public	Functional	Data	No	Not supervisor
1	User	Public	Functional	Code	No	Not supervisor
2	User	Public	Debug	Data	No	Not supervisor
3	User	Public	Debug	Code	No	Not supervisor
4	User	Secure <sup>(1)</sup>	Functional	Data	No	Not supervisor
5	User	Secure <sup>(1)</sup>	Functional	Code	No	Not supervisor
6	User	Secure <sup>(1)</sup>	Debug	Data	No	Not supervisor
7	User	Secure <sup>(1)</sup>	Debug	Code	No	Not supervisor
8	Supervisor	Public	Functional	Data	Yes	
9	Supervisor	Public	Functional	Code	Yes	
10	Supervisor	Public	Debug	Data	No	Not functional
11	Supervisor	Public	Debug	Code	No	Not functional
12	Supervisor	Secure <sup>(1)</sup>	Functional	Data	Yes	
13	Supervisor	Secure <sup>(1)</sup>	Functional	Code	Yes	
14	Supervisor	Secure <sup>(1)</sup>	Debug	Data	No	Not functional
15	Supervisor	Secure <sup>(1)</sup>	Debug	Code	No	Not functional

<sup>(1)</sup> In GP device MReqSecure = 1 (Secure value), is not supported.

Only combinations with codes 8, 9, 12, and 13 are allowed to access a target. REQ\_INFO field PM\_IVA2.2.L3\_PM\_REQ\_INFO\_PERMISSION\_i[15:0] for the protected region must be set to ((0x18) | (0x19) | (0x112) | (0x113)); that is, 0x3300.

### Solution 1

Set Region 0 to accept all accesses:

- PM\_IVA2.2.L3\_PM\_REQ\_INFO\_PERMISSION\_i (i=0)= 0xFFFF
- PM\_IVA2.2.L3\_PM\_READ\_PERMISSION\_i (i=0)= 0x140E
- PM\_IVA2.2.L3\_PM\_WRITE\_PERMISSION\_i (i=0)= 0x140E

Set Region 1 to cover the first 8K bytes of the protected region:

- PM\_IVA2.2.L3\_PM\_ADDR\_MATCH\_k (k=1) = 0x22 (start address 0x0, size 8K bytes, address space 2)
- PM\_IVA2.2.L3\_PM\_REQ\_INFO\_PERMISSION\_i (i=1) = 0x3300
- PM\_IVA2.2.L3\_PM\_READ\_PERMISSION\_i (i=1) = 0x0406 (IVA2.2 DMA and MMU and MPU are allowed)
- PM\_IVA2.2.L3\_PM\_WRITE\_PERMISSION\_i (i=1) = 0x0002 (only MPU is allowed to write)

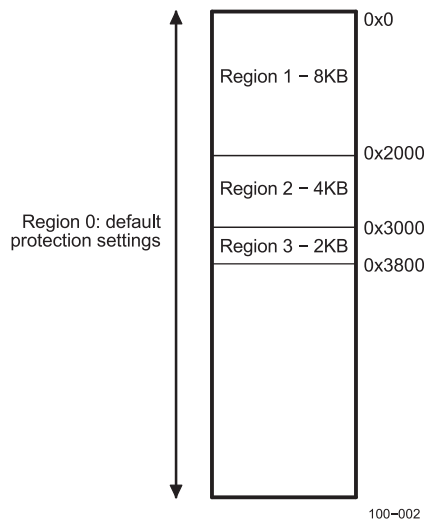

Set Region 2 to cover the next 4K bytes:

- PM\_IVA2.2.L3\_PM\_ADDR\_MATCH\_k (k=2) = 0x201A (start address 0x2000, level 1, size 4K bytes, address space 2)
- PM\_IVA2.2.L3\_PM\_REQ\_INFO\_PERMISSION\_i (i=2) = 0x3300
- PM\_IVA2.2.L3\_PM\_READ\_PERMISSION\_i (i=2) = 0x0406
- PM\_IVA2.2.L3\_PM\_WRITE\_PERMISSION\_i (i=2) = 0x0002

Set Region 3 to cover the last 2K bytes:

- PM\_IVA2.2.L3\_PM\_ADDR\_MATCH\_k (k=3)= 0x3012 (start address 0x3000, level 1, size 2K bytes, address space 2)
- PM\_IVA2.2.L3\_PM\_REQ\_INFO\_PERMISSION\_i (i=3) = 0x3300
- PM\_IVA2.2.L3\_PM\_READ\_PERMISSION\_i (i=3) = 0x0406
- PM\_IVA2.2.L3\_PM\_WRITE\_PERMISSION\_i (i=3) = 0x0002

Figure 5-11 shows the firewall configuration for Solution 1.

**Figure 5-11. Firewall Configuration Solution 1**

### Solution 2

Set Region 0 to accept all accesses:

- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=0) = 0xFFFF`
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=0) = 0x140E`
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=0) = 0x140E`

Set Region 2 to cover 16K bytes:

- `PM_IVA2.2.L3_PM_ADDR_MATCH_k (k=2) = 0x2A` (start address 0x0, level 1, size 16K bytes, address space 2)
- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=2) = 0x3300`
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=2) = 0x0406` (IVA2.2 DMA and MMU and MPU are allowed)
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=2) = 0x0002` (only MPU is allowed to write)

Set Region 1 to mask the last 2K bytes:

- `PM_IVA2.2.L3_PM_ADDR_MATCH_k (k=2) = 0x3812` (start address 0x3800, size 2K bytes, address space 2)
- `PM_IVA2.2.L3_PM_REQ_INFO_PERMISSION_i (i=1) = 0xFFFF`
- `PM_IVA2.2.L3_PM_READ_PERMISSION_i (i=1) = 0x042E`
- `PM_IVA2.2.L3_PM_WRITE_PERMISSION_i (i=1) = 0x042E`

### 5.6.1 L3 Initiator Agent (L3 IA) Register Mapping Summary

This section describes the IA register block. Each IA in L3 interconnect has its own IA register block.

The following are the IA registers:

- MPU subsystem port
- IVA2.2 subsystem port
- SGX subsystem port
- High-Speed USB Host
- High-Speed USB OTG
- System DMA read port
- System DMA write port
- Display subsystem port
- Camera subsystem port
- DAP port
- Die-to-die

Table 5-34 through Table 5-37 list the IA registers and their physical addresses, depending on the module instance.

**Table 5-34. Initiator Agent Common Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	IA_MPUS Physical Address	IA_IVA2.2 Physical Address	SGX Physical Address	Section

### 5.6.3 L3 Target Agent (L3 TA) Register Mapping Summary

This section describes the TA register block. Each TA in L3 interconnect has its own register block.

The following are the TA registers:

- SDRAM memory scheduler (TA\_SMS module)
- General-purpose memory controller (TA\_GPMC module)
- On-chip memory RAM (TA\_OCM\_RAM module)
- On-chip memory ROM (TA\_OCM\_ROM module)
- Master D2D (TA\_MAD2D module)
- IVA2.2 subsystem (TA\_IVA2.2 module)
- SGX subsystem (TA\_SGX module)
- L4-Core interconnect (TA\_L4\_CORE module)
- L4-Per interconnect (TA\_L4\_PER module)
- L4-Emu interconnect (TA\_L4\_EMU module)

Table 5-42 through Table 5-45 lists all initiator target registers and their physical addresses depending on the module instance.

Table 5-46 through Table 5-49 describe the individual common registers in the module instance.

**Table 5-42. Target Agent Common Register Mapping Summary**

Bits	Field Name	Description	Type	Reset
63:32	ID	Unique Interconnect ID	R	0x00000000
31:0	Reserved	Reserved	R	0x00000000

### 5.6.6.2 L3\_RT\_INITID\_READBACK

**Table 5-52. L3\_RT\_INITID\_READBACK**

<b>Address Offset</b>	0x070		
<b>Physical address</b>	0x6800 0070	<b>Instance</b>	RT
<b>Description</b>	This register is used by initiators to discover their own identity.		
<b>Type</b>	R		

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Reserved																															

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved												INITID																			

Bits	Field Name	Description	Type	Reset
63:8	Reserved	Reserved	R	0x0000000000000000
7:0	INITID	Returns initiator ID of core thread that initiated the read	R	0x18

**5.6.6.3 L3\_RT\_NETWORK\_CONTROL**
**Table 5-53. L3\_RT\_NETWORK\_CONTROL**

<b>Address Offset</b>	0x068	<b>Instance</b>	RT
<b>Physical address</b>	0x6800 0078		
<b>Description</b>	It controls such interconnect wide functions as the timeout base scale and the disabling of fine grained hardware clock gating.		
<b>Type</b>	RW		

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Reserved								CLOCK_GATE_DISABLE	Reserved																						

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																TIMEOUT_BASE	Reserved														

Bits	Field Name	Description	Type	Reset
63:57	Reserved	Reserved	R	0x00
56	CLOCK_GATE_DISABLE	Overrides fine grained hardware clock gating	RW	0
55:11	Reserved	Reserved	R	0x000000000000
10:8	TIMEOUT_BASE	Timeout base period in register target clock cycles Program the timeout base period. Each of the agent timeout features is programmed as a multiple of the timeout base period. These timeout bases are: 0x0: Timeout disabled 0x1: L3 interconnect clock cycles divided by 64 0x2: L3 interconnect clock cycles divided by 256 0x3: L3 interconnect clock cycles divided by 1024 0x4: L3 interconnect clock cycles divided by 4096	RW	0x0
7:0	Reserved	Reserved	R	0x00

### 5.6.7 Protection Mechanism (PM) Register Mapping Summary

This section describes the protection mechanism register block.

The following are the protection mechanism registers:

- Register target (PM\_RT module)
- General-purpose memory controller (PM\_GPMC module)
- On-chip RAM (PM\_OCM\_RAM module)
- On-chip ROM (PM\_OCM\_ROM module)
- IVA2.2 subsystem (PM\_IVA2.2 module)

Table 5-54 and Table 5-56 list the protection registers and their physical addresses, depending on the module instance.

Table 5-57 through Table 5-62 describe the individual common registers in the module instance.

**Table 5-54. Protection Mechanism Common Register Mapping Summary**

## 5.7 L4 Interconnects

### 5.7.1 Overview

To connect peripheral modules, the device uses four separate L4 interconnect structures. Although all L4 interconnects handle transfers with peripherals, the interconnects are in different power domains. The L4 interconnect is composed of the following:

- L4-Core: Includes the majority of the peripherals and the configuration interface for L3 interconnect system modules
- L4-Per: Includes peripherals that do not need to be mapped in the CORE power domain
- L4-Wakeup: Includes the peripherals attached to the WKUP power domain
- L4-Emu: Includes emulation peripherals attached to the EMU power domain

The following are the main features of the L4 interconnects:

- Single port to connect to L3 interconnect
  - L4-Core
  - L4-Per
- Dual ports for the following:
  - L4-Emu to connect to the L3 interconnect and DAP
  - L4-Wakeup to connect to the L4-Core and L4-Emu
- Single 32-bit initiator for the L3 port
- Multi target ports (one per target interface on the L4 interconnect)
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little-endian
- Non-blocking with fair arbitration between threads
- Target interfaces: Fully synchronous or divided synchronous
- Peak bandwidth of 2x M bytes/sec of L4 frequency (in MHz)
- Latency: Three cycles on request, one cycle on response
- Security logic provides user-configurable access control to targets by each initiator:
  - Firewall in L4-Core protects the core and wake-up peripherals.
  - Firewall in L4-Per protects per peripherals.
  - Firewall in L4-Emu protects emulation and wake-up peripherals

---

**NOTE:** L4-Wakeup has two input ports from L4-Core and L4-Emu. Therefore, wake-up peripherals appear in two locations in the memory mapping. Normally, L4-Emu limits its access except when debugging.

---

Figure 5-13 shows an overview of the L4 interconnects and the peripherals attached to them.

Figure 5-13. L4 Interconnect Overview

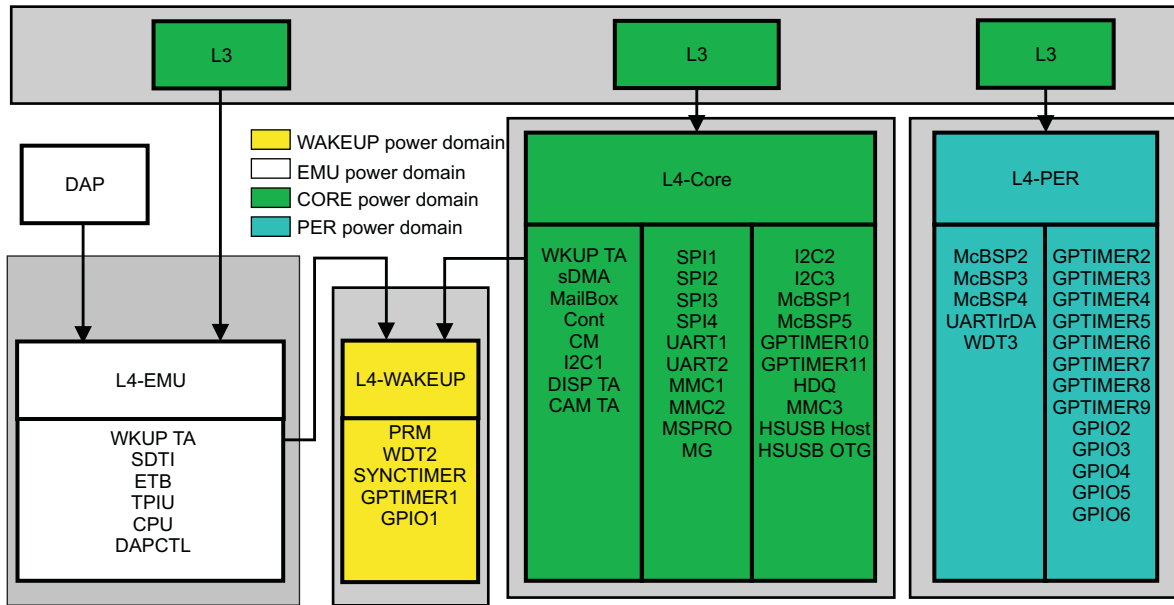

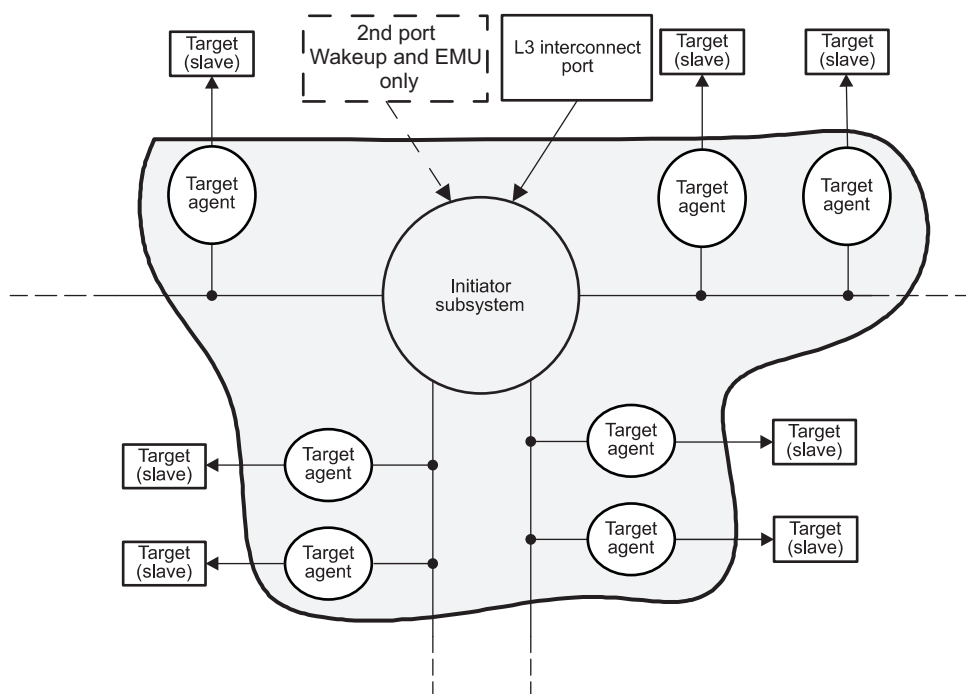

Figure 5-14 shows an internal view of the L4 interconnects in the overall interconnect. This architecture, with only one initiator module (the initiator subsystem) distributing transactions to all target modules (peripherals), enables the firewall functions of the L4 interconnects to be centralized at the L4 initiator level. The L4 firewall filters the accesses according to the configurable protection groups defined in the L4 address protection (AP) registers. Each module or agent is assigned to a protection group. Configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

**Figure 5-14. L4 Initiator-Target Connectivity for L4-Core and L4-Per**

100-010

**NOTE:** As Figure 5-14 shows, targets are attached to branches. These branches have no functional effect and are present for timing closure reasons only.

### 5.7.1.1 L4-Core Interconnect

The L4-core interconnect handles only transfers to peripherals in the CORE power domain. Table 5-72 lists the TAs.

**Table 5-72. L4-Core Target Agents**

Module Name	Description
Display subsystem	Display subsystem configuration port
Camera subsystem	Camera subsystem port
USBHS OTG	Universal serial bus High-Speed port OTG
USBHS Host	Universal serial bus High-Speed port Host
USBTLL	USB Transceiver Less Link
UART1	Universal asynchronous receiver transmitter port 1
UART2	Universal asynchronous receiver transmitter port 2
I2C1	Multimaster inter-integrated circuit 1
I2C2	Multimaster inter-integrated circuit 2
I2C3	Multimaster inter-integrated circuit 3
McBSP1	Multichannel buffered serial port 1
McBSP5	Multichannel buffered serial port 5
GPTIMER10	General-purpose timer 10
GPTIMER11	General-purpose timer 11
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2

**Table 5-72. L4-Core Target Agents (continued)**

Module Name	Description
MMCHS1	Multimedia memory controller SDIO 1
MMCHS2	Multimedia memory controller SDIO 2
MMCHS3	Multimedia memory controller SDIO 3
HDQ/1-Wire	Single wire serial link low rate
MS-PRO	Memory Stick PRO
MLB (mailbox)	Mailbox
RNG1	Random number generator 1
RNG2	Random number generator 2
D3D1	Data encryption standard 1
D3D2	Data encryption standard 2
SHA1MD5	Secure hash algorithm and message digest 5
SHA1MD5	Secure hash algorithm and message digest 5
AES	Advanced encryption
MG	MagicGate
FastPKA	Public key access
SPI1	Serial peripheral interface 1
SPI2	Serial peripheral interface 2
SPI3	Serial peripheral interface 3
SPI4	Serial peripheral interface 4
sDMA	System DMA controller
L4-Wakeup	L4-Wakeup interconnect
CM	Clock manager
SCM	System control module

**NOTE:** A unique port is used for communication between the L3 interconnect and the L4-Core interconnect to allow the L3 initiators to access the L4-Core targets.

For the list of initiators authorized to access the L4-Core peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.9.3.1, Protection Mechanism](#).

### 5.7.1.2 L4-Per Interconnect

The L4-Per interconnect handles only transfers to peripherals in the PER power domain. [Table 5-73](#) lists the TAs.

**Table 5-73. L4-Per Target Agents**

Module Name	Description
UARTIrDA	Universal asynchronous receiver/transmitter and infrared data association port
McBSP2	Multichannel buffered serial port 2
McBSP3	Multichannel buffered serial port 3
GPTIMER2	General-purpose timer 2
GPTIMER3	General-purpose timer 3
GPTIMER4	General-purpose timer 4
GPTIMER5	General-purpose timer 5
GPTIMER6	General-purpose timer 6
GPTIMER7	General-purpose timer 7
GPTIMER8	General-purpose timer 8

**Table 5-73. L4-Per Target Agents (continued)**

Module Name	Description
GPTIMER9	General-purpose timer 9
GPIO2	General-purpose I/O 2
GPIO3	General-purpose I/O 3
GPIO4	General-purpose I/O 4
GPIO5	General-purpose I/O 5
GPIO6	General-purpose I/O 6

**NOTE:** A unique port is used for communication between the L3 interconnect and the L4-Core interconnect to allow the L3 initiators to access the L4-Per targets.

For the list of initiators authorized to access the L4-Per peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.9.3.1, Protection Mechanism](#).

### 5.7.1.3 L4-Emu Interconnect

The L4-Emu interconnect handles only transfers to peripherals in the EMU power domain. [Table 5-74](#) lists the TAs.

**Table 5-74. L4-Emu Target Agents**

Module Name	Description
L4-Wakeup	L4-Wakeup interconnect
SDTI	System debug trace interface
ETB	Embedded trace buffer
TPIU	Trace port interface unit
MPU	ARM9
DAPCTL	Debug access port

Not all initiators can access all the targets in the L4-Emu interconnect. Additional restrictions affect the ability of these initiators to access the L4-Emu peripherals. [Table 5-75](#) lists which initiators can access the L4-Emu interconnect.

**NOTE:** For the list of initiators authorized to access the L4-Emu peripherals, see [Table 5-14](#). For details on restricted access, see [Section 5.9.3.1, Protection Mechanism](#).

**Table 5-75. L4-Emu Initiator Agents**

Module Name	Description
L3 interconnect	L3 interconnect port
DAP	DAP port

### 5.7.1.4 L4-Wakeup Interconnect

The L4-Wakeup interconnect handles only transfers to peripherals in the WKUP power domain. [Table 5-76](#) lists the TAs.

**Table 5-76. L4-Wakeup Target Agents**

Module Name	Description
PRM	Power reset manager
GPIO1	General-purpose I/O 1

**Table 5-76. L4-Wakeup Target Agents (continued)**

Module Name	Description
GPTIMER1	General-purpose timer 1
GPTIMER12 <sup>(1)</sup>	General-purpose timer 12
WDTIMER1 <sup>(1)</sup>	Secure watchdog timer
WDTIMER2	MPU subsystem watchdog timer
32KTIMER	32-kHz timer
USIM	Universal Identity Subscriber Module

<sup>(1)</sup> Not available in GP device.

Initiators that can access the L4-Core or L4-Emu can access all the targets in the L4-Wakeup interconnect. [Table 5-77](#) lists the initiators that can access the L4-Wakeup interconnect. For details on restricted access, see [Section 5.9.3.1, Protection Mechanism](#).

**Table 5-77. L4-Wakeup Initiator Agents**

Module Name	Description
L4-Core interconnect	L4-Core interconnect port
L4-Emu interconnect	L4-Emu interconnect port

## 5.8 L4 Interconnects Integration

### 5.8.1 Clocking, Reset, and Power-Management Scheme

#### 5.8.1.1 Clocks

Four functional clocks are used in each L4 interconnect (see [Table 5-78](#)).

**Table 5-78. L4 Interconnect Clocks**

Clock	Frequency	Name	Comments
L4-Core interconnect clock	Up to Core_L3_ICLK/2	CORE_L4_GICLK	Source, control, and gating handled by PRCM module
L4-Per interconnect clock	Up to Core_L3_ICLK/2	PER_L4_GICLK	Source, control, and gating handled by PRCM module
L4-Emu clock		L4_EMU	Clock for emulation
L4-Wakeup interconnect clock		WKUP_L4_GICLK	Source, control, and gating handled by PRCM module

#### 5.8.1.2 Resets

##### 5.8.1.2.1 Hardware Reset

L4 interconnects receive a reset signal from the PRCM module, which is the reset signal to the CORE power domain. For more details, see the *Power, Reset, and Clock Management* chapter.

[Table 5-79](#) lists the hardware reset for the L4-Core interconnect.

**Table 5-79. L4 Interconnect Hardware Reset**

Interconnect	Reset Domain
L4-Core interconnect	CORE_RST
L4-Per interconnect	PER_RST
L4-Wakeup interconnect	WKUP_RST
L4-Emu interconnect	EMU_RST

##### 5.8.1.2.2 Software Reset

The L4 interconnects have hardware reset capabilities, but do not have software reset capabilities. The hardware reset capabilities are controlled by the PRCM module and are applied to the L4 interconnects and the connected L4 TAs and L4 target modules.

#### 5.8.1.3 Power Domain

For more details on power voltage scaling, see the *Power, Reset, and Clock Management* chapter.

[Table 5-80](#) lists the power domains for the L4-Core and L4-Wakeup interconnects.

**Table 5-80. L4 Interconnect Power Domains**

Interconnect	Power Domain
L4-Core interconnect	CORE
L4-Per interconnect	PER
L4-Emu interconnect	EMU
L4-Wakeup interconnect	WKUP

#### 5.8.1.4 Power Management

##### 5.8.1.4.1 Module Power-Saving

The L4 interconnect automatically performs internal clock autogating to reduce power consumption. Though not recommended, it is possible to deactivate clock autogating by writing 1 to the `CLOCK_GATE_DISABLE` bit `L4_LA_NETWORK_CONTROL_H[24]` of each L4 interconnect. Clock autogating is enabled by default.

##### 5.8.1.4.2 System Power Management and Wakeup

As part of the system-wide power-management scheme, the L4 interconnect enters an idle state at the request of the PRCM module (for more information, see the *Power, Reset, and Clock Management* chapter). The L4 interconnect is always in smart-idle mode; that is, it goes into idle state after receiving the request from the PRCM module once all the transfer requests are complete. This functionality is handled by hardware. The L4 interconnect sends an acknowledge signal back to the PRCM module when it enters idle state.

## 5.9 L4 Interconnects Functional Description

### 5.9.1 L4-Interconnects Initiator Identification

In the device interconnect, a ConnID is an initiator module identifier. The L4 interconnect uses the same ConnID as L3.

### 5.9.2 Endianness Management

Both L4 interconnects are little-endian only. Any initiator accessing the L4 interconnect module must consider byte ordering and perform a conversion, if necessary.

### 5.9.3 L4 Security and Firewalls

#### 5.9.3.1 Protection Mechanism

The following two parameters are used to set up access permission because of the large address spaces and the number of peripherals connected to the L4 interconnects:

- Programmable groups for initiators:
  - 8 protection groups for the L4-Core interconnect
  - 8 protection groups for the L4-Per interconnect
  - 6 protection groups for the L4-Emu interconnect
- Each segment is divided into regions of 2K bytes:
  - 100 regions for the L4-Core interconnect
  - 43 regions for the L4-Per interconnect
  - 26 regions for the L4-Emu interconnect

---

**NOTE:** Regions and segments are present for the L4-Wakeup interconnect but cannot be programmed. The L4-Wakeup protection is done through the L4-Core and L4-Emu interconnects.

---

A protection group is a group of targets that have the same security settings. Initiator access is defined by CONNID\_BIT\_VECTOR field L4\_AP\_PROT\_GROUP\_k\_L[15:0]. The initiators have the same access permission to all regions in this group.

A region is programmed to allow access to a unique selectable protection group by using PROT\_GROUP\_ID field L4\_AP\_REGION\_l\_H[22:20].

---

**NOTE:** k denotes the protection group number.

l denotes the region number.

---

#### 5.9.3.2 Protection Group

A protection group defines which initiators with a given MReqInfo can access the targets agent protected by this group.

The CONNID\_BIT\_VECTOR field L4\_AP\_PROT\_GROUP\_MEMBERS\_k[15:0] (see [Figure 5-15](#)) is a 1-bit vector that sets up initiator permission access regions. A protection group is accessible by an initiator if the bit position corresponding to its ConnID is set to one in the CONNID\_BIT\_VECTOR field.

The ENABLE field L4\_AP\_PROT\_GROUP\_ROLES\_k[31:0] lists all possible MReqInfo combinations. Setting a Req bit in this register determines the type of access allowed to the initiator. See [Section 5.4.3.4, REQ\\_INFO\\_PERMISSION Configuration](#), for more information. MReqInfo is used in L4 the same way it is used in the L3 firewall configuration.

**NOTE:** Permissions are identical for read and write accesses in L4 interconnect targets.

Figure 5-15 shows an example of CONNID\_BIT\_VECTOR.

**Figure 5-15. Example of CONNID\_BIT\_VECTOR**

Setting bits 1 and 4 in the PROT\_GROUP\_ID\_1 defines a group initiator able to access targets in protection group 1, and includes:

- MPU SS
- IVA2.2 MMU

Protection group 1 (PG1) can be applied to multiple protection regions without limitation. Each protection region I that is configured with PG1 enables permission access to these two initiators only.

The firewall default configuration for the L4-Core interconnect contains eight protection groups to ensure security:

- Most regions are, by default, set with protection group 7 (PG7), which is configured for all access (see Table 5-81).
- Protection group 0 (PG0) is restricted to the MPU subsystem in public.
- By default, the hardware crypto-processors (DES, SHA1-MD5, AES, FPKA, RNG, and WDTIMER1 not available in GP device) are attached to PG1 and are publicly accessible by all the initiators that can access the L4-Core.
- The LCD is attached to protection group 2 (PG2).
- The Camera is attached to protection group 3 (PG3).
- The GPTIMER12 of the L4-Wakeup interconnect is attached to protection group 4 (PG4) (not available in GP device).
- By default, PG5 to PG7 are configured for all access.

**NOTE:** System control module and secure watchdog timer have an embedded firewall.

The L4-Per interconnect contains eight protection groups:

- By default, PG0 to PG7 are configured for all access.
- By default, most regions are set with PG7, which is configured for all access (see Table 5-82).

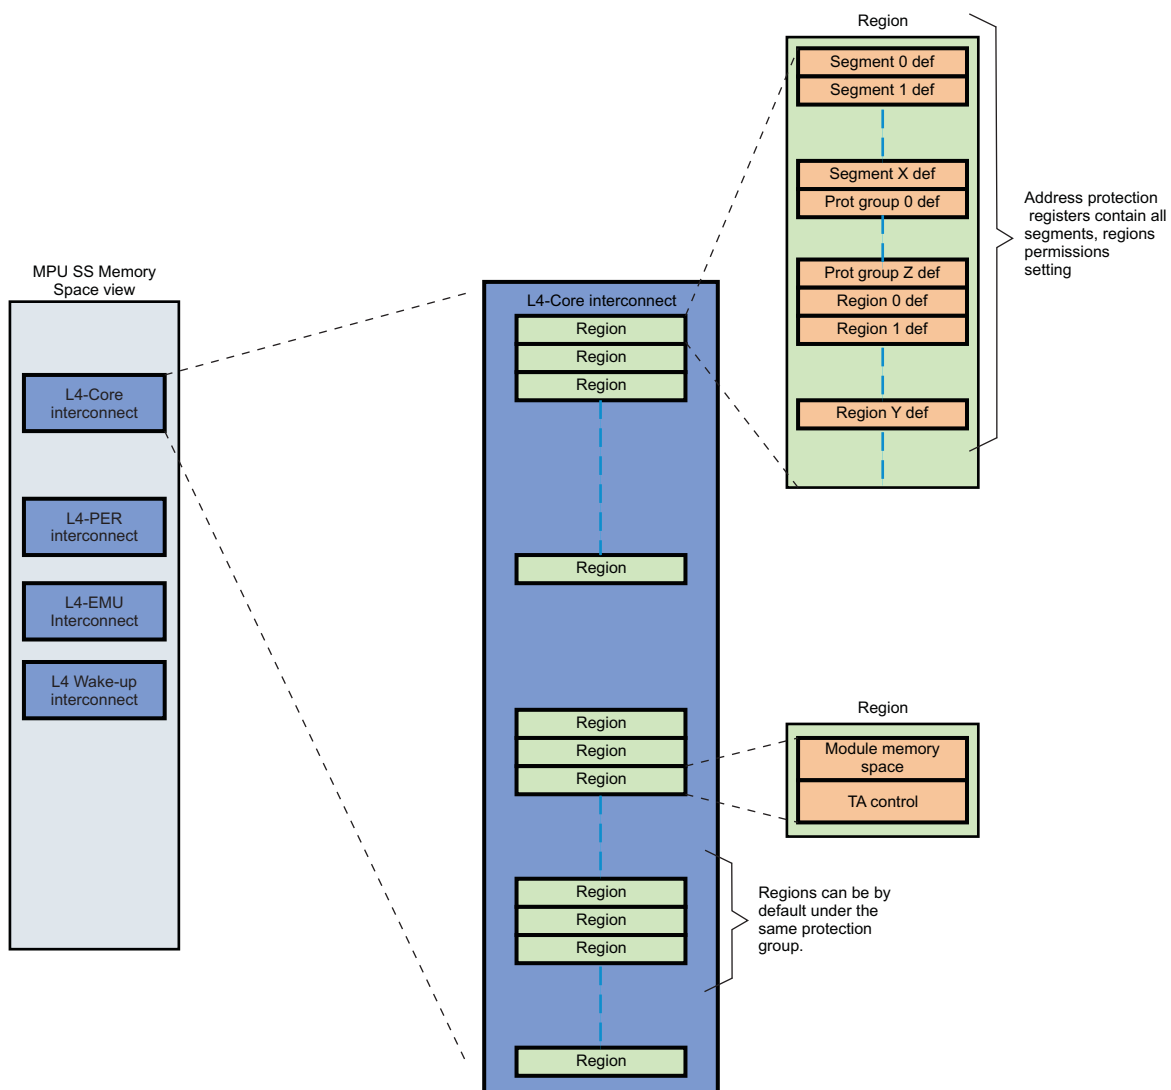

The L4-Emu interconnect contains six protection groups:

- By default, most regions are set with PG5, which is configured for all access (see [Table 5-83](#)).
- The AP is attached to PG0.
- The WDTIMER1 is attached to PG1 (not available in GP device).
- The GPTIMER12 is attached to PG2 (not available in GP device).
- The emulation organs are attached to PG3.

### 5.9.3.3 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation (see [Figure 5-16](#)). By default, some regions are attached to a specific protection group. This specificity allows the user to set up the permission access for certain types of modules that require the same access protection without managing the region allocation.

**Figure 5-16. L4 Firewall Overview**

100-018

All interconnect address spaces are covered by regions. [Table 5-81](#) to [Table 5-83](#) list the module mapping, including the address, region number, and default protection group allocated to it.

By setting ENABLE bit L4\_AP\_REGION\_y\_H[0] to 0, the region becomes inactive and therefore inaccessible. Setting the bit to 1 activates the region.

**Table 5-81. Region Allocation for L4-Core Interconnect**

Device Name	Start Address (hex)	Description	Region Number	Default Protection Group

### 5.9.3.4 L4 Firewall Address and Protection Registers Setting

[Table 5-84](#) lists the settings of the AP registers for an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

**Table 5-84. L4 Firewall Register Description Overview**

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_I_L	23:0	Base	Segment base address
	L4_AP_SEGMENT_I_H	4:0	SIZE	Segment size equals to 2 power of SIZE
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L	15:0	CONNID_BIT_VECTOR	See <a href="#">Section 5.9.1</a> for L4ConnID).
	L4_AP_PROT_GROUP_ROLES_k_L	15:0	ENABLE	Refer to <a href="#">Table 5-22</a> for MReq description
Region setting	L4_AP_REGION_I_L	23:0	BASE	Define the base address of region in respect to its respective segment base address
	L4_AP_REGION_I_H	27:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	The protection group attached to the region
		19:17	BYTE_DATA_WIDTH_EXP	Determine the number of bytes in an access
		5:1	SIZE	Size of the region equals to 2 power of SIZE
	0	ENABLE	Enable the region protection	

## 5.9.4 Error Handling

### 5.9.4.1 Overview

The L4 interconnect provides mechanisms for handling either internally detected errors or errors reported by modules attached to the L4 target ports. Hardware support facilitates logging errors and cleaning up the state to allow error recovery software to treat the error.

As an L3 target, the L4 interconnect reports errors to the L3 interconnect in-band whenever possible. In-band error reporting is the default and recommended configuration. It is assumed that INBAND\_ERROR\_REP bit L4\_IA\_AGENT\_CONTROL\_L[27] is set to 1.

---

**NOTE:** *L4\_IA* denotes which interconnect is considered: L4-Core, L4-Per, L4-Emu, or L4-Wakeup.

*L4\_TA* denotes the module name, such as UART1, McBSP1, etc.

---

The L4 interconnects handle three types of errors:

- No target core found or address hole
- Request protection violation
- Failure of the target to service a request before a time-out expires

### 5.9.4.2 Error Logging

#### 5.9.4.2.1 No Target Core Found/Address Hole

This error indicates that a request was addressed to a hole in the L4 address map.

When this occurs, an in-band error response is returned to the L3 level.

The error is also logged into the INBAND\_ERROR bit L4\_IA\_AGENT\_STATUS\_L[27].

Additionally, an address hole error code is logged into the CODE field L4\_IA\_ERROR\_LOG\_L[25:24].

The L4\_IA\_ERROR\_LOG register also includes MULTI bit L4\_IA\_ERROR\_LOG\_L[31], which is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

#### 5.9.4.2.2 Protection Violation

This error indicates that an initiator has accessed a restricted region. This error is reported using an in-band error. It is written to the INBAND\_ERROR field. A protection violation error code is also saved in the CODE field L4\_IA\_ERROR\_LOG\_L[25:24].

The security violation is also logged in the CONTROL\_SEC\_ERR\_STATUS [7] register of the system control module.

---

**NOTE:** There is no specific error signal for the security violation that goes out from the L4 interconnects. The out-band error that goes to the system control module indicates a SECURITY\_VIOLATION, but it also indicates normal interconnect errors.

---

#### 5.9.4.2.3 Time-Out

This section gives information about all modules and features in the high-tier device. See the *Device Family* chapter to check availability of modules and features. To flag interconnect response being blocked, the time-out of target agents attached to unavailable modules can be enabled with the lowest setting.

A time-out mechanism can be enabled on a per-target basis in the L4\_TA\_AGENT\_CONTROL\_L register. If the mechanism is enabled for a TA, and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

The error is logged in the target agent REQ\_TIMEOUT bit L4\_TA\_AGENT\_STATUS\_L[8]. The affected TA enters an error state that causes it to send error responses to any new request targeted at it. To recover from this state, the TA must be reset by system software. The time-out is counted starting from the moment a command is presented to the target, regardless of how the target responds to the command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. These four signals are referred to as 1X-time base, 4X-time base, 16X-time base, and 64X-time base.

The time-base circuit offers four possible sets of time-base signals. Selection is done by programming TIMEOUT\_BASE field L4\_LA\_NETWORK\_CONTROL\_L[10:8]. [Table 5-85](#) lists the values in the number of L4 clock cycles.

**Table 5-85. L4 Time-Out Link and TA Programming**

TIMEOUT_BASE[2:0]	REQ_TIMEOUT[2:0]				
	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16384
3		1024	4096	16384	65536
4		4096	16384	65536	262144

The reset value is 0x4, resulting in the longest possible time-out.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, by using REQ\_TIMEOUT field L4\_TA\_AGENT\_CONTROL\_L[10:8] (see [Table 5-86](#)).

**Table 5-86. L4 Time-Out TA Programming**

REQ_TIMEOUT	Target Agent Time-out Reference
0	Time-out locally disabled
1	1X-base cycle
2	4X-base cycle
3	16X-base cycle
4	64X-base cycle

A time-out condition is detected when the command acceptance or the response is not received after a delay of between one and three time-base periods.

Example:

- L4 frequency = 100 MHz
- TIMEOUT\_BASE = 4 in the L4\_LA\_NETWORK\_CONTROL\_L register
- REQ\_TIMEOUT = 2 in the L4\_TA\_AGENT\_CONTROL\_L for target agent A
- REQ\_TIMEOUT = 4 in the L4\_TA\_AGENT\_CONTROL\_L for target agent B

At agent A, the time-base unit is 16384 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 164  $\mu$ s to 492  $\mu$ s.

At agent B, the time-base unit is 262,144 cycles. A time-out is issued when a request to the attached module is not accepted or no response is sent after a delay of 2.6 ms to 7.8 ms.

On detection of a time-out condition, the agent automatically generates an error response to the inter\_IA, which is forwarded to the L3. The agent also logs the time-out to REQ\_TIMEOUT bit L4\_TA\_AGENT\_STATUS\_L[8].

After the time-out has been detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

To recover from a time-out error, the software is assumed to reset first the faulty module by using its internal soft reset bit, and then the TA by using OCP\_RESET bit L4\_TA\_AGENT\_CONTROL\_L[0].

### 5.9.4.3 TA Software Reset

Writing 1 to OCP\_RESET bit L4\_TA\_AGENT\_CONTROL\_L[0] initiates the software reset period. The software reset must be asserted for at least 16 cycles of the target module OCP clock, which can be a divided clock with respect to the L4 clock.

During the software reset period the following occur:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to avoid getting unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The L4\_TA\_AGENT\_STATUS\_L[8] REQ\_TIMEOUT status bit is cleared.

Writing 0 to the L4\_TA\_AGENT\_CONTROL\_L[0] OCP\_RESET bit terminates the software reset period.

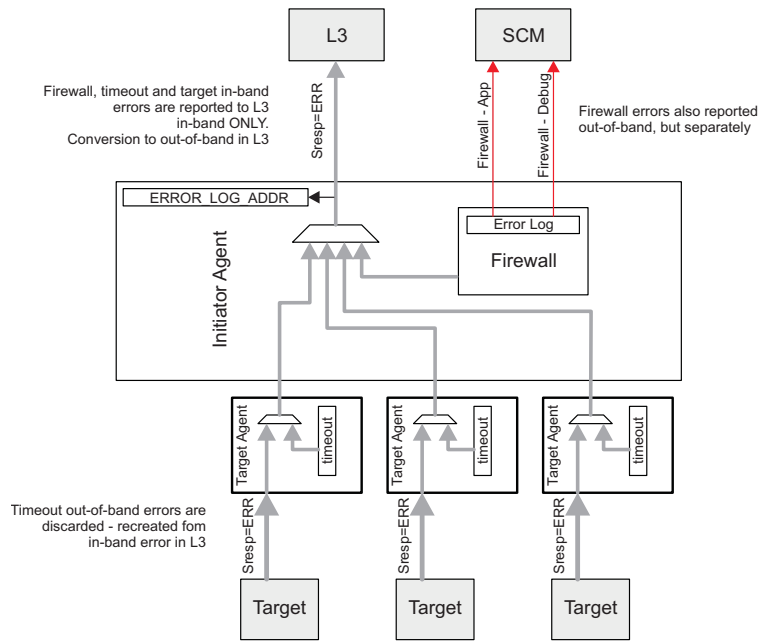

The attached module must then be reset to complete the recovery.

### 5.9.4.4 Error Reporting

Figure 5-17 illustrates the error-reporting scheme used in the L4\_Core, L4\_Per, and L4\_EMU interconnects.

- Timeout error generation is enabled at each TA.
- Timeout error and target in-band errors are only reported in-band to the L3 initiator.
- Protection violations are reported out-of-band. Error steering is used to distinguish between application or debug errors.

Figure 5-17. L4 Error Reporting

### 5.10.1 L4 Initiator Agent (L4 IA) Register Mapping Summary

This section provides information on the L4 IA module. Each of the registers within the module instance is described separately in [Table 5-91](#) to [Table 5-92](#).

The initiator OCP interface register block (IA) consists of the status, control, and error log registers that can be used to configure the interface of an initiator OCP. There can be only one register block for each initiator OCP interface.

**Table 5-91. L4 IA Register Mapping Summary (1)**

Register Name	Type	Register Width (Bits)	CORE_IA Physical Address	PER_IA Physical Address	EMU_IA_L3 Physical Address	Section

## 5.10.2 L4 Initiator Agent (L4 IA) Register Descriptions

### 5.10.2.1 L4\_IA\_AGENT\_CONTROL\_L

**Table 5-93. L4\_IA\_AGENT\_CONTROL\_L**

<b>Address Offset</b>	0x020
<b>Physical address</b>	Please refer from <a href="#">Table 5-91</a> to <a href="#">Table 5-92</a>
<b>Description</b>	Enable error reporting on an initiator interface. The error reporting mechanism is enabled when the INBAND_ERROR_REP bit field is set to 1. The out-of-band OCP MError reporting mechanism is enabled when the MERROR_REP bit field is set to 1.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				INBAND_ERROR_REP	Reserved		MERROR_REP	Reserved																							

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0.	R	0x0
27	INBAND_ERROR_REP	Setting this field to 1 reports on in-band errors using the INBAND_ERROR log bit of IA.AGENT_STATUS register.	R	1
26:25	Reserved	Read returns 0.	R	0x0
24	MERROR_REP	Enable MError reporting	R	0x0
23:0	Reserved	Read returns 0.	R	0x0000000

### 5.10.2.2 L4\_IA\_AGENT\_STATUS\_L

**Table 5-94. L4\_IA\_AGENT\_STATUS\_L**

<b>Address Offset</b>	0x028
<b>Physical address</b>	Please refer from <a href="#">Table 5-91</a> to <a href="#">Table 5-92</a>
<b>Description</b>	Stores status information for an initiator. The INBAND_ERROR and MERROR fields are read/write and are implemented as log bits.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				INBAND_ERROR_REP	Reserved		MERROR_REP	Reserved																							

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0.	R	0x0
27	INBAND_ERROR_REP	0x0 No In-Band error present. 0x1 In-Band error present.	R 1toClr	0x0
26:25	Reserved	Read returns 0.	R	0x0
24	MERROR_REP	0x0 No MError error present. 0x1 MError error present.	R	0x0
23:0	Reserved	Read returns 0.	R	0x0000000

### 5.10.2.3 L4\_IA\_ERROR\_LOG\_L

**Table 5-95. L4\_IA\_ERROR\_LOG\_L**

<b>Address Offset</b>	0x058
<b>Physical address</b>	Please refer from <a href="#">Table 5-91</a> to <a href="#">Table 5-92</a>
<b>Description</b>	Log information about error conditions. The CODE field logs any protection violation or address hole errors detected by the initiator subsystem while decoding a request.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MULTI	Reserved				CODE	Reserved																									

Bits	Field Name	Description	Type	Reset
31	MULTI	While the CODE field is not zero, the MULTI bit is asserted whenever an additional error is detected. Once set by hardware, the MULTI bit can only be cleared by writing a 1 to it while writing a value other than zero to the CODE field.	RW	0
30:26	Reserved	Read returns 0.	R	0x00

Bits	Field Name	Description	Type	Reset
25:24	CODE	The error code of an initiator request. 0x00: No errors 0x01: Reserved 0x10: Address hole 0x11: Protection violation The CODE field, once set by hardware, can only be cleared by writing a non-zero value to it, in conjunction with writing a 1 to the MULTI bit field.	RW	0x0
23:0	Reserved	Read returns 0.	R	0x000000

### 5.10.3 L4 Target Agent (L4 TA) Register Mapping Summary

This section provides information on the L4 Target agent (TA) register module. Each of the registers within the module instance is described separately in [Table 5-96](#) to [Table 5-124](#).

[Table 5-96](#) to [Table 5-125](#) provide information on the L4 Target Agent having two supplementary registers OCP\_CONTROL and OCP\_STATUS

The TA register block consists of the status and control registers that can be used to configure the interfaces of the targets.

### 5.10.4 L4 Target Agent (L4 TA) Register Descriptions

#### 5.10.4.1 L4\_TA\_AGENT\_CONTROL\_L

**Table 5-126. L4\_TA\_AGENT\_CONTROL\_L**

<b>Address Offset</b>	0x020
<b>Physical address</b>	Please refer from <a href="#">Table 5-96</a> to <a href="#">Table 5-125</a>
<b>Description</b>	Enable error reporting
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								SERROR_REP	Reserved												REQ_TIMEOUT	Reserved								OCP_RESET	

Bits	Field Name	Description	Type	Reset
31:25	Reserved	Read returns 0.	R	0x00
24	SERROR_REP	Enable logging of error	R	0x0
23:11	Reserved	Read returns 0.		
10:8	REQ_TIMEOUT	Timeout Bound. Values are:0 - No timeout 1 - 1x base cycles 2 - 4x base cycles 3 - 16x base cycles 4 - 64x base cycles	RW	0x2
7:1	Reserved	Read returns 0.	R	0x00
0	OCP_RESET	The OCP_RESET field controls the OCP reset signal to the attached core. Setting this bit clears any pending transfers and resets the OCP interface. The bit must be cleared to de-assert the OCP reset signal. When the software reset feature is available on a target agent, the target agent OCP must also have a reset signal directed to the target core.	RW	0

Reserved								Reserved																REQ_TIMEOUT	Reserved							

Bits	Field Name	Description	Type	Reset
31:24	Reserved	Read returns 0.	R	0x00
23:9	Reserved	Read returns 0.	R	0x0001
8	REQ_TIMEOUT	0x0: No request timeout 0x1: A request timeout has occurred	R 1toCLR	0
7:0	Reserved	Read returns 0.	R	0x00

### 5.10.5 L4 Link Register Agent (LA) Register Mapping Summary

This section provides information on the L4-Core link agent (LA) register module. Each of the registers within the module instance is described separately in [Table 5-129](#).

The LA register block contains the initiator subsystem information register and the composite sideband signal mask and status registers.

**Table 5-129. L4 LA Register Mapping Summary**

Register Name	Type	Register Width (Bits)	CORE_LA Physical Address	PER_LA Physical Address	EMU_LA Physical Address	WKUP_LA Physical Address	
L4_LA_NETWORK_H	R	32	0x4804 1014	0x4900 1014	0x5400 7014	0x4832 9014	<a href="#">Section 5.10.6.1</a>

## 5.10.6 L4 Link Register Agent (LA) Register Descriptions

### 5.10.6.1 L4\_LA\_NETWORK\_H

**Table 5-130. L4\_LA\_NETWORK\_H**

<b>Address Offset</b>	0x014
<b>Physical address</b>	Please refer to <a href="#">Table 5-129</a>
<b>Description</b>	Identify the interconnect
<b>Type</b>	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID																															

Bits	Field Name	Description	Type	Reset
31:0	ID	The ID field uniquely identifies this interconnect, and can serve as a chip ID.	R	0x00010000

### 5.10.6.2 L4\_LA\_INITIATOR\_INFO\_L

**Table 5-131. L4\_LA\_INITIATOR\_INFO\_L**

<b>Address Offset</b>	0x018
<b>Physical address</b>	Please refer to <a href="#">Table 5-129</a>
<b>Description</b>	Contain initiator subsystem information.
<b>Type</b>	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				PROT_GROUPS				NUMBER_REGIONS								Reserved								SEGMENTS							

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0.	R	0x0
27:24	PROT_GROUPS	The number of protection groups. The PROT_GROUPS field contains read-only configuration information for the address mapping and security structure of the initiator subsystem. If the PROT_GROUPS field is set to 0, there are no protection group registers.	R	see <a href="#">Table 5-132</a>
23:16	NUMBER_REGIONS	The number of regions. The NUMBER_REGIONS field contains read-only configuration information for the region register of the initiator subsystem.	R	see <a href="#">Table 5-132</a>
15:4	Reserved	Read returns 0.	R	0x000
3:0	SEGMENTS	The number of segments. The SEGMENT fields contains read-only configuration information for the segment register of the initiator subsystem.	R	see <a href="#">Table 5-132</a>

**Table 5-132. Reset value for L4\_LA\_INITIATOR\_INFO\_L**

Field Name	CORE_LA	PER_LA	EMU_LA	WKUP_LA
PROT_GROUPS	0x8	0x8	0x8	0x8
NUMBER_REGIONS	0x64	0x2B	0x1A	0x13
SEGMENTS	0x6	0x5	0x3	0x2

### 5.10.6.3 L4\_LA\_INITIATOR\_INFO\_H

**Table 5-133. L4\_LA\_INITIATOR\_INFO\_H**

<b>Address Offset</b>	0x01C
<b>Physical address</b>	Please refer to <a href="#">Table 5-129</a>
<b>Description</b>	Contain initiator subsystem information.
<b>Type</b>	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								THREADS				Reserved	CONNID_WIDTH		Reserved	BYTE_DATA_WIDTH_EXP		Reserved			ADDR_WIDTH										

Bits	Field Name	Description	Type	Reset
31:19	Reserved	Read returns 0.	R	0x0000
18:16	THREADS	The THREADS field specifies the number of initiator threads connected to the interconnect. The field contains read-only configuration information for the initiator subsystem.	R	see <a href="#">Table 5-134</a>
15	Reserved	Read returns 0.	R	0
14:12	CONNID_WIDTH	The initiator subsystem connID width. The CONNID_WIDTH field contains read-only configuration information for the initiator subsystem.	R	see <a href="#">Table 5-134</a>
11	Reserved	Read returns 0.	R	0
10:8	BYTE_DATA_WIDTH_EXP	This field specifies the initiator subsystem data width. 1:2^1 bytes specifies a 16-bit data width and 2:2^2 bytes specifies a 32-bit data width. The BYTE_DATA_WIDTH_EXP field contains read-only configuration information for the initiator subsystem.	R	see <a href="#">Table 5-134</a>
7:5	Reserved	Read returns 0.	R	0x0
4:0	ADDR_WIDTH	This field specifies the initiator subsystem address width. The ADDR_WIDTH field contains read-only configuration information for the initiator subsystem.	R	see <a href="#">Table 5-134</a>

**Table 5-134. Reset value for L4\_LA\_INITIATOR\_INFO\_H**

Field Name	CORE_LA	PER_LA	EMU_LA	WKUP_LA
THREADS	0x4	0x4	0x2	0x2
CONNID_WIDTH	0x4	0x4	0x4	0x0
BYTE_DATA_WIDTH_EXP	0x2	0x2	0x2	0x2
ADDR_WIDTH	0x18	0x14	0x18	0x14

**5.10.6.4 L4\_LA\_NETWORK\_CONTROL\_L**
**Table 5-135. L4\_LA\_NETWORK\_CONTROL\_L**

<b>Address Offset</b>	0x020
<b>Physical address</b>	Please refer to <a href="#">Table 5-129</a>
<b>Description</b>	Control interconnect minimum timeout values.
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																TIMEOUT_BASE		Reserved													

Bits	Field Name	Description	Type	Reset
31:11	Reserved	Read returns 0.	R	0x000000
10:8	TIMEOUT_BASE	The TIMEOUT_BASE field indicates the timeout period (that is, base cycles) for the highest frequency time-base signal sent from the L4 initiator subsystem to all target agents that have timeout enabled. Values for the field are: 0 - Timeout disabled 1 - L4 interconnect clock cycles divided by 64 2 - L4 interconnect clock cycles divided by 256 3 - L4 interconnect clock cycles divided by 1024 4 - L4 interconnect clock cycles divided by 4096	RW	0x4
7:0	Reserved	Read returns 0.	R	0x00

**5.10.6.5 L4\_LA\_NETWORK\_CONTROL\_H**
**Table 5-136. L4\_LA\_NETWORK\_CONTROL\_H**

<b>Address Offset</b>	0x024
<b>Physical address</b>	Please refer to <a href="#">Table 5-129</a>
<b>Description</b>	Control interconnect global power control
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								CLOCK_GATE_DISABLE	Reserved			THREAD0_PRI	Reserved										EXT_CLOCK	Reserved							

Bits	Field Name	Description	Type	Reset
31:25	Reserved	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	Reserved	Read returns 0.	R	0x0
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	1
19:9	Reserved	Read returns 0.	R	0x000
8	EXT_CLOCK	When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	Reserved	Read returns 0.	R	0x00

### 5.10.7 L4 Address Protection (AP) Register Mapping Summary

This section provides information on the L4-Core link agent (LA) register module. Each of the registers within the module instance is described separately in [Table 5-137](#).

The AP register block contains the segment, address region, and protection group registers that can be used to specify the addressing scheme or restrict the access of target address regions.

**Table 5-137. L4 AP Register Mapping Summary**

Register Name	Type	Register Width (Bits)	CORE_AP Physical Address	PER_AP Physical Address	Section
L4_AP_SEGMENT_i_L <sup>(1)</sup>	RW	32	0x4804 0100 + (0x08*i)	0x4900 0100 + (0x08*i)	<a href="#">Section 5.10.8.1</a>

Bits	Field Name	Description	Type	Reset
31:28	Reserved	Read returns 0	R	0x0
27:24	SEGMENT_ID	Identifies the segment to which the region is part of.	R	See <a href="#">Table 5-139</a> to <a href="#">Table 5-142</a>
23	Reserved	Read returns 0.	R	0
22:20	PROT_GROUP_ID	The protection group containing this region.	RW	See <a href="#">Table 5-139</a> to <a href="#">Table 5-142</a>
19:17	BYTE_DATA_WIDTH_EXP	The target OCP data byte width is 2 <sup>(BYTE_DATA_WIDTH_EXP)</sup> bytes. The value of this field is derived from the target OCP data_width parameter.	R	See <a href="#">Table 5-139</a> to <a href="#">Table 5-142</a>
16:6	Reserved	Read returns 0.	R	0x0
5:1	SIZE	Define the size of the region in bytes. 2 <sup>SIZE</sup> equals the region.	R	See <a href="#">Table 5-139</a> to <a href="#">Table 5-142</a>
0	ENABLE	0x0: Disable the region, no access allows 0x1: Enable the region, with access as define in registers	R	See <a href="#">Table 5-139</a> to <a href="#">Table 5-142</a>

## 5.11 Revision History

[Table 5-151](#) lists the changes made since the previous version of this document.

**Table 5-151. Document Revision History**

<b>Reference</b>	<b>Additions/Modifications/Deletions</b>
<a href="#">Chapter 5</a>	Added last sentence to note.
<a href="#">Section 5.6.8.6</a>	Changed resets and corrected bit names.
<a href="#">Section 5.6.8.7</a>	Changed resets and corrected bit names.
<a href="#">Table 5-65</a>	Added reserved column.

## ***Interprocessor Communication (IPC) Module***

---

---

This chapter describes the interprocessor communication (IPC) module in the OMAP35x Applications Processor.

<b>Topic</b>	<b>Page</b>
<b>6.1 IPC Overview .....</b>	<b>792</b>
<b>6.2 IPC Integration .....</b>	<b>793</b>
<b>6.3 IPC Mailbox Functional Description .....</b>	<b>796</b>
<b>6.4 IPC Mailbox Basic Programming Model .....</b>	<b>799</b>
<b>6.5 IPC Mailbox Use Cases and Tips .....</b>	<b>804</b>
<b>6.6 IPC Mailbox Registers .....</b>	<b>810</b>
<b>6.7 Revision History .....</b>	<b>817</b>

## 6.1 IPC Overview

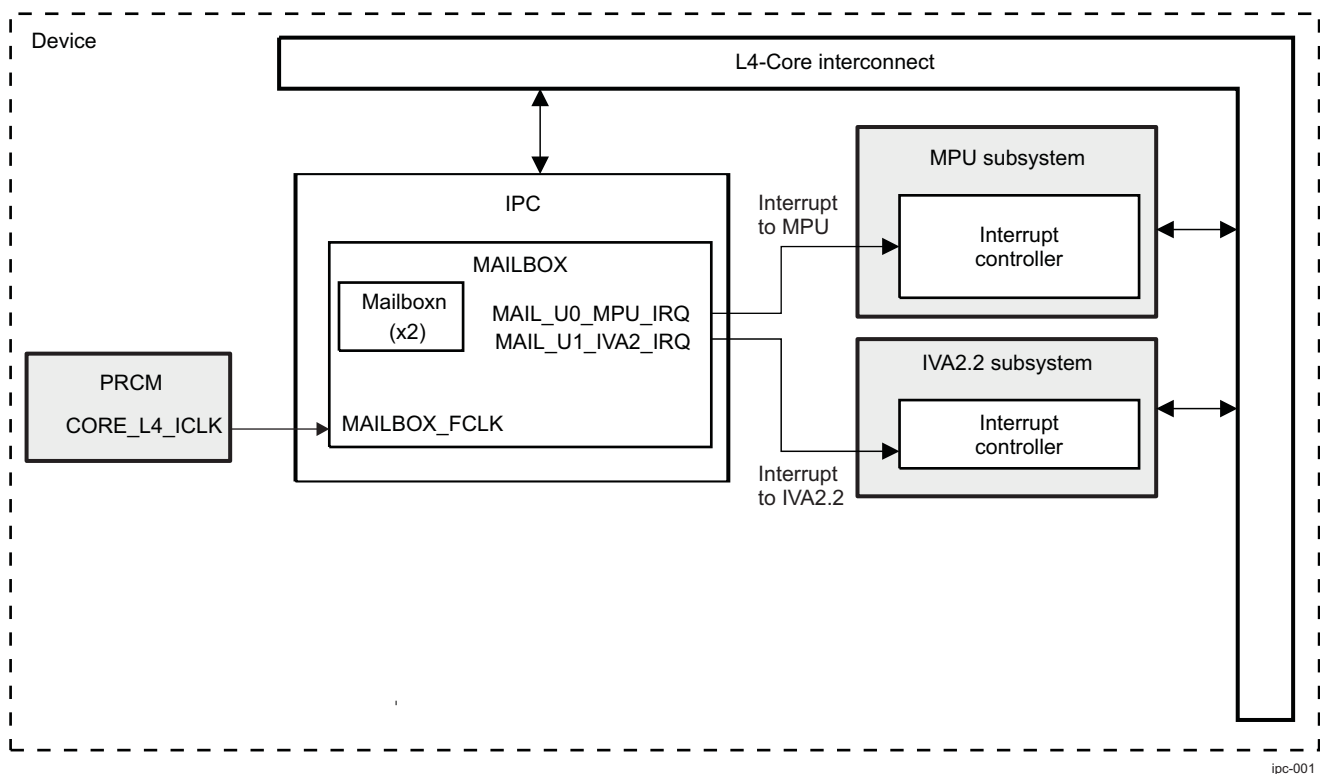

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *OMAP35x Family* section, and your device-specific data manual.

Figure 6-1 shows a block diagram of the interprocessor communication (IPC) module.

**Figure 6-1. Simplified Block Diagram of the IPC**

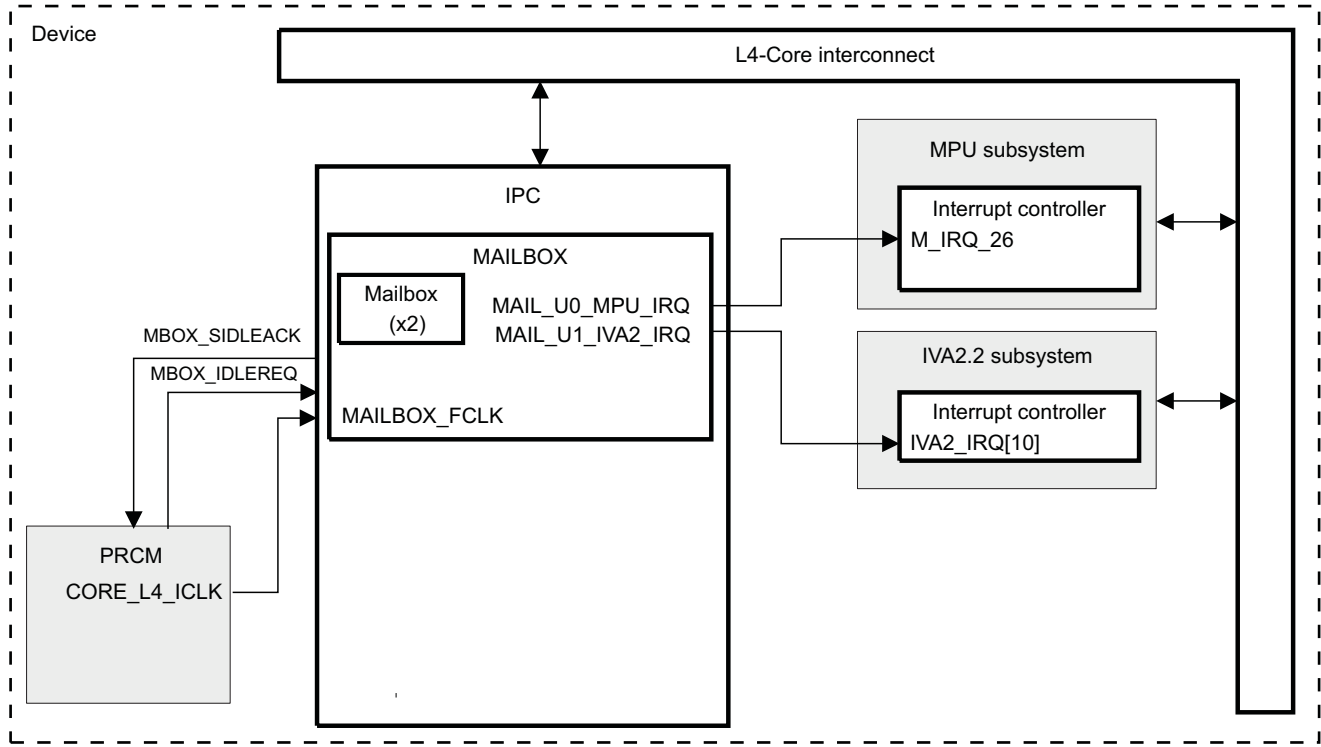

The mailbox module includes these features:

- Two mailbox message queues for microprocessor unit (MPU) and imaging video and audio accelerator (IVA2.2) communications.
- Flexible assignment of receiver and sender for each mailbox through interrupt configuration
- 32-bit message width
- Four-message FIFO depth for each message queue
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support
- Automatic idle mode for power savings

## 6.2 IPC Integration

Figure 6-2 highlights the IPC integration in the device.

Figure 6-2. IPC Integration

ipc-002

### 6.2.1 Clocking, Reset, and Power-Management Scheme

#### 6.2.1.1 Clocks

##### 6.2.1.1.1 Module Clocks

The mailbox module receives one input clock, `CORE_L4_ICLK`, from the power, reset, and clock management (PRCM) module. `CORE_L4_ICLK` is gated internally and can be turned off to lower operating power when a module is not active. The exact frequency of this clock depends on PRCM programming.

#### 6.2.1.2 Resets

The IPC supports both a hardware reset and a software reset.

##### 6.2.1.2.1 Hardware Reset

The mailbox module receives its reset signal, `CORE_RST` (the reset signal of the CORE power domain), from the PRCM module.

##### 6.2.1.2.2 Software Reset

The mailbox module supports a software reset by accessing the `MAILBOX.MAILBOX_SYSCONFIG[1] SOFTRESET` bit (0: normal mode, 1: module is reset).

### 6.2.1.3 Power Domains

The mailbox module connects to the CORE power domain.

### 6.2.1.4 Power Management

#### 6.2.1.4.1 System Power Management

This section describes system power management for the mailbox module.

As part of the system-wide power-management scheme, the mailbox module supports a communication protocol with the PRCM that allows the PRCM to request the mailbox to enter a low-power state. When the mailbox module acknowledges a low-power-mode request from the PRCM, the clock to the module is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock-gating method in the local power management.

The PRCM.CM\_ICLKEN1\_CORE[7] EN\_MAILBOXES bit in the PRCM module controls the mailbox clock. When this bit is 1, the clock to the mailbox module is enabled; otherwise, the clock is disabled (see the *Power, Reset, and Clock Management* chapter for more information).

The mailbox module can be configured using the MAILBOX.MAILBOX\_SYSCONFIG[4:3] SIDLEMODE field to one of the following acknowledgment modes:

- No-idle mode: The mailbox module never enters the idle state.
- Force-idle mode: The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- Smart-idle mode: After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

Table 6-1 describes the mailbox power-management modes.

**Table 6-1. Mailbox Power Management Modes**

Power-Management Mode Requested by the PRCM	MAILBOX.MAILBOX_SYSCONFIG[4:3] SIDLEMODE Field (Offset: 0x010)
Force-idle	00
No-idle	01
Smart-idle	10
Reserved (not used)	11

**NOTE:** The mailbox idle status can be read from the PRCM.CM\_IDLEST1\_CORE[7] ST\_MAILBOXES bit. When this bit is 0, the mailbox module cannot be accessed; otherwise, the mailbox module can be accessed (see the *Power, Reset, and Clock Management* chapter for more information).

#### 6.2.1.4.2 Module Power Management

This section describes local power management for the mailbox module.

To conserve power, the mailbox module supports an automatic idle mode whenever no activity is detected on the mailbox L4-Core interconnect interface. The automatic idle mode is enabled or disabled through the MAILBOX.MAILBOX\_SYSCONFIG[0] AUTOIDLE bit.

When the MAILBOX.MAILBOX\_SYSCONFIG[0] AUTOIDLE bit is asserted, the automatic idle mode is enabled in cases in which no activity is detected on the L4-Core interconnect interface, and the mailbox clock is disabled internally to the module, thus reducing power consumption.

When new activity is detected on the L4-Core interconnect interface, the clock is restarted with no latency penalty. After reset, the automatic idle mode is disabled; therefore, it is recommended that software enable the automatic idle mode for reduced power consumption.

---

**NOTE:** The PRCM.CM\_AUTOIDLE1\_CORE[7] AUTO\_MAILBOXES bit controls whether the mailbox interface clock is enabled or disabled in synchronization with the CORE power domain state transition (see *the Power, Reset, and Clock Management* chapter for more information).

---

## 6.2.2 Hardware Requests

### 6.2.2.1 Interrupt Requests

The mailbox module can generate two interrupts:

- MAIL\_U0\_MPU\_IRQ, mapped on M\_IRQ\_26 of the MPU subsystem interrupt controller
- MAIL\_U1\_IVA2\_IRQ, mapped on IVA2\_IRQ[10] of the IVA2.2 subsystem interrupt controller

Each interrupt allows the user (MPU subsystem or IVA2.2 subsystem) of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user.

### 6.2.2.2 Idle Handshake Protocol

The PRCM module handles an idle handshake protocol for the mailbox module. The PRCM requires the mailbox module to enter idle mode. The mailbox module acknowledges when it is ready.

## 6.3 IPC Mailbox Functional Description

**NOTE:** In the mailbox functional description,  $u$  is the user number from 0 to 1 and  $m$  is the mailbox number from 0 to 1.

The mailbox module provides a means of communication through message queues among the MPU and the IVA2.2. The two individual mailbox modules, or FIFOs, can associate with any of the processors using the MAILBOX.MAILBOX\_IRQENABLE\_ $u$  registers.

The mailbox module includes the following two user subsystems:

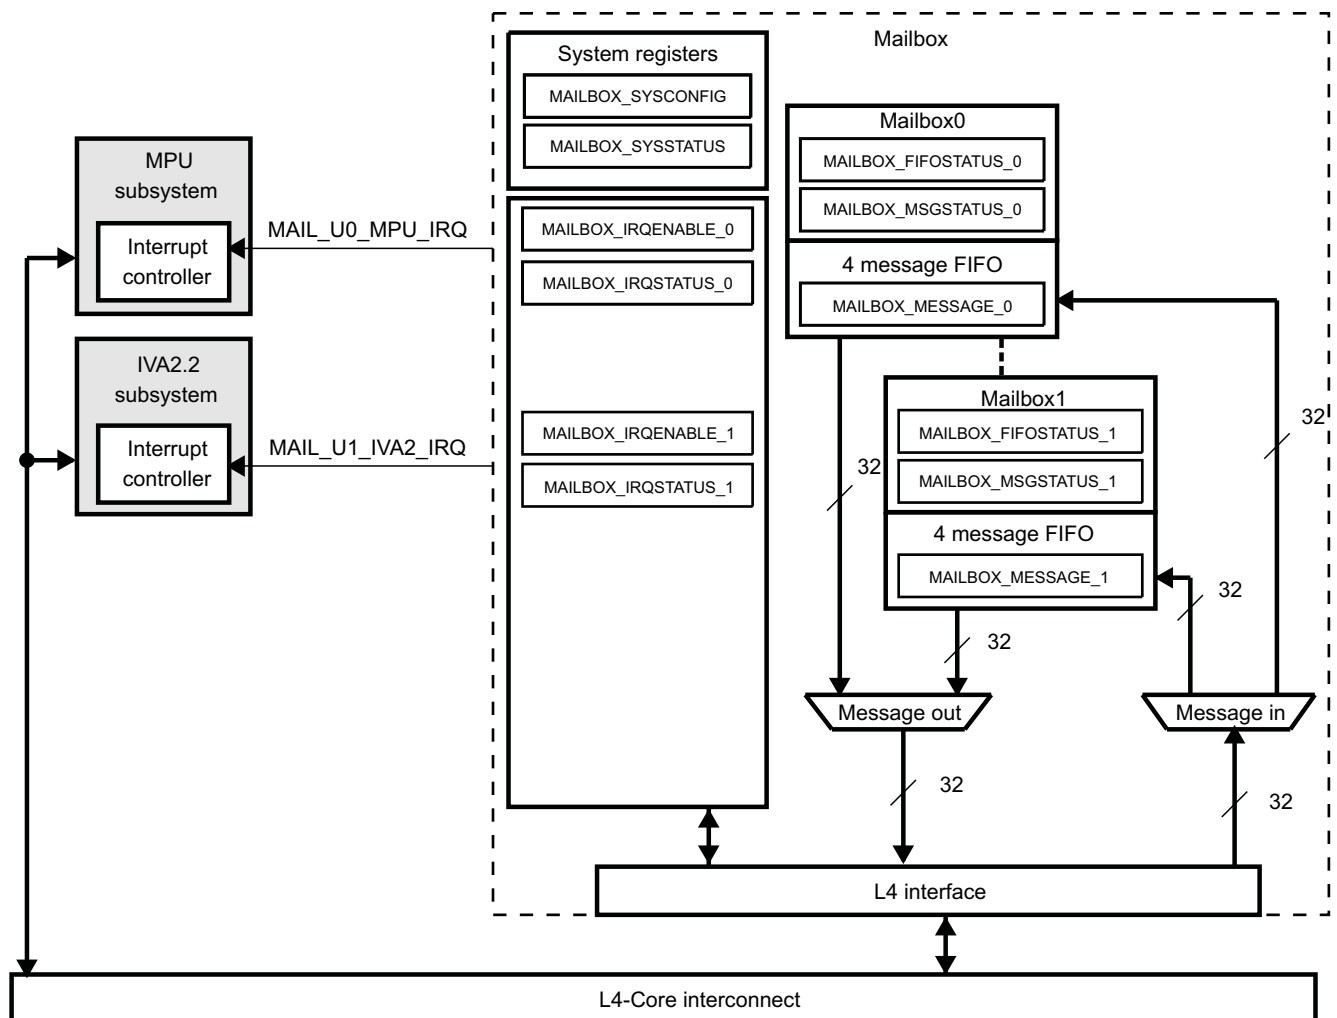

- User 0: MPU subsystem ( $u = 0$ )
- User 1: IVA2.2 subsystem ( $u = 1$ )

Each user has a dedicated interrupt signal from the mailbox module and a dedicated pair of interrupt enabling and status registers. Each MAILBOX.MAILBOX\_IRQSTATUS\_ $u$  interrupt status register corresponds to a particular user. A user can query its interrupt status register through the L4-Core interconnect.

### 6.3.1 Block Diagram

Figure 6-3 shows the mailbox block diagram.

**Figure 6-3. Mailbox Block Diagram**

ipc-003

## 6.3.2 Mailbox Assignment

### 6.3.2.1 Description

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the MAILBOX.MAILBOX\_IRQENABLE\_u register. The receiver reads the MAILBOX.MAILBOX\_MESSAGE\_m register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the MAILBOX.MAILBOX\_FIFOSTATUS\_m and/or MAILBOX.MAILBOX\_MSGSTATUS\_m registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the MAILBOX.MAILBOX\_IRQENABLE\_u register, where *u* is the number of the receiving user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the MAILBOX.MAILBOX\_FIFOSTATUS\_m or MAILBOX.MAILBOX\_MSGSTATUS\_m registers
- Write the message to the corresponding MAILBOX.MAILBOX\_MESSAGE\_m register, if space is available.

The sender should use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate MAILBOX.MAILBOX\_IRQENABLE\_u register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the MAILBOX.MAILBOX\_IRQSTATUS\_u register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the same register location acknowledges, and subsequently clears, an interrupt.

#### **CAUTION**

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

## 6.3.3 Sending and Receiving Messages

### 6.3.3.1 Description

When a 32-bit message is written to the MAILBOX.MAILBOX\_MESSAGE\_m register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded.

Queue overflow can be avoided by first reading the MAILBOX.MAILBOX\_FIFOSTATUS\_m register to check that the mailbox message queue is not full before writing a new message to it.

Reading the MAILBOX.MAILBOX\_MESSAGE\_m register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the MAILBOX.MAILBOX\_MESSAGE\_m register is read, the value 0 is returned.

The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the MAILBOX.MAILBOX\_MSGSTATUS\_m register.

## 6.3.4 16-Bit Register Access

### 6.3.4.1 Description

So that 16-bit processors can access the mailbox module, the device allows 16-bit register read and write access, with restrictions for the MAILBOX.MAILBOX\_MESSAGE\_m registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02).

All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the MAILBOX.MAILBOX\_MESSAGE\_m registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

#### CAUTION

When using 16-bit accesses, it is critical to ensure that the mailbox used has only one assigned receiver and only one assigned sender.

When using 16-bit accesses to the MAILBOX.MAILBOX\_MESSAGE\_m registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is due to the update operation by the message FIFO of the MAILBOX.MAILBOX\_MSGSTATUS\_m registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a MAILBOX.MAILBOX\_MESSAGE\_m are accessed.

## 6.4 IPC Mailbox Basic Programming Model

### 6.4.1 Initialization Flow for the Mailbox Module

The initialization flow for the mailbox module consists of the following steps:

1. Perform a software reset of the mailbox module (see [Section 6.4.1.1, Software Reset](#)).
2. Set the idle mode and clock configuration of the mailbox module (see [Section 6.4.1.2, Idle Mode and Clock Configuration](#)).

#### 6.4.1.1 Software Reset

To perform a software reset, write 1 in the MAILBOX.MAILBOX\_SYSCONFIG[1] SOFTRESET bit. The MAILBOX.MAILBOX\_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1.

When the software reset completes, the MAILBOX.MAILBOX\_SYSCONFIG[1] SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing mailbox operations.

#### CAUTION

When performing a software reset by writing 1 in the MAILBOX.MAILBOX\_SYSCONFIG[1] SOFTRESET bit, 0 must be written in the other bits of the MAILBOX.MAILBOX\_SYSCONFIG register.

#### 6.4.1.2 Idle Mode and Clock Configuration

The idle mode and clock configuration is done by setting the MAILBOX.MAILBOX\_SYSCONFIG[4:3] SIDLEMODE field and the MAILBOX.MAILBOX\_SYSCONFIG[0] AUTOIDLE bit (see [Section 6.6, Mailbox Registers](#), for more information).

### 6.4.2 Mailbox Assignment

Before communicating, mailboxes can be explicitly assigned to a user using the appropriate MAILBOX.MAILBOX\_IRQENABLE\_u register. The software must ensure that only one sender and one receiver are assigned per mailbox.

For example, to assign mailbox 1 ( $m = 1$ ) to the MPU ( $u = 0$ , see [Section 6.3, Mailbox Functional Description](#), for the user number) as a receiver, set the MAILBOX.MAILBOX\_IRQENABLE\_0[2] NEWMSGENABLEUUMB1 bit to generate an interrupt to the MPU when a new message is received in mailbox 1.

To assign mailbox 0 ( $m = 0$ ) to the MPU ( $u = 0$ ) as a sender, set the MAILBOX.MAILBOX\_IRQENABLE\_0[1] NOTFULLENABLEUUMB0 bit to generate an interrupt to the MPU when the message queue of mailbox 0 is not full.

### 6.4.3 Mailbox Communication Preparation

Before communicating with another user, the sender must first use one of the following methods to determine that the mailbox message FIFO queue is not full:

- Poll the MAILBOX.MAILBOX\_FIFOSTATUS\_m[0] FIFOFULLMB bit or the MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field to determine if there is an open slot available to write a message.

- If the queue-not-full interrupt is enabled by setting the corresponding bit in the MAILBOX.MAILBOX\_IRQENABLE\_u register, an interrupt to the sender indicates that the mailbox has an available slot. To avoid continuous interrupt to the sender, it is recommended that the software waits until the message queue is full by reading the MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field before enabling the interrupt in the MAILBOX.MAILBOX\_IRQENABLE\_u register. When a queue-not-full interrupt is generated to the sender, the interrupt should be disabled until the message queue is full for the same reason.

The receiver can also detect new messages from another user using two methods:

- Poll the MAILBOX.MAILBOX\_FIFOSTATUS\_m[0] FIFOFULLMB bit or the MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field.
- Use a new message ISR (interrupt service routine). In this case, the receiver must enable the appropriate interrupt in the MAILBOX.MAILBOX\_IRQENABLE\_u register.

---

**NOTE:** After an interrupt is generated, and before exiting the ISR, write 1 in each bit responsible for this generation in the MAILBOX.MAILBOX\_IRQSTATUS\_u register, thereby clearing these bits.

---

#### 6.4.4 Mailbox Communication Sequence

When a message slot is available in the mailbox, a message can be transmitted by a sender to a receiver using the following steps:

1. The sender writes a message in the MAILBOX.MAILBOX\_MESSAGE\_m register. This results in the following actions:
  - The message is stored at the tail of the FIFO queue of mailbox *m*, and the MAILBOX.MAILBOX\_FIFOSTATUS\_m and MAILBOX.MAILBOX\_MSGSTATUS\_m registers are updated.
  - If the FIFO queue was previously empty, a new message interrupt can be generated to the receiver to which the mailbox is allocated; otherwise, the interrupt is already asserted and remains so.
2. The receiver can either use an ISR or poll the MAILBOX.MAILBOX\_FIFOSTATUS\_m or MAILBOX.MAILBOX\_MSGSTATUS\_m registers to detect new messages and read them by accessing the MAILBOX.MAILBOX\_MESSAGE\_m register.
  - If using interrupts, the receiver enters the ISR when it detects the new message interrupt. The receiver checks both the MAILBOX.MAILBOX\_IRQSTATUS\_u register to determine the source of the interrupt and the MAILBOX.MAILBOX\_MSGSTATUS\_m register(s) to determine the number of messages in the FIFO queue.
  - The receiver can poll the appropriate MAILBOX.MAILBOX\_MSGSTATUS\_m register(s) to check the status and determine if there are any pending messages to read. The receiver can read the MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field to determine how many messages are available.
3. Using either ISR or polling method, when the receiver determines that it has a message pending in a mailbox, it repeatedly reads the MAILBOX.MAILBOX\_MESSAGE\_m register to remove all messages from the FIFO queue until a read in the MAILBOX.MAILBOX\_MSGSTATUS\_m register indicates no more messages are available (MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field = 0x00).
4. After reading all of the messages, the receiver can acknowledge the new message interrupt by writing 1 in the appropriate bit of the MAILBOX.MAILBOX\_IRQSTATUS\_u register to clear the interrupt flag before exiting the ISR.

#### 6.4.5 Example of Communication

This example shows how communication is established between the MPU and IVA2.2 subsystems in the device. The MPU subsystem sends messages to the IVA2.2 subsystem through mailbox 0, and the IVA2.2 subsystem sends messages to the MPU subsystem through mailbox 1.

To establish communication, the software follows these steps:

1. Turn on the automatic idle feature by writing 1 in the MAILBOX.MAILBOX\_SYSCONFIG[0] AUTOIDLE bit.
2. Configure the mailbox in smart-idle mode by setting the MAILBOX.MAILBOX\_SYSCONFIG[4:3] SIDLEMODE field in smart-idle mode (smart-idle is the recommended mode; see [Section 6.6, Mailbox Registers](#), for more information). Smart-idle mode allows the PRCM low-power-mode requests to be acknowledged only after clearing any pending interrupts.
3. Write 1 in the MAILBOX.MAILBOX\_IRQENABLE\_1[0] NEWMSGENABLEUUMB0 bit to enable interrupts to the IVA2.2 subsystem when a new message is received in mailbox 0.
4. Write 1 in the MAILBOX.MAILBOX\_IRQENABLE\_0[2] NEWMSGENABLEUUMB1 bit to enable interrupts to the MPU subsystem when a new message is received in mailbox 1.
5. Enable interrupts in the corresponding subsystems.

#### 6.4.5.1 Sending a Message (Polling Method)

To send a message using the polling method, the MPU or IVA2.2 subsystem follows these steps:

1. The MPU subsystem (or IVA2.2 subsystem) determines if the message queue of mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full by reading the MAILBOX.MAILBOX\_FIFOSTATUS\_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX\_FIFOSTATUS\_1[0] FIFOFULLMB bit for the IVA2.2 subsystem).
2. If the MAILBOX.MAILBOX\_FIFOSTATUS\_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX\_FIFOSTATUS\_1[0] FIFOFULLMB bit for the IVA2.2 subsystem) is 0, mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) has a message slot available to store a new message; go to step 4.
3. If the MAILBOX.MAILBOX\_FIFOSTATUS\_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX\_FIFOSTATUS\_1[0] FIFOFULLMB bit for the IVA2.2 subsystem) is 1, mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full; go back to step 1.
4. The MPU subsystem (or IVA2.2 subsystem) can send a message by writing it into the MAILBOX.MAILBOX\_MESSAGE\_0 register (or the MAILBOX.MAILBOX\_MESSAGE\_1 register for the IVA2.2 subsystem).

#### 6.4.5.2 Sending a Message (Interrupt Method)

To send a message using the interrupt method, the MPU or IVA2.2 subsystem follows these steps:

1. To avoid continuous interruption, the MPU subsystem (or the IVA2.2 subsystem) must determine if mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full by reading the MAILBOX.MAILBOX\_FIFOSTATUS\_0[0] FIFOFULLMB bit (or the MAILBOX.MAILBOX\_FIFOSTATUS\_1[0] FIFOFULLMB bit for the IVA2.2 subsystem).
2. If mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is full, the MPU subsystem (or the IVA2.2 subsystem) can enable the queue-not-full interrupt by setting the MAILBOX.MAILBOX\_IRQENABLE\_0[1] NOTFULLENABLEUUMB0 bit (or the MAILBOX.MAILBOX\_IRQENABLE\_1[3] NOTFULLENABLEUUMB1 bit for the IVA2.2 subsystem), and perform another task before an interrupt occurs; go to step 4).
3. If mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is not full, the MPU can go back to step 1 and wait for mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) to fill, or the MPU can send a message, if necessary, by writing in the MAILBOX.MAILBOX\_MESSAGE\_0 register (or the MAILBOX.MAILBOX\_MESSAGE\_1 register for the IVA2.2 subsystem).
4. After receiving an interrupt, the MPU subsystem (or the IVA2.2 subsystem) enters the ISR and reads the MAILBOX.MAILBOX\_IRQSTATUS\_0[1] NOTFULLSTATUSUUMB0 bit (or the MAILBOX.MAILBOX\_IRQSTATUS\_1[3] NOTFULLSTATUSUUMB1 bit for the IVA2.2 subsystem) to determine if mailbox 0 (or mailbox 1 for the IVA2.2 subsystem) is not full and thus send its message. The MPU subsystem writes the message in the MAILBOX.MAILBOX\_MESSAGE\_0 register (or the MAILBOX.MAILBOX\_MESSAGE\_1 register for the IVA2.2 subsystem). The MPU subsystem (or the IVA2.2 subsystem) then acknowledges the interrupt by writing 1 in the MAILBOX.MAILBOX\_IRQSTATUS\_0[1] NOTFULLSTATUSUUMB0 bit (or the MAILBOX.MAILBOX\_IRQSTATUS\_1[3] NOTFULLSTATUSUUMB1 bit for the IVA2.2 subsystem).

---

**NOTE:** To send several messages, a subsystem or processor must determine if the message queue of mailbox *m* has enough available slots by checking the MAILBOX.MAILBOX\_MSGSTATUS\_m[2:0] NBOFMSGMB field before writing all of the messages in this mailbox (see [Section 6.6](#), *Mailbox Registers*, for more information).

---

### 6.4.5.3 Receiving Messages (Interrupt Method)

After receiving an interrupt indicating that a new message is received, the MPU or IVA2.2 subsystem follows these steps:

1. The MPU subsystem (or the IVA2.2 subsystem) determines how many messages are stored in the message queue of mailbox 1 by reading the MAILBOX.MAILBOX\_MSGSTATUS\_1[2:0] NBOFMSGMB field (or the MAILBOX.MAILBOX\_MSGSTATUS\_0[2:0] NBOFMSGMB field for the IVA2.2 subsystem).
2. The MPU subsystem (or the IVA2.2 subsystem) reads the MAILBOX.MAILBOX\_MESSAGE\_1 register (or the MAILBOX.MAILBOX\_MESSAGE\_0 register for the IVA2.2 subsystem) as many times as there are messages in mailbox 1 (or mailbox 0 for the IVA2.2 subsystem).
3. Finally, the MPU subsystem (or the IVA2.2 subsystem) acknowledges the interrupt by writing 1 in the MAILBOX.MAILBOX\_IRQSTATUS\_0[2] NEWMSGSTATUSUUMB1 bit (or the MAILBOX.MAILBOX\_IRQSTATUS\_1[0] NEWMSGSTATUSUUMB0 bit for the IVA2.2 subsystem).

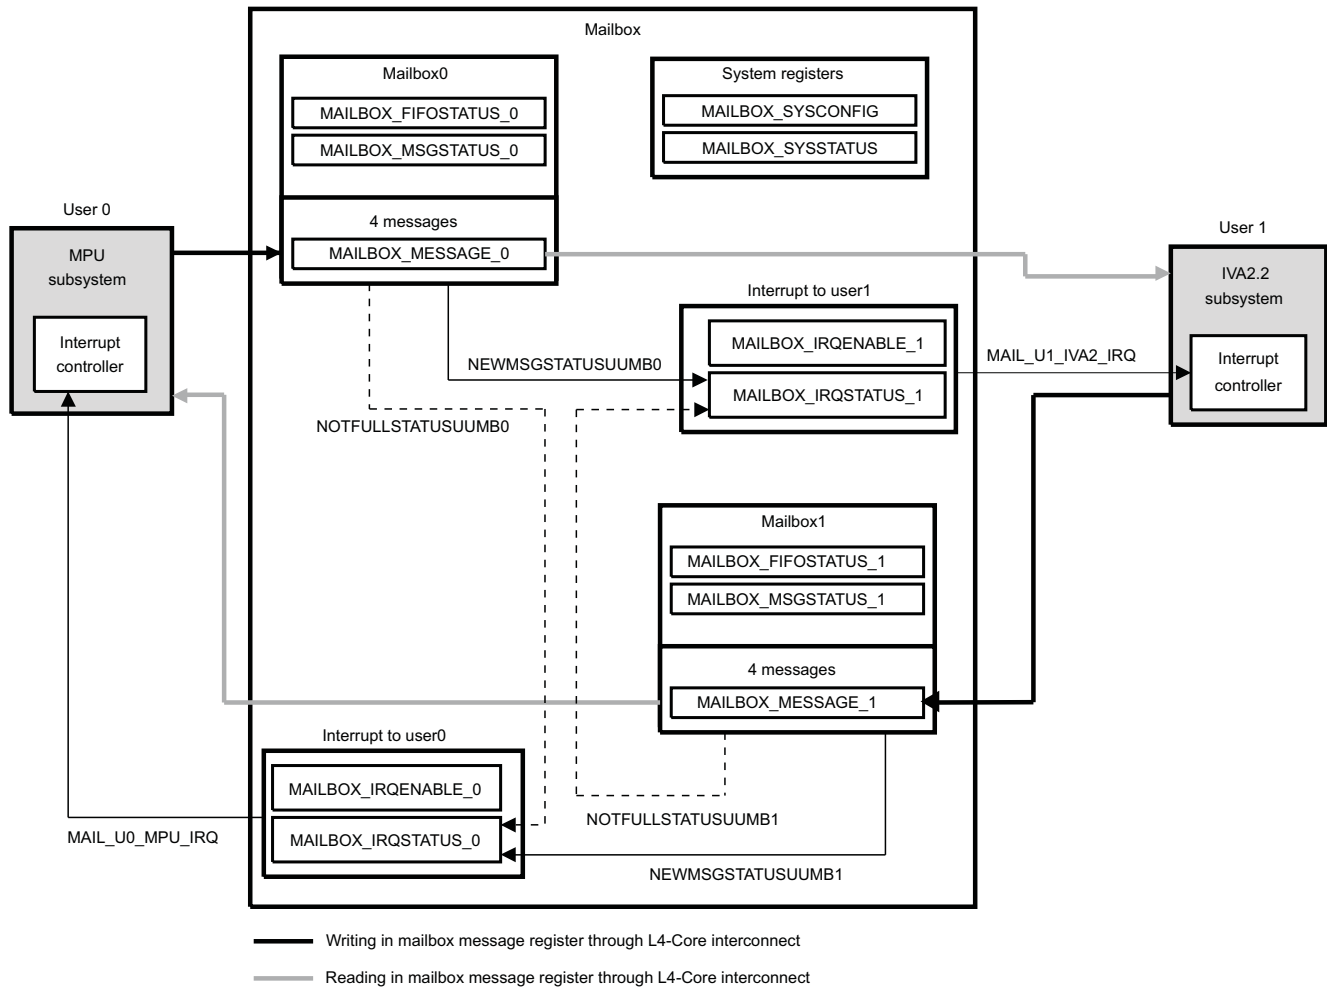

---

**NOTE:** After the interrupt is acknowledged, if the mailbox message queue is not empty, the interrupt is reasserted.

---

[Figure 6-4](#) shows an example of communication:

Figure 6-4. Example of Communication

ipc-004

## 6.5 IPC Mailbox Use Cases and Tips

### 6.5.1 Camcorder Use Case: How to Configure the Mailbox Module for Communication Between the MPU and the IVA2.2 Subsystems

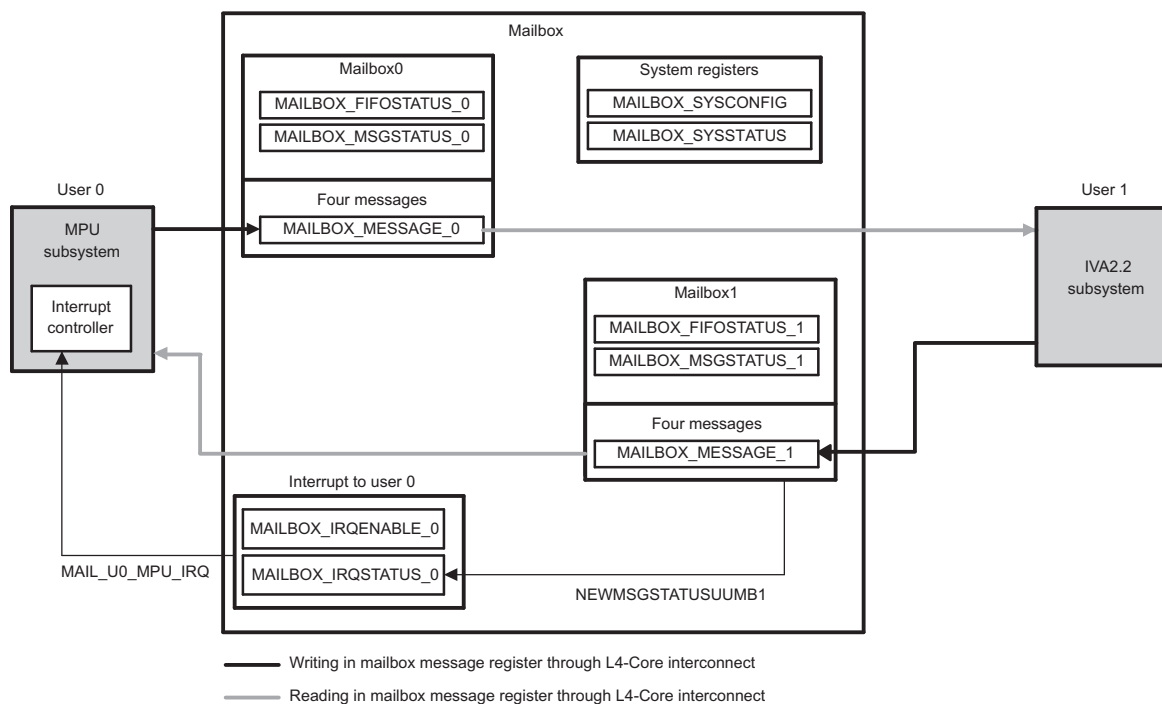

#### 6.5.1.1 Overview

In a whole Camcorder use case, the mailbox module is in charge of the communication between the MPU and the IVA2.2 subsystems in the device.

The MPU subsystem send messages to the IVA2.2 subsystem through mailbox 0: typically, an audio or video compression request (a command and a memory address). And the IVA2.2 subsystem sends messages to the MPU subsystem through mailbox 1: typically, a compression completion message with error management.

Figure 6-5 shows an overview of the use of the mailbox module in the case of the Camcorder use case.

**Figure 6-5. Overview**

ipc-005

For the Camcorder use case, the configuration is the following:

- 32-bit message width
- Use of polling method for MPU subsystem message sending (mailbox 0), IVA2.2 subsystem message receiving (mailbox 0), and IVA2.2 subsystem message sending (mailbox 1)
- Use of interrupt method for MPU subsystem message receiving (mailbox 1)
- NewMessage interrupt to the MPU subsystem indicating a new message is received on mailbox 1

#### 6.5.1.2 Programming Flow

##### 6.5.1.2.1 Initial Configuration

The initialization of the mailbox module is done in two parts:

1. Mailbox module initialization
2. Interrupt enabling

The two subsections below describe each of these initialization parts.

See [Figure 6-6](#) for the corresponding programming flowchart.

#### 6.5.1.2.1.1 Mailbox Module Initialization

To initialize the mailbox module, the following steps must be done:

1. Enable the clock for the mailbox module (set the PRCM.CM\_ICLKEN1\_CORE[7] EN\_MAILBOXES bit to 1)
2. Set the MAILBOX.MAILBOX\_SYSCONFIG[1] SOFTRESET bit to 1. This bit is automatically reset by the hardware
3. Poll the MAILBOX.MAILBOX\_SYSSTATUS[0] RESETDONE bit until it is set to 1 by the mailbox module to indicate that the mailbox module is complete

[Table 6-2](#) shows all the registers to be configured for the mailbox module initialization.

**Table 6-2. Register Print after the Mailbox Module Initialization**

Register Name	Physical Address	Value	Value Description
PRCM.CM_ICLKEN1_CORE	0x4800 4A10	0x0000 0080	EN_MAILBOXES bit set to 1 to enable the mailbox clock
MAILBOX.MAILBOX_SYSCONFIG	0x4809 4010	0x0000 0002	SOFTRESET bit set to 1 to reset the mailbox module
MAILBOX.MAILBOX_SYSSTATUS	0x4809 4014	0x0000 0001	The RESETDONE bit is set to 1 by the mailbox module when the software reset is complete

#### 6.5.1.2.1.2 Interrupt Enabling

The NewMessage interrupt is asserted when at least one message is in the mailbox message FIFO queue.

To generate an interrupt to the MPU subsystem when a new message is received on mailbox 1, set the MAILBOX.MAILBOX\_IRQENABLE\_0[2] NEWMSGENABLEUUMB1 bit to 1.

[Table 6-3](#) shows all the registers to be configured for the interrupt enabling.

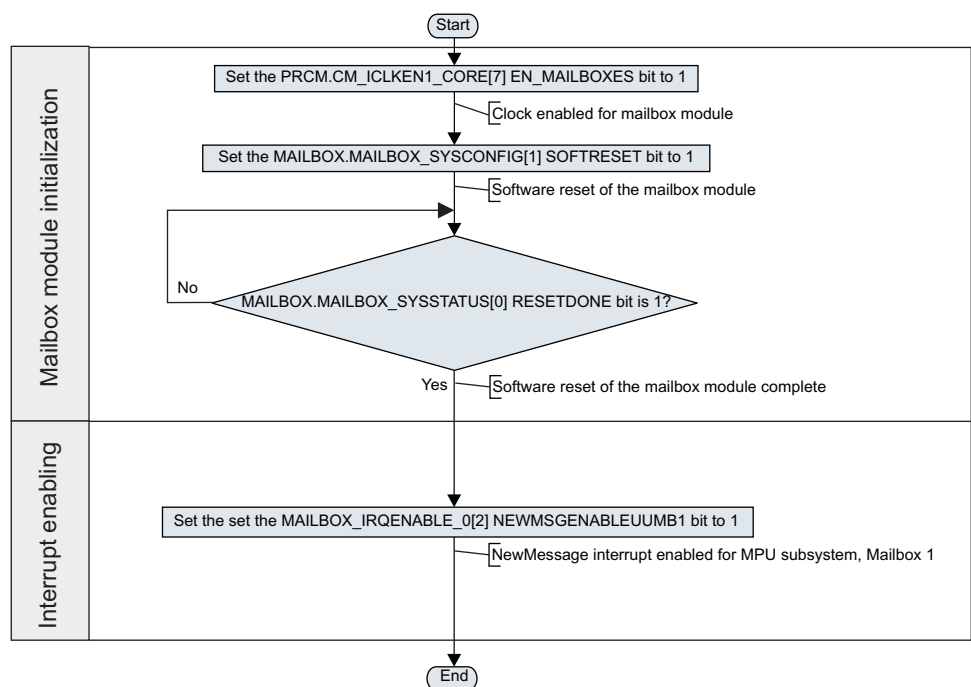

**Table 6-3. Register Print after the Interrupt Enabling**

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_IRQENABLE_0	0x4809 4104	0x0000 0004	NEWMSGENABLEUUMB1 bit is set to 1 to enable the NewMessage interrupt to the MPU subsystem on mailbox 1

### 6.5.1.2.1.3 Initial Configuration Flowchart

Figure 6-6 describes the programming flowchart corresponding to the initial configuration.

**Figure 6-6. Initial Configuration Flowchart**

ipc-006

### 6.5.1.2.2 Operational Mode

For the Camcorder use case, the communication between the MPU and the IVA2.2 subsystems is done in four parts:

1. MPU subsystem message sending (polling method)
2. IVA2.2 subsystem message receiving (polling method)
3. IVA2.2 subsystem message sending (polling method)
4. MPU subsystem message receiving (interrupt method)

#### 6.5.1.2.2.1 MPU Subsystem Message Sending (Polling Method)

To send a message with mailbox 0 using the polling method, the MPU subsystem follows these steps:

1. Poll the `MAILBOX.MAILBOX_FIFOSTATUS_0[0] FIFOFULLMB` bit until it is cleared to 0 by the mailbox module to indicate that the mailbox 0 message queue is not full
2. Write the message into the `MAILBOX.MAILBOX_MESSAGE_0` register

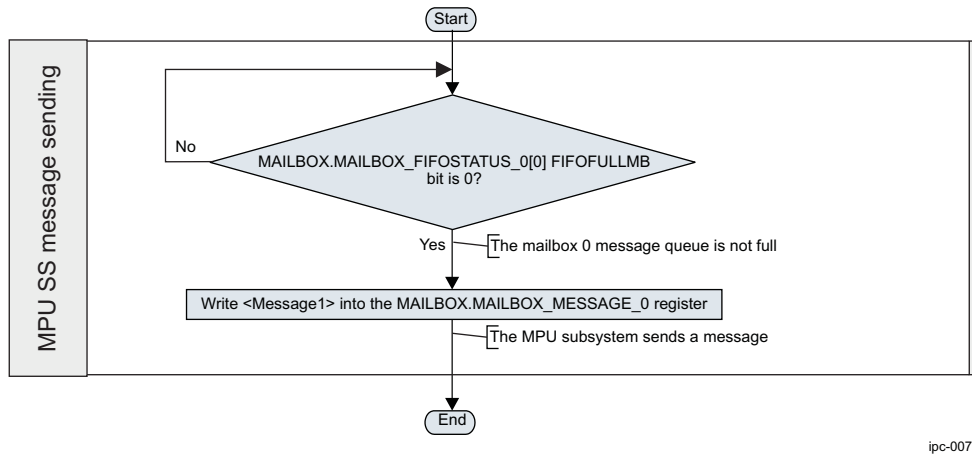

Table 6-4 shows all the registers to be configured for the MPU subsystem message sending.

**Table 6-4. Register Print after the MPU Subsystem Message Sending**

Register Name	Physical Address	Value	Value Description
<code>MAILBOX.MAILBOX_FIFOSTATUS_0</code>	0x4809 4080	0x0000 0000	FIFOFULLMB bit is cleared to 0 when the mailbox 0 message queue is not full
<code>MAILBOX.MAILBOX_MESSAGE_0</code>	0x4809 4040	<Message1>	<Message1> is written into the <code>MAILBOX.MAILBOX_MESSAGE_0</code> register

Figure 6-7 describes the programming flowchart corresponding to the MPU subsystem message sending.

**Figure 6-7. MPU Subsystem Message Sending Flowchart**

ipc-007

**6.5.1.2.2.2 IVA2.2 Subsystem Message Receiving (Polling Method)**

To receive a message with mailbox 0 using the polling method, the IVA2.2 subsystem follows these steps:

1. Poll the MAILBOX.MAILBOX\_MSGSTATUS\_0[2:0] NBOFMSGMB field until it is set to 0x1 to detect a new message in mailbox 0
2. Read the message into the MAILBOX.MAILBOX\_MESSAGE\_0 register

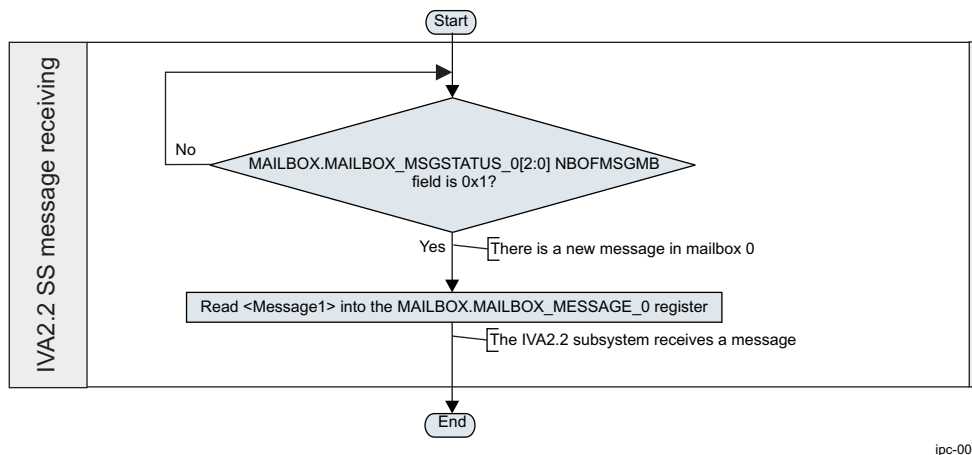

Table 6-5 shows all the registers to be configured for the IVA2.2 subsystem message receiving.

**Table 6-5. Register Print after the IVA2.2 Subsystem Message Receiving**

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_MSGSTATUS_0	0x4809 40C0	0x0000 0001	NBOFMSGMB field is set to 0x1. <Message1> is received.
MAILBOX.MAILBOX_MESSAGE_0	0x4809 4040	<Message1>	<Message1> is read into the MAILBOX.MAILBOX_MESSAGE_0 register

Figure 6-8 describes the programming flowchart corresponding to the IVA2.2 subsystem message receiving.

**Figure 6-8. IVA2.2 Subsystem Message Receiving Flowchart**

ipc-008

### 6.5.1.2.2.3 IVA2.2 Subsystem Message Sending (Polling Method)

When the IVA2.2 subsystem data processing is done, use of mailbox 1 to send a message. After sending the message, a NewMessage interrupt is generated and received by the MPU subsystem. To send a message with mailbox 1 using the polling method, the IVA2.2 subsystem follows these steps:

1. Poll the MAILBOX.MAILBOX\_FIFOSTATUS\_1[0] FIFOFULLMB bit until it is cleared to 0 by the mailbox module to indicate that the mailbox 0 message queue is not full
2. Write the message into the MAILBOX.MAILBOX\_MESSAGE\_1 register

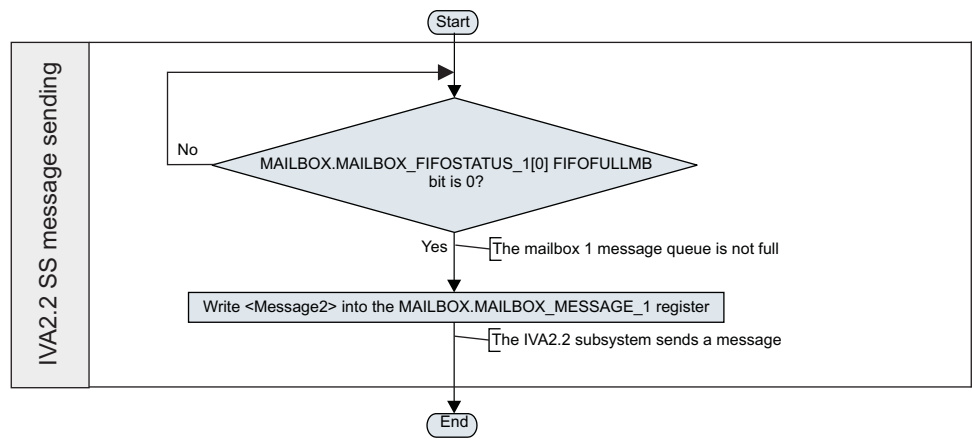

Table 6-6 shows all the registers to be configured for the IVA2.2 subsystem message sending.

**Table 6-6. Register Print after the IVA2.2 Subsystem Message Sending**

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_FIFOSTATUS_1	0x4809 4084	0x0000 0000	FIFOFULLMB bit is cleared to 0 when the FIFO is not full
MAILBOX.MAILBOX_MESSAGE_1	0x4809 4044	<Message2>	<Message2> is written into the MAILBOX.MAILBOX_MESSAGE_1 register

Figure 6-9 describes the programming flowchart corresponding to the IVA2.2 subsystem message sending.

**Figure 6-9. IVA2.2 Subsystem Message Sending Flowchart**

### 6.5.1.2.2.4 MPU Subsystem Message Receiving (Interrupt Method)

After receiving a NewMessage interrupt (indicating a new message is received), the MPU subsystem reads the message from the IVA2.2 subsystem. To receive a message with mailbox 0 using the polling method, the MPU subsystem follows these steps:

1. Read the MAILBOX\_IRQSTATUS\_0[2] NEWMSGSTATUSUMB1 bit
2. Read the message into the MAILBOX\_MESSAGE\_1 register
3. Set the MAILBOX\_IRQSTATUS\_0[2] NEWMSGSTATUSUMB1 bit to 1 to clear the interrupt flag

Table 6-7 shows all the registers to be configured for the MPU subsystem message receiving.

**Table 6-7. Register Print after the MPU Subsystem Message Receiving**

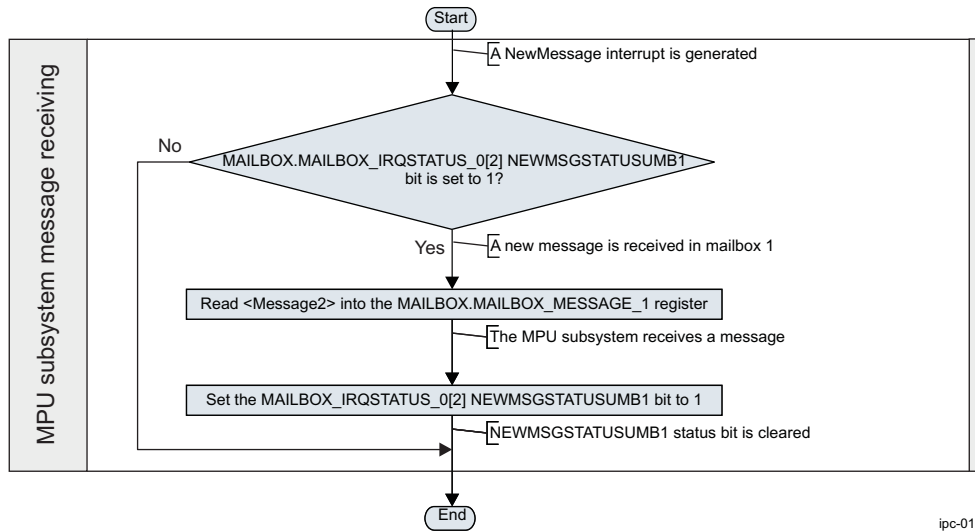

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_IRQSTATUS_0	0x4809 4100	0x0000 0004	A NewMessage interrupt is generated. NEWMSGSTATUSUMB1 status bit is set to 1.

**Table 6-7. Register Print after the MPU Subsystem Message Receiving (continued)**

Register Name	Physical Address	Value	Value Description
MAILBOX.MAILBOX_MESSAG E_1	0x4809 4044	<Message2>	<Message2> is read into the MAILBOX.MAILBOX_MESSAG E_1 register
MAILBOX.MAILBOX_IRQSTAT US_0	0x4809 4100	0x0000 0000	NEWMSGSTATUSUMB1 status bit is cleared

Figure 6-10 describes the programming flowchart corresponding to the MPU subsystem message receiving.

**Figure 6-10. MPU Subsystem Message Receiving Flowchart**

ipc-010

## 6.6 IPC Mailbox Registers

Table 6-8 summarizes the mailbox instance.

**Table 6-8. Mailbox Instance Summary**

Module Name	Base Address	Size
MLB	0x4809 4000	4K bytes

### 6.6.1 Mailbox Register Mapping Summary

Table 6-9 summarizes the MLB registers.

**Table 6-9. MLB Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address	Section
MAILBOX_SYSCONFIG	RW	32	0x010	0x4809 4010	<a href="#">Section 6.6.2.1</a>
MAILBOX_SYSSTATUS	R	32	0x014	0x4809 4014	<a href="#">Section 6.6.2.2</a>
MAILBOX_MESSAGE_m	RW	32	0x040 - 0x044	0x4809 4040 - 0x4809 4044	<a href="#">Section 6.6.2.3</a>
MAILBOX_FIFOSTATUS_m	R	32	0x080 - 0x084	0x4809 4080 - 0x4809 4084	<a href="#">Section 6.6.2.4</a>
MAILBOX_MSGSTATUS_m	R	32	0x0C0 - 0x0C4	0x4809 40C0 - 0x4809 40C4	<a href="#">Section 22.7.2.23</a>
MAILBOX_IRQSTATUS_u	RW	32	0x100 - 0x108	0x4809 4100 - 0x4809 4108	<a href="#">Section 6.6.2.6</a>
MAILBOX_IRQENABLE_u	RW	32	0x104 - 0x10C	0x4809 4104 - 0x4809 410C	<a href="#">Section 6.6.2.7</a>

**NOTE:** In MAILBOX\_MESSAGE\_0, MAILBOX\_MESSAGE\_1, MAILBOX\_FIFOSTATUS\_0, MAILBOX\_FIFOSTATUS\_1, MAILBOX\_MSGSTATUS\_0, and MAILBOX\_MSGSTATUS\_1 register names, 0 or 1 is the mailbox number.

In MAILBOX\_IRQSTATUS\_0, MAILBOX\_IRQSTATUS\_1, MAILBOX\_IRQENABLE\_0, and MAILBOX\_IRQENABLE\_1 register names, 0 or 1 is the user number:

- User 0: MPU subsystem
- User 1: IVA2.2 subsystem

## 6.6.2 IPC Register Descriptions

Table 6-10 through Table 6-16 describe the register bits.

### 6.6.2.1 MAILBOX\_SYSCONFIG

**Table 6-10. MAILBOX\_SYSCONFIG**

## 7.1 System Control Module Overview

The system control module (SCM) allows software control of the various static modes supported by the device. The SCM is on the L4-Core interconnect, but it is sensitive only to the device internal power-on reset. It is not affected by the L4-Core reset.

For emulator devices, the power-on reset can also be controlled by the debugger through the JTAG interface.

The device uses the SCM as the primary point of control for these areas:

- Functional I/O multiplexing
- Pad configuration (pull-up or pull-down enable)
- Secure mode configuration and emulation controls
- Device status
- Peripheral sensitivity to the MPU and/or the DSP (IVA2.2) MSuspend signals
- Static device configuration
- Debug and observability I/O multiplexing
- Save-and-restore pad configuration

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

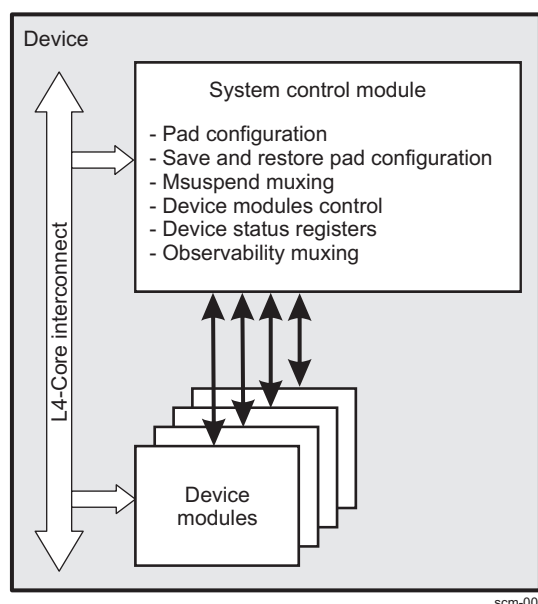

---

**NOTE:** Power domains are not supported but the IP/Modules are still part of the logical design partition in the processor's domain partition architecture.

---

Figure 7-1 provides an overview of the SCM.

**Figure 7-1. System Control Module Overview**

The SCM primarily implements a bank of registers accessible by the software. Some are read-only registers that carry status information, and others are fully accessible (read/write).

The read/write registers are divided into the following classes:

- Pad functional multiplexing and configuration registers (32-bit registers, one register per two pins)
- Debug and observability I/O multiplexing register (32-bit read/write register)

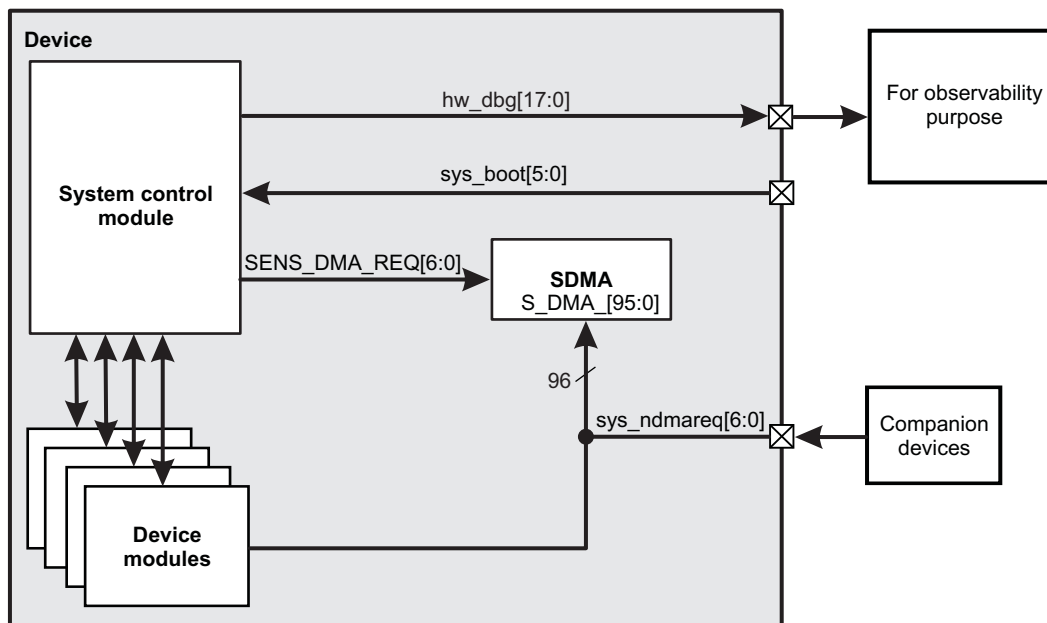

- Static device configuration registers (32-bit read/write registers for module specific configuration)
- Security and emulation control registers (32-bit registers accessible only in secure privilege mode with read/write, read/write once, or read/write to clear capability)
- Scratchpad memory bank (256\* 32-bit)

## 7.2 System Control Module Environment

The SCM allows the setting of external system DMA (sDMA) request pin sensitivity and controls the multiplexing of device internal modules signals routed to external pins for hardware debug purposes. The SCM also integrates the decoding logic of sys\_boot[5:0].

Figure 7-2 shows an overview of the SCM environment.

Figure 7-2. System Control Module Environment Overview

108-002

The seven sys\_ndmareq[6:0] pins are optional external direct memory access (DMA) requests that can be managed directly by the sDMA controller. The SCM can configure these requests to either level sensitive (active low) or edge sensitive (falling edge) through the correct setting of the SENSNDMAREQN bit (where N is between 0 and 6) in the CONTROL.CONTROL\_DEVCONF0 and CONTROL.CONTROL\_DEVCONF1 registers.

The sys\_boot[5:0] pins are read-accessible in a status register (SYSBOOT field CONTROL.CONTROL\_STATUS[5:0]) following a power-on reset. The SCM does not use sys\_boot[6].

With the correct pad configuration, the SCM maps the hw\_dbg[17:0] pins at the device boundary to observe hardware debug signals from device modules. The internal observable signals are PRCM signals, DMA requests, and interrupts.

## 7.2.1 Functional Interfaces

### 7.2.1.1 Basic System Control Module Pins

Figure 7-3 shows the SCM functional interface configured to observe device module debug signals.

**Figure 7-3. System Control Module Interface Signals**

108-003

### 7.2.1.2 System Control Module Interface Description

Table 7-1 lists the SCM input and output configured to observe device module debug signals.

**Table 7-1. SCM I/O Description**

Signal Name	I/O <sup>(1)</sup>	Description	Reset Value
hw_dbg[17:0]	O	Debug signals 0 to 17	N/A
sys_boot[8:0]	I	Boot configuration mode bits 0 to 8	Unknown

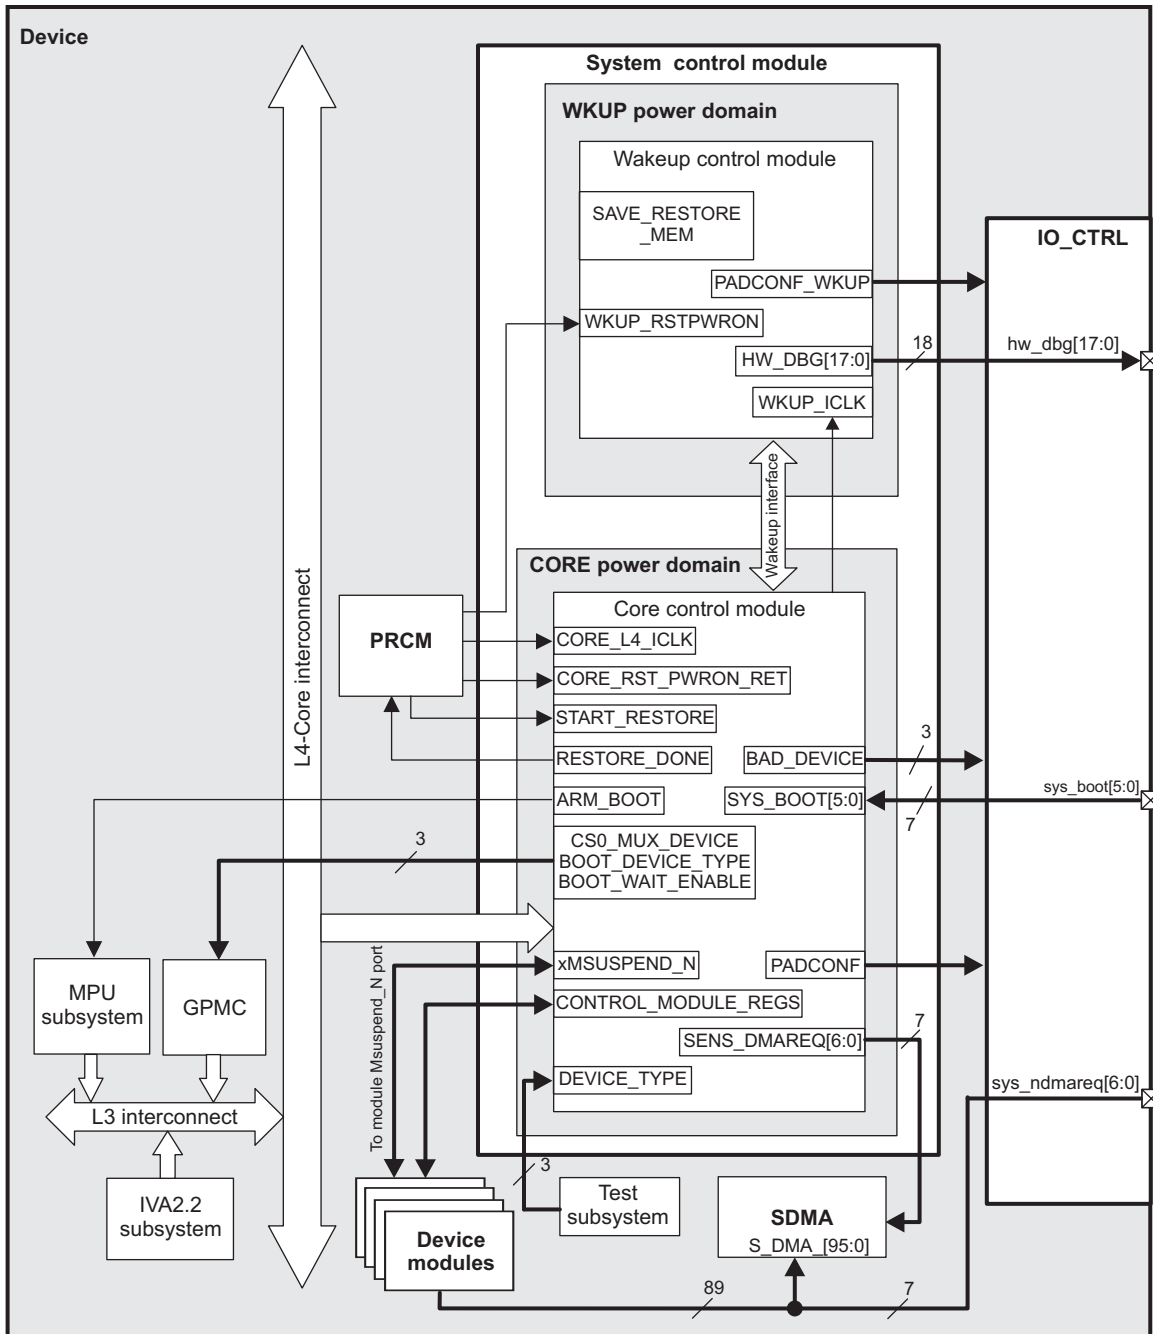

<sup>(1)</sup> I = Input, O = Output

### 7.3 System Control Module Integration

This section describes the integration of the SCM within the device.

Figure 7-4 shows the SCM integration in the device.

Figure 7-4. System Control Module Integration

108-004

The SCM is split into two blocks: the core control module in the CORE power domain, and the wake-up control module in the WKUP power domain. The wake-up control module contains the save-and-restore memory, some observability multiplexing, pad configurations, and security registers. For further information on the wake-up control module, see [Section 7.4.3, Wake-up Control Module](#).

The software sets the configuration registers to the desired values depending on the configuration of the requested device. Static device configuration registers can be set by the software at any time and are effective immediately.

The SCM is connected on the L4-Core interconnect. The power, reset, and clock management (PRCM) module provides the module interface clock (CORE\_L4\_ICLK) and the power-on reset signal. The PRCM generates one global reset per power domain (CORE\_RST\_PWRON\_RET for the CORE power domain and WKUP\_RSTPWRON for the WKUP power domain). The SCM does not respond to a warm reset or to an L4 reset.

### 7.3.1 Clocking, Reset, and Power-Management Scheme

#### 7.3.1.1 Clock

The main sequential logic within the SCM is accessible in a register file through the L4-Core. The only clock provided to the SCM is the interface clock, CORE\_L4\_ICLK. This clock comes from the PRCM module and is controlled by the EN\_SCMCTRL bit PRCM.CM\_ICLKEN1\_CORE[6] (0 = disables the clock, 1 = enables the clock) and the AUTO\_SCMCTRL bit PRCM.CM\_AUTOIDLE1\_CORE[6] (enables/disables automatic control of the interface clock).

The wake-up control module is configured through the L4-Core interface of the core control module and is accessed from the core control module through a dedicated interface. This interface uses the L4-Core interface clock (CORE\_L4\_ICLK) divided by 4 or 2 according to the WKUPCTRLCLOCKDIV bit CONTROL.CONTROL\_PADCONF\_OFF[2]. Only this wake-up interface clock (WKUP\_ICLK) is propagated to the wake-up control module.

For further information, see the *Power, Reset, and Clock Management* chapter.

#### 7.3.1.2 Resets

The SCM responds only to the internal power-on reset and to the device type (secure, emulator, general-purpose, test, or bad). The SOFTRESET bit CONTROL.CONTROL\_SYSCONFIG[1] has no effect; the SCM is not affected by a warm reset.

The internal power-on reset is not a direct image of the power-on reset input pin (SYS\_NRESPWRON). The PRCM module generates an internal power-on reset signal per power domain and activates the internal power-on reset when the eFuse-related settings (such as the device type) are initialized. The core control module of the CORE power domain responds to the CORE power-on reset (CORE\_RST\_PWRON\_RET). The wake-up control module of the WKUP power domain responds to the power-on reset (WKUP\_RSTPWRON).

---

**NOTE:** References in the TRM to the power-on reset refer to the internal power-on reset as seen by the SCM.

On emulator devices, the debugger can also control the internal power-on reset signal through the JTAG interface.

---

For further information, see the *Power, Reset, and Clock Management* chapter.

#### 7.3.1.3 Power Domain

The SCM is split into two blocks: the core control module, which is attached to the CORE power domain and can be in either active, retention, or off state, and the wake-up control module, which belongs to the WKUP power domain.

---

**NOTE:** The System Control Module is fully built with retention Flip-Flop.

---

For further information, see the *Power, Reset, and Clock Management* chapter.

### 7.3.1.4 Power Management

#### 7.3.1.4.1 System Power Management

The PRCM module can require the SCM to be idled to save power. The SCM enters idle mode through the IDLEMODE field CONTROL.CONTROL\_SYSCONFIG[4:3].

The PRCM module requests idle mode, and the SCM always accepts an idle command. Idle mode can be configured to either force-idle or smart-idle mode.

When the SCM is in force-idle mode (IDLEMODE bits CONTROL.CONTROL\_SYSCONFIG[4:3] = 0b00) and it receives an idle request from the PRCM module (PRCM.CM\_ICLKEN1\_CORE[6] set to 0 or PRCM.CM\_AUTOIDLE1\_CORE[6] set to 1 and the L4-Core interface clock idle transitions), the SCM waits unconditionally for active system clock gating by the PRCM module. Active system clock gating occurs only when all peripherals supplied by the same L4-Core interface clock domain are also ready for idle.

In smart-idle mode (IDLEMODE bits CONTROL.CONTROL\_SYSCONFIG[4:3] = 0b10), an idle command is accepted only when the save mechanism completes.

In idle mode (when the PRCM module has gated the interface clock), the SCM is not active and the interface clock paths are gated.

---

**NOTE:** The ST\_SCMCTRL bit PRCM.CM\_IDLEST1\_CORE[6] (0b0 = active, 0b1 = idle) can check the SCM idle state.

The SCM idle mode is a function of the EN\_SCMCTRL bit PRCM.CM\_ICLKEN1\_CORE[6] configuration and can be controlled automatically with hardware, depending on the AUTO\_SCMCTRL bit PRCM.CM\_AUTOIDLE1\_CORE[6] configuration.

---

#### 7.3.1.4.2 Module Power Saving

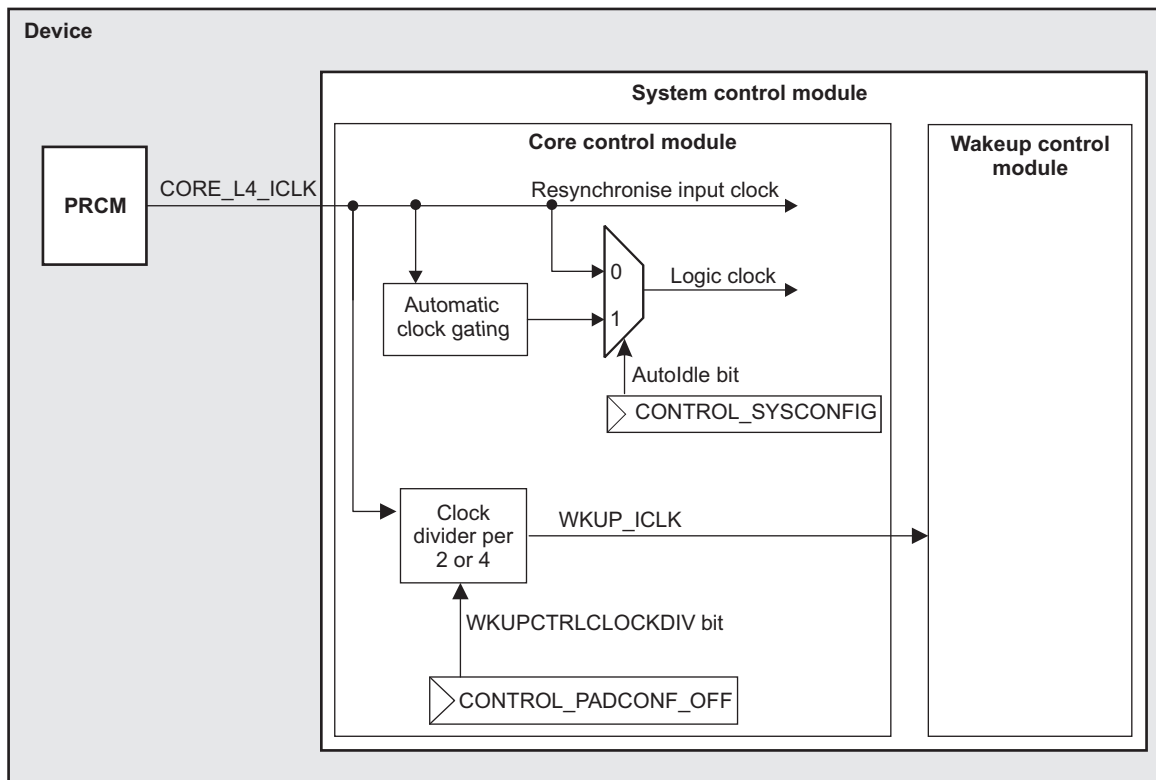

An internal interface clock-gating feature provides SCM local power management. The clock for the logic within the module can be gated when there is no access to the module according to the AUTOIDLE bit CONTROL.CONTROL\_SYSCONFIG[0]. Otherwise, this logic is free-running on the interface clock CORE\_L4\_ICLK.

The L4-Core interface clock (CORE\_L4\_ICLK) is also used to synchronize and resample module inputs. The clock for those functions must always be free-running. Therefore, it is not gated.

The wake-up control module is clocked only by a local wake-up interface clock from the core control module. The wake-up interface clock (WKUP\_ICLK) uses the L4-Core interface clock (CORE\_L4\_ICLK) divided by 4 or 2 to reduce power consumption according to the WKUPCTRLCLOCKDIV bit CONTROL.CONTROL\_PADCONF\_OFF[2] (0 = divided by 4, 1 = divided by 2).

Figure 7-5 shows the SCM internal clock implementation.

Figure 7-5. Internal Clock Implementation

108-005

### 7.3.2 Hardware Requests

The SCM does not generate interrupt or wake-up requests.

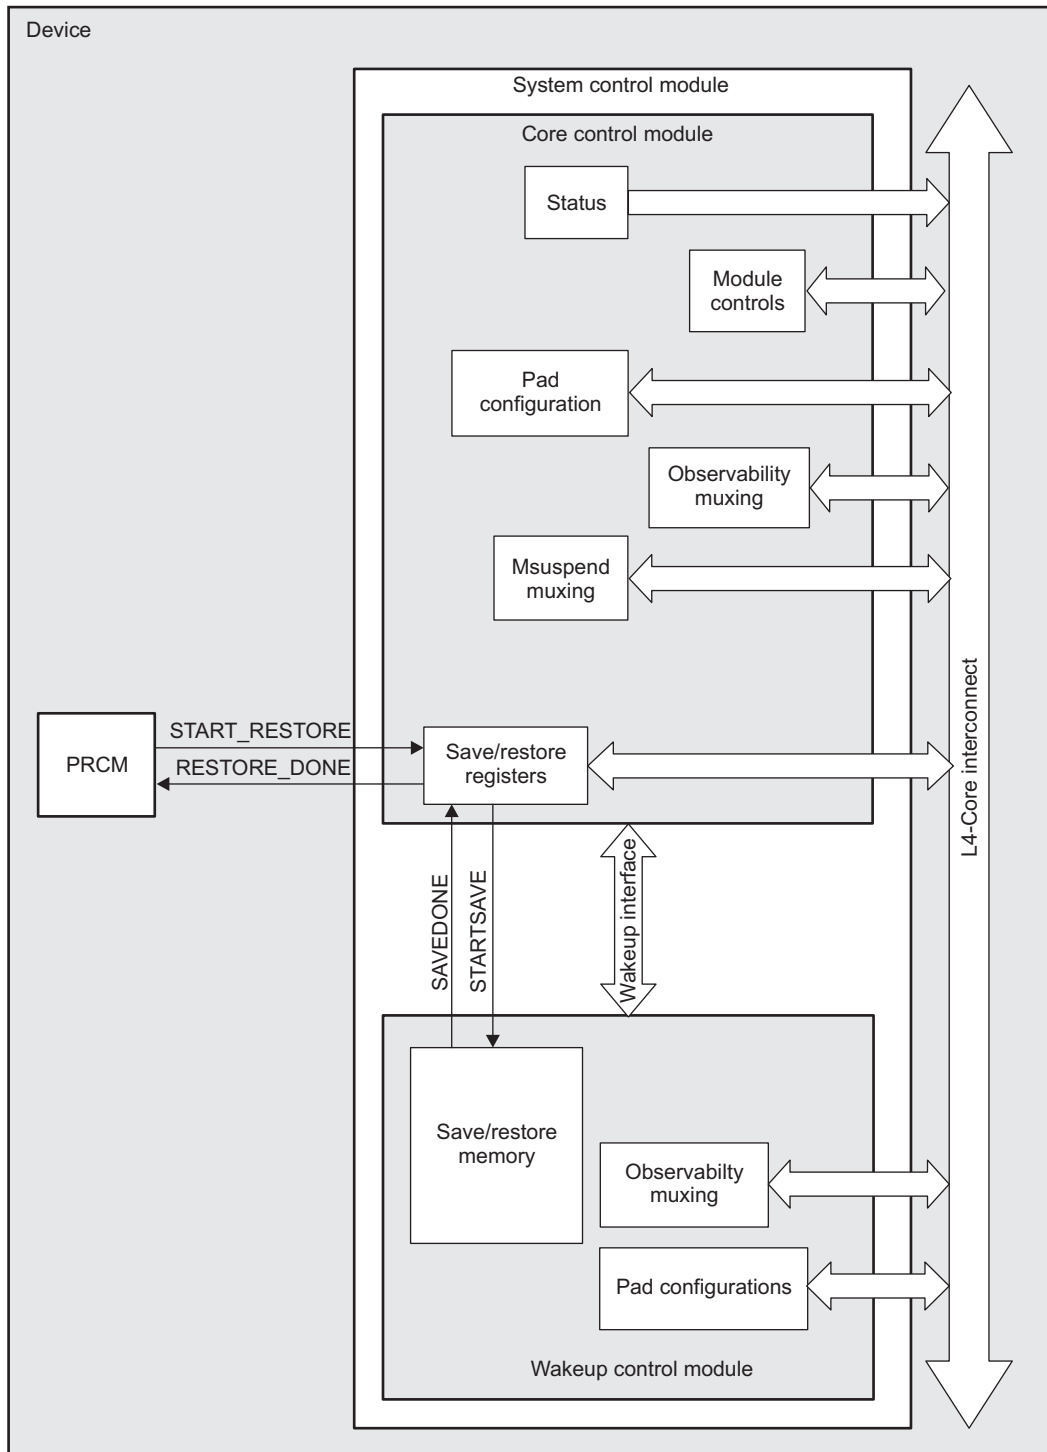

## 7.4 System Control Module Functional Description

### 7.4.1 Block Diagram

The SCM controls various device modules settings through register configuration and internal signals. It also controls the pad configuration and multiplexing and the routing of internal signals (such as PRCM signals or DMA requests) to observable pins for debug.

Figure 7-6 shows the SCM block diagram.

Figure 7-6. System Control Module Block Diagram

scm-006

The following sections describe the functionality of the SCM registers.

### 7.4.2 System Control Module Initialization

The SCM responds only to the internal power-on reset and to the device type. At power-on, reset values for the registers define the safe state for the device. In the initialization mode, only modules used at boot time are associated with the pads. Other module inputs are internally tied, and outputs pads are turned off each time the feature is available.

For the pad configuration, pull-up/pull-down fields are set according to the device pin list. For further information, see the pin list tables in your device-specific data manual.

The device type (for example, emulator, secure, general-purpose) affects the reset values and access rights for some emulation and security-related configuration bits (see [Section 7.6, SCM Registers](#)).

General-purpose devices (that is, those with no secure mode available) include features that are inaccessible or unavailable. These inaccessible registers define the default or fixed device configuration or behavior.

This technical reference manual focuses only on GP devices. To determine if a HS version of your device is available and for more information on HS devices, please refer to your device-specific data manual.

### 7.4.3 Wake-Up Control Module

The wake-up control module in the SCM belongs to the WKUP power domain. It contains a 1 K-byte memory which is used to save the pad configuration registers in the core control module before switching to off mode. Pad configuration registers driving the I/O pad control in the WKUP power domain are also instantiated in the wake-up control module. In this module, there is also a subset of observability multiplexing registers dedicated to PRCM observable signals and security registers (CONTROL.CONTROL\_SEC\_TAP and CONTROL.CONTROL\_SEC\_EMU).

The wake-up control module is configured through the L4-Core interface in the core control module and is accessed from the core control module through a dedicated interface. This interface between the core control module and the wake-up control module uses the CORE\_L4\_ICLK clock divided by 4 or 2 to reduce power consumption in the WKUP power domain.

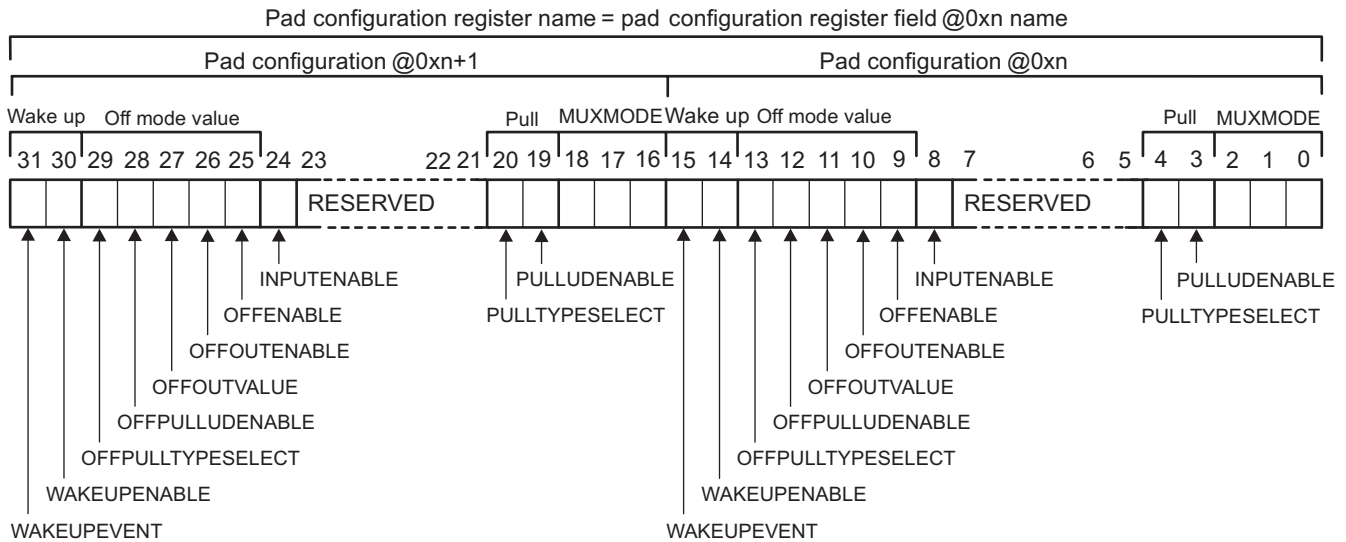

### 7.4.4 Pad Functional Multiplexing and Configuration

After power-on reset, the software sets the pad functional multiplexing and configuration registers to the requested device pad configurations. Data written in these registers command directly the multiplexing of the pad configuration logic.

Each pin is configurable by software using its associated pad configuration register field, which is 16 bits wide (see [Figure 7-7](#)).

**Figure 7-7. Pad Configuration Register Functionality**

scm-008

One pad configuration register field is available for each pin. Each 32-bit pad configuration register is grouped into two 16-bit pad configuration register fields. One pad configuration register provides control for two different pins.

Some pad configuration registers control the configuration of pads in the CORE power domain. These registers are instantiated in the CORE power domain of the SCM (core control module, physical addresses 0x4800 2030 to 0x4800 2260). Pad configuration registers also control the configuration of pads in the WKUP power domain. These registers are instantiated in the WKUP power domain of the SCM (wake-up control module, physical addresses 0x4800 2A00 to 0x4800 2A4C).

Write access to these registers can be restricted to secure privilege mode only through the PADCONFACCDISABLE bit CONTROL.CONTROL\_SEC\_CTRL[3].

**NOTE:** These registers can be accessed using 8-, 16-, and 32-bit operations.

The functional bits of a pad configuration register field are divided into the following five fields:

- MUXMODE (3 bits) defines the multiplexing mode applied to the pin. A mode corresponds to the selection of the functionality mapped on the pin with six (0 to 5) possible functional modes for each pin.
- PULL (2 bits) for combinational pull-up/pull-down configuration:
  - PULLTYPESELECT: Pull-up/pull-down selection for the pin.
  - PULLUDENABLE: Pull-up/pull-down enable for the pin.
- INPUTENABLE (1 bit) drives an input enable signal to the I/O CTRL.
  - INPUTENABLE = 0: Input Disable. Pin is configured in output only mode.
  - INPUTENABLE = 1: Input Enable. Pin is configured in bi-directional mode.
- Off mode values (5 bits) override the pin state when the OFFENABLE bit in the CONTROL\_PADCONF\_X register is set and off mode is active. This feature allows having separate configurations for the pins when in off mode:
  - OFFENABLE: Off mode pin state override control. Set to 1 to enable the feature and to 0 to disable it.
  - OFFFOUTENABLE: Off mode output enable value. Set to 0 to enable the feature and set to 1 to disable the feature.
  - OFFFOUTVALUE: Off mode output value.
  - OFFPULLUDENABLE: Off mode pull-up/pull-down enable
  - OFFPULLTYPESELECT: Off mode pull-up/pull-down selection

**NOTE:** The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

- Wake-up bits (2 bits):
  - WAKEUPENABLE: Enable wake-up detection on input. It is also the OFF mode input enable value.
  - WAKEUPEVENT: Wake-up event status for the pin.

**CAUTION**

The software has in charge to configure the OFF mode pads configuration. It must be careful on the Input/Output capability enabled for each pin.

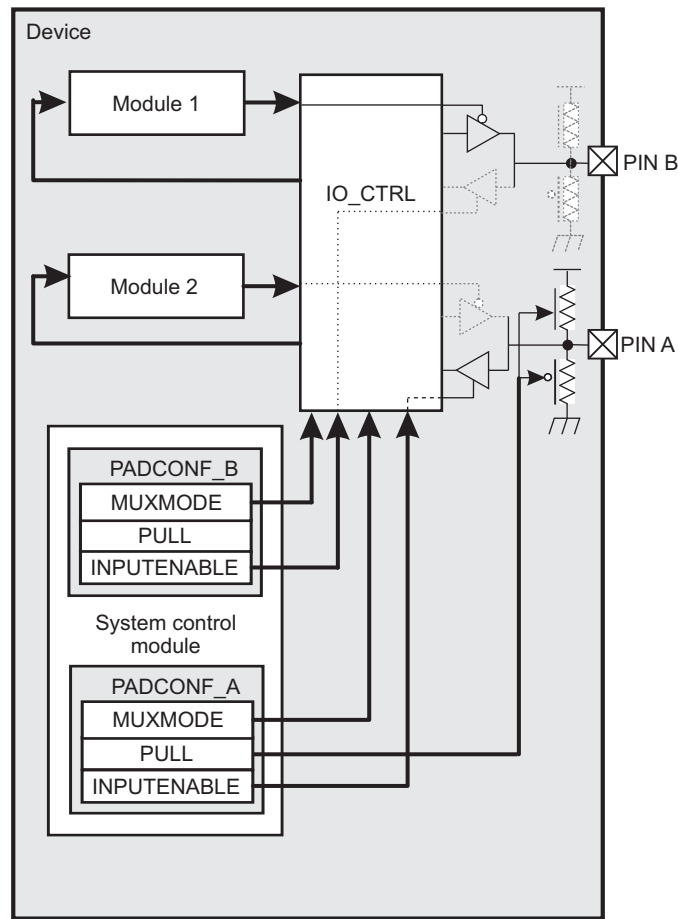

Table 7-2 lists the bit directions of the CONTROL\_PADCONF\_x registers.

**Table 7-2. Bit Directions for CONTROL\_PADCONF\_x Registers**

CONTROL_PADCONF_x Bit	Bit Direction	
	0	1
PULLUDENABLE	Not activated	Activated
PULLTYPESELECT	Pulldown	Pullup
INPUTENABLE	Input enable signal inactive	Input enable signal active
OFFENABLE	Off mode values are invalid.	Off mode values are valid.
OFFOUTENABLE	Output	Input
OFFOUTVALUE	Low	High
OFFPULLUDENABLE	Not activated	Activated
OFFPULLTYPESELECT	Pulldown	Pullup
WAKEUPENABLE	Disable I/O wake-up function.	Enable I/O wake-up function.
WAKEUPEVENT	Wake-up event not detected	Detect wake-up event.

Figure 7-8 shows the pad configuration functionality when off mode is inactive. For further information on off mode, see Section 7.4.4.4, *Off Mode*.

**Figure 7-8. Pad Configuration Diagram**

scm-009

#### 7.4.4.1 Mode Selection

Table 7-3 lists the multiplexing modes and settings.

**Table 7-3. Mode Selection**

MUXMODE	Selected Mode
0b000	Primary mode = Mode 0
0b001	Mode 1
0b010	Mode 2
0b011	Mode 3
0b100	Mode 4
0b101	Mode 5
0b110	Mode 6
0b111	Safe mode = Mode 7

The MUXMODE field in the CONTROL\_PADCONF\_X register defines the multiplexing mode applied to the pad. Modes are referred to by their decimal (from 0 to 7) or binary (from 0b000 to 0b111) representation. Functional modes are defined from 0b000 to 0b101; mode 0b111 is referred to as the safe mode.

For most pads, the reset value for the MUXMODE field in the CONTROL\_PADCONF\_X register is 0b111. The exceptions are pads to be used at boot time to transfer data from selected peripherals to the external flash memory.

Mode 0 is the primary mode. When mode 0 is set, the function mapped to the pin to the name of the pin.

Mode 1 to mode 6 are possible modes for alternate functions. On each pin, some modes are used effectively for alternate functions, while other modes are unused and correspond to no functional configuration.

The safe mode avoids any risk of electrical contention by configuring the pin as an input with no functional interface mapped to it. The safe mode is used mainly as the default mode for all pins containing no mandatory interface at the release of power-on reset.

For more information about the configurable mode on each pin, see [Table 7-5](#) through [Table 7-7](#) .

#### 7.4.4.2 Pull Selection

Whichever pull value is configured, pulls are automatically disabled when a pin is configured as an output (see [Table 7-4](#)).

**Table 7-4. Pull Selection**

PULL		Pin Behavior
PULLTYPESELECT	PULLUDENABLE	
0b0	0b0	Pull-down selected but not activated
0b0	0b1	Pull-down selected and activated if pin is NOT configured as OUTPUT
0b1	0b0	Pull-up selected but not activated
0b1	0b1	Pull-up selected and activated if pin is NOT configured as OUTPUT

For more information on the pull available on each pin, see [Table 7-5](#) through [Table 7-7](#) .

### 7.4.4.3 Pad Multiplexing Register Fields

Table 7-5 through Table 7-7 provide for each pad configuration register field the address offset and the associated signal name for each multiplexing mode (as set by bit field MUXMODE). Mode 0 is always defined. Modes with no signal name are undefined for the given pad.

**NOTE:**

- Pad configuration registers are split into three types, which correspond to the following three tables:
  - Table 7-5 lists the pad configuration registers instantiated in the CORE power domain that drive the pads in the CORE power domain.
  - Table 7-6 lists the pad configuration registers instantiated in the CORE power domain that drive the D2D pads. These pads are available in stacked mode only.
  - Table 7-7 lists the pad configuration registers instantiated in the WKUP power domain that drive the pads in the WKUP power domain.
- In Table 7-5 through Table 7-7 an empty cell indicates that the mode or pull is not available for this pin.

**Table 7-5. Core Control Module Pad Configuration Register Field**

Register Name	Physical Address	Mode 0	Mode 1	Mode 2	Mode 3	Mode 4	Mode 5	Mode 6	Mode 7
CONTROL_PADCONF_SDRC_D0[15:0]	0x4800 2030	sdrc_d0							
CONTROL_PADCONF_SDRC_D0[31:16]	0x4800 2030	sdrc_d1							
CONTROL_PADCONF_SDRC_D2[15:0]	0x4800 2034	sdrc_d2							
CONTROL_PADCONF_SDRC_D2[31:16]	0x4800 2034	sdrc_d3							
CONTROL_PADCONF_SDRC_D4[15:0]	0x4800 2038	sdrc_d4							
CONTROL_PADCONF_SDRC_D4[31:16]	0x4800 2038	sdrc_d5							
CONTROL_PADCONF_SDRC_D6[15:0]	0x4800 203C	sdrc_d6							
CONTROL_PADCONF_SDRC_D6[31:16]	0x4800 203C	sdrc_d7							
CONTROL_PADCONF_SDRC_D8[15:0]	0x4800 2040	sdrc_d8							
CONTROL_PADCONF_SDRC_D8[31:16]	0x4800 2040	sdrc_d9

CONTROL_PADCONF_JTAG_EMU0[31:16]	0x4800 2A24	jtag_emu1				gpio_31			safe_mode
CONTROL_PADCONF_SAD2D_SWAKEUP[15:0] <sup>(1)</sup>	0x4800 2A4C	sad2d_swakeup							
CONTROL_PADCONF_SAD2D_SWAKEUP[31:16]	0x4800 2A4C	jtag_rtck							
CONTROL_PADCONF_JTAG_TDO[15:0]	0x4800 2A50	jtag_tdo							

<sup>(1)</sup> The D2D\_swakeup pad is available in stacked mode only.

**NOTE:** Pad names are signal names available in mode 0.

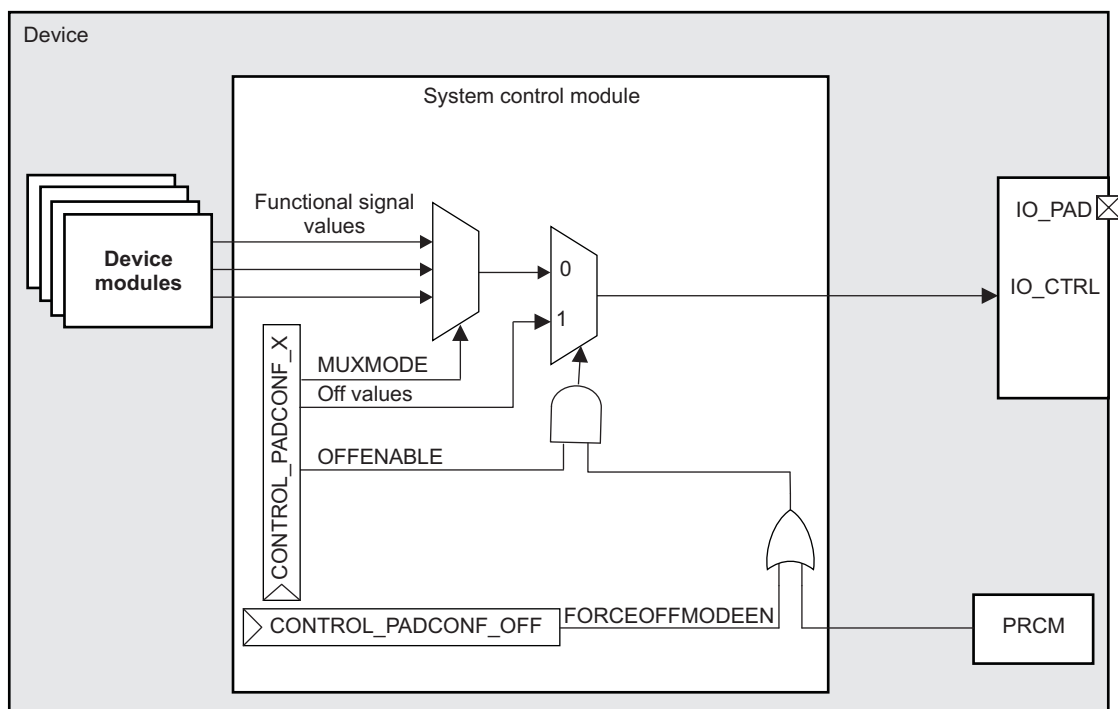

For more information on the pad default states, please refer to your device-specific data manual.

#### 7.4.4.4 System Off Mode

When off mode is active ( $PAD\_SYS\_OFF\_MODE = 0b1$  from PRCM or  $FORCEOFFMODEENABLE$  bit  $CONTROL\_CONTROL\_PADCONF\_OFF[0] = 0b1$ ), the off mode values field in  $CONTROL\_PADCONF\_X$  overrides the pad state when  $OFFENABLE$  bit in the  $CONTROL\_PADCONF\_X$  register is set.

Figure 7-9 shows the off mode pad control.

**Figure 7-9. System Off Mode Pad Control Overview**

scm-010

If off mode is active and the  $OFFENABLE$  bit is set to disable, the pad keeps the AND value of the configuration (input/output, PU/PD) it had before going into off mode:

- For an input, the pad is isolated and the pull remains active.
- For an output, the value is latched before going into off mode, to drive the same value in off mode.

For further information on the OFF mode, see the *Power, Reset and Clock Management* chapter.

For further information on the preliminary settings that must be done before to perform OFF  $\leftrightarrow$  ON transitions, refer to [Section 7.5.3](#) of this chapter.

##### 7.4.4.4.1 Save-and-Restore Mechanism

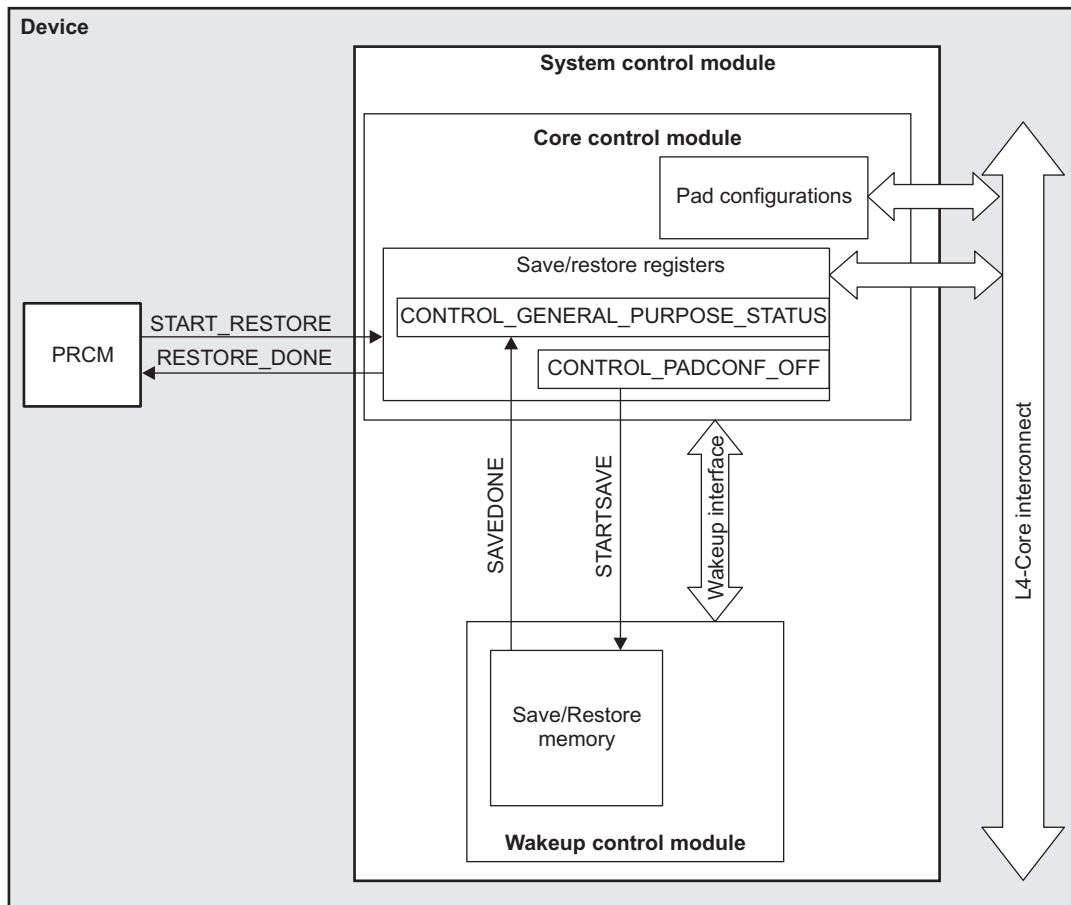

Before going to OFF mode there is a context saving of the device. The save-and-restore mechanism saves the pad configuration registers (in the CORE power domain) in a WKUP power domain memory (physical addresses 0x4800 2600 to 0x4800 29FC) before going to off mode, and restores those registers when returning from off mode. This mechanism uses the dedicated wake-up interface between the core control module and the wake-up control module.

The save mechanism in the pad configuration registers is activated by setting the STARTSAVE bit CONTROL.CONTROL\_PADCONF\_OFF[1]. When all pad configuration registers have been saved to the wake-up memory, the status SAVEDONE bit CONTROL.CONTROL\_GENERAL\_PURPOSE\_STATUS[0] is set. In smart-idle mode, the idleAck is returned when the save process is complete.

When returning from off mode, the registers are restored after the PRCM module asserts the START\_RESTORE signal. The SCM returns a RESTORE\_DONE signal to the PRCM module when the restore process completes.

Figure 7-10 shows an overview of the save-and-restore mechanism in off mode.

**Figure 7-10. Save-and-Restore Mechanism Overview**

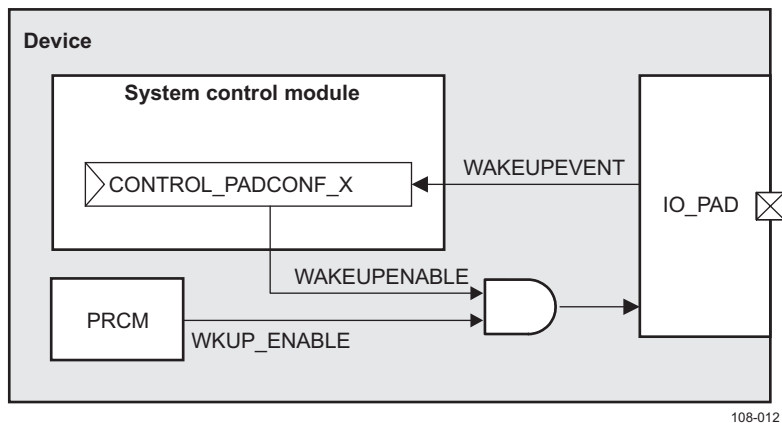

108-011

#### 7.4.4.4.2 Wake-up Event Detection

In off mode, wake-up event detection can also be enabled on an input pad. The pad wake-up event is latched in the WAKEUPEVENT bit CONTROL. CONTROL\_PADCONF\_X.

The OFF mode IO pads wake-up scheme is enabled by setting the EN\_IO bit PRCM.PM \_WKEN\_WKUP[8]. The wake-up scheme status is transmitted by the WKUP\_ENABLE signal. The wake-up event detection capability of each IO pad of the device is individually enabled/disabled by writing WAKEUPENABLE bit CONTROL. CONTROL\_PADCONF\_X.

**Figure 7-11. Wake-up Event Detection Overview**

For further information on the Wake-up sequences, see the *Power, Reset and Clock Management* chapter.

**NOTE:** When wake-up detection is enabled for a pad, the pad must be configured as input to avoid contention between the OMAP output buffer and an external driver. If this pin is already configured as an input in active mode, hardware automatically retains the same input state; no software action is required.

If this pin is configured as an output in active mode, the OFF override function must be enabled to set the pin as an input during off mode: in the CONTROL.CONTROL\_PADCONF register, set OFFENABLE to 0x1 to enable the OFF override function and set OFFOUTENABLE to 0x1 to switch this pin to input mode.

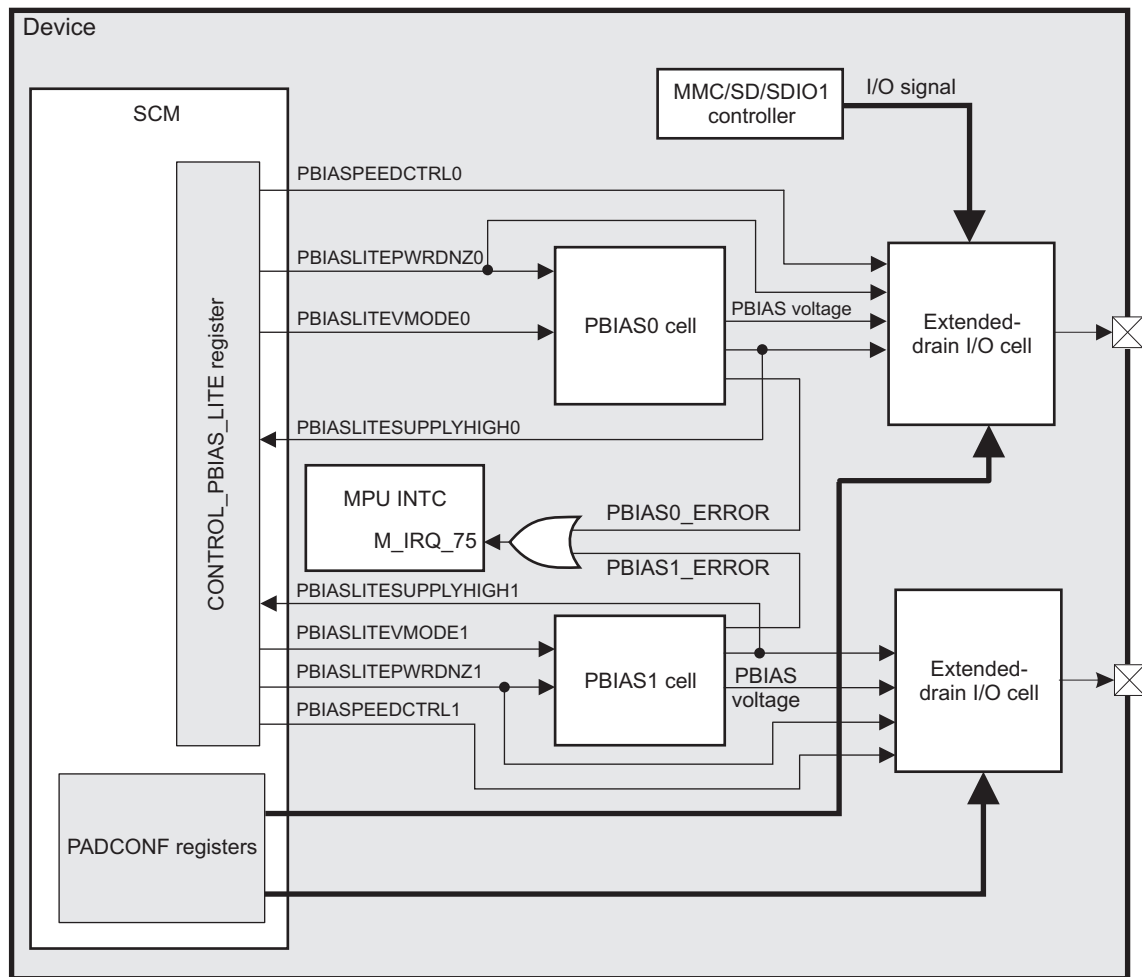

### 7.4.5 Extended-Drain I/O Pin and PBIAS Cell

The device mainly supports 1.8-V I/O voltage on its interfaces, with the exception of MMC/SD/SDIO1 interfaces, which support both 1.8-V and 3.0-V voltages via internal PBIAS generation and extended-drain I/Os.

The need for embedded extended-drain I/Os on MMC/SD/SDIO1 interfaces imposes the use of embedded PBIAS cells to provide 1.8-V or 3.0-V reference voltage. The PBIAS cells and the extended-drain I/Os are software-controlled by bits located in the CONTROL.CONTROL\_PBIAS\_LITE register of the SCM. See [Section 7.6.4, Register Descriptions](#), for the description of this register.

[Figure 7-12](#) shows the functional block diagram between the PBIAS cells and the extended I/O cells.

**Figure 7-12. Functional Block Diagram**

SCM-014

Table 7-8 describes the CONTROL.CONTROL\_PBIAS\_LITE bit control for the PBIAS and the extended-drain I/O cells.

**Table 7-8. PBIAS Cell and Extended-Drain I/O Pin CONTROL\_PBIAS\_LITE Bit Control**

Control Signal for MMC/SD/SDIO1	Control Signal for PBIAS1	Description
PBIASLITEPWRDNZ0	PBIASLITEPWRDNZ1	Protects the I/O cell when the VDDS_MMC1 (for PBIAS0) or VDDS_SIM (for PBIAS1) voltage is not stable. Software must keep this signal to 0b0 when the is ramping. When this bit is at 0, the PAD is floating.
PBIASLITEVMODE0	PBIASLITEVMODE1	Controls the VDDS_MMC1 (for PBIAS0) or VDDS_SIM (for PBIAS1) voltage level. The default state of this bit is HIGH, indicating that the voltage level is 3.0V.
PBIASLITESUPPLYHIGH0	PBIASLITESUPPLYHIGH1	Describes whether the VDDS_MMC1 (for PBIAS0) or VDDS_SIM (for PBIAS1) supply is 3.0 V or 1.8 V
PBIASSPEEDCTRL0	PBIASSPEEDCTRL1	Controls I/O cell speed
PBIASLITEVMODEERROR	PBIASLITEVMODEERROR1	Indicates whether the software-programmed VMODE level matches the SUPPLY_HI output signal
PBIAS0_ERROR	PBIAS1_ERROR	Determines whether the software-programmed xPBIASLITEVMODE level matches the xPBIASLITESUPPLYHIGH. This signal is generated only when xPBIASLITEVMODEEN is HIGH.

Table 7-9 lists the power supplies for the PBIAS and the extended-drain I/O cells.

**Table 7-9. Power Supplies**

Name	Description
VDD (VDD2 power pin)	Core voltage supply
VDDS_MMC1 or VDDS_SIM power pin	I/O supply voltage nominal 1.8 V/ 3.0 V
VSUP_18	1.8-V supply for the input buffer

#### 7.4.5.1 PBIAS Cell

The PBIAS cell provides a bias for the extended-drain I/O cell used with high voltage for MMC/SD/SDIO1 interfaces. The PBIAS cell provides a voltage reference (PBIAS voltage) for biasing the extended-drain in the MMC/SD/SDIO1 I/O cell. Besides generating the bias voltage, the cell can detect the supply voltage (VDDS\_MMC1 or VDDS\_SIM) value (1.8 V or 3.0 V) and update, with its status, the PBIASLITESUPPLYHIGH0 or PBIASLITESUPPLYHIGH1 bit.

#### CAUTION

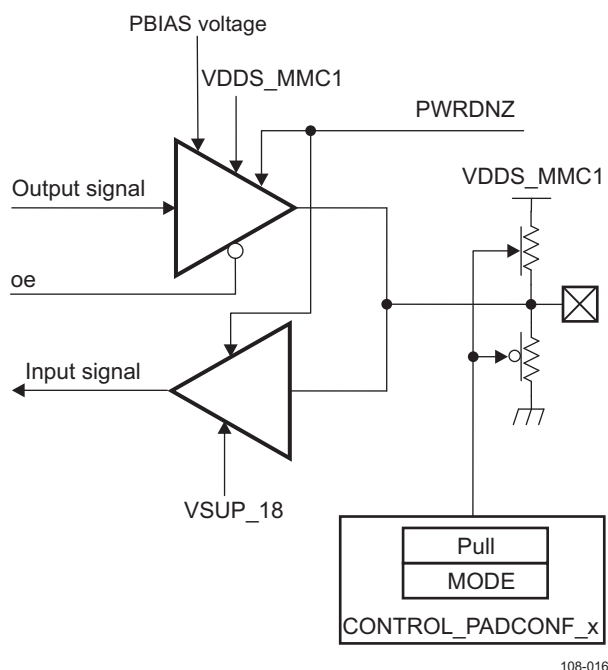

The PBIAS cell lets the MMC/SD/SDIO1 peripheral support 1.8-V and 3.0-V voltages. The PBIAS cell is not a part of the MMC/SD/SDIO1 peripheral, but a part of the device I/O to which the MMC/SD/SDIO1 peripheral is internally connected. These device I/Os are not exclusive to the MMC/SD/SDIO1 peripheral; through I/O multiplexing they can be connected to other internal signals. It is necessary to configure the PBIAS to enable the I/Os, regardless of how I/O multiplexing is configured for these device I/Os. In other words, independently of which signal is internally connected to a device I/O powered by VDDS\_MMC1 or VDDS\_SIM, the PBIAS must be configured.

#### 7.4.5.2 Extended-Drain I/O

On the device, the following extended-drain I/Os are used by I/Os from the MMC/SD/SDIO1 and USIM modules:

- MMC/SD/SDIO1 module: mmc1\_clk, mmc1\_cmd, and mmc1\_dati (where i = 0 to 7).
- USIM module: sim\_io, sim\_clk, sim\_pwrctrl, sim\_rst.

Figure 7-13 describes the extended-drain I/O cell.

**Figure 7-13. Extended-Drain I/O**

The extended-drain I/O cell has the following I/O signals:

- Output signal, input signal, and oe, which comes from the MMC/SD/SDIO1 or USIM module with the correct MODE field CONTROL. [CONTROL\\_PADCONF\\_X](#) configuration.

**NOTE:** MMC/SD/SDIO1 or USIM extended-drain I/Os are muxed I/Os with mode and pull-up/pull-down configurations programmable in the SCM.

- The PBIAS voltage is a voltage reference for biasing the extended-drain in the MMC/SD/SDIO1 or USIM I/O cell.
- The PBIASLITEPWRDNZ0 or PBIASLITEPWRDNZ1 bits are used to protect the I/O cell when the VDDS voltage is not stable.

#### CAUTION

Software must keep this signal to 0b0 whenever the VDDS signal is ramping. When PBIASLITEPWRDNZ0 or PBIASLITEPWRDNZ1 is 0, the PAD is floating (the PAD may not reflect the state of the output signal, and the input signal may not reflect the state of the PAD).

- The PBIASPEEDCTRL0 or PBIASPEEDCTRL1 bits control the speed of I/O cells and can be used to reduce dynamic current if fast rise/fall times are not required.
- The PBIASLITESUPPLYHIGH0 or PBIASLITESUPPLYHIGH1 bits are status bits on the VDDS value and is used to inform the cell on the value of VDDS signal.

For further information on the software configurations of the extended-drain I/O and PBIAS cell, see [Section 7.5.2, Extended-Drain I/Os and PBIAS Cell Programming Guide](#).

## 7.4.6 Functional Register Description

### 7.4.6.1 Static Device Configuration Registers

Table 7-10 describes the static device configuration registers.

**Table 7-10. Static Device Configuration Registers**

Physical Address	Register Name	Description	Access
0x4800 2274	CONTROL_DEVCONF0	Module dedicated configurations	R/W
0x4800 22D8	CONTROL_DEVCONF1	Module dedicated configurations	R/W

These registers allow the static configuration of device modules such as USB, McBSP, and I<sup>2</sup>C. For example, they allow selecting external or internal clocks for McBSP modules.

### 7.4.6.2 Control CSIRXFE Register

Table 7-11 describes the CONTROL.CONTROL\_CSIRXFE register, which controls some CSIRXFE analog cell settings. The CSIRXFE analog cell is used in the interface between a digital camera module and a mobile engine phone.

**Table 7-11. Control CSIRXFE Register**

Physical Address	Register Name	Description	Access
0x4800 22DC	CONTROL_CSIRXFE	Controls settings for CSIb interface pins	R/W

### 7.4.6.3 MPU and/or DSP (IVA2.2) MSuspend Configuration Registers

Table 7-12 describes the MPU and/or DSP (IVA2.2) MSuspend configuration registers.

**Table 7-12. MSuspendMux Control Registers**

Physical Address	Register Name	Description	Access
0x4800 2290	CONTROL_MSUSPENDMUX_0	Control the use of MSuspend signals at module level.	R/W
0x4800 2294	CONTROL_MSUSPENDMUX_1		R/W
0x4800 2298	CONTROL_MSUSPENDMUX_2		R/W
0x4800 229C	CONTROL_MSUSPENDMUX_3		R/W
0x4800 22A0	CONTROL_MSUSPENDMUX_4		R/W
0x4800 22A4	CONTROL_MSUSPENDMUX_5		R/W
0x4800 22A8	CONTROL_MSUSPENDMUX_6		R/W

These registers provide an entry for each module that must consider the MSuspend signals from the processors (MPU and/or DSP) . For each module, the sensitivity to the MSuspend signals is defined within five possibilities (coded using 3 bits):

- 0b000: No sensitivity; no MSuspend signal reaches the module.
- 0b001: Sensitivity to the MPU MSuspend signal (the DSP signal is ignored)
- 0b010: Sensitivity to the DSP MSuspend signal (the MPU signal is ignored)
- 0b011: Sensitivity to the logical ORed MPU and DSP MSuspend signals
- 0b100: Sensitivity to the logical ANDed MPU and DSP MSuspend signals
- Other values: No sensitivity; no MSuspend signal reaches the module.

The logic used to combine the MSuspend signals from the processors is implemented within the SCM. MSuspend signals are active low.

### CAUTION

Use care when using combined sensitivity settings (ANDing or ORing DSP and MPU MSuspend signals).

ORing the DSP and MPU MSuspend signals creates a situation where the module is suspended when at least one processor is under debug; therefore, when one processor is halted, stepping within the code of the other one does not change the module suspended state.

Not all modules use the MSUSPEND signal. See the TRM chapter for each module to determine whether the module supports the MSUSPEND signal.

All MSUSPEND signals coming out of the MPU and DSP are resynchronized within the SCM by using the control module interface clock.

#### 7.4.6.4 IVA2.2 Boot Registers

Table 7-13 describes the IVA2.2 boot registers.

**Table 7-13. IVA2.2 Boot Registers**

Physical Address	Register Name	Description	Access
0x4800 2400	CONTROL_IVA2_BOOTADDR	IVA2.2 boot loader address register	R/W
0x4800 2404	CONTROL_IVA2_BOOTMOD	IVA2.2 boot mode register	R/W

The CONTROL.CONTROL\_IVA2\_BOOTADDR register defines the physical address for the IVA2 boot loader and drives the IVA2\_BOOTADDR[21:0] signals out from the control block to the IVA2 subsystem.

The CONTROL.CONTROL\_IVA2\_BOOTMOD register defines the IVA2 boot mode and drives the IVA2\_BOOTMOD[3:0] signals out from the control block to the IVA2.2 subsystem. Based on the value of IVA2\_BOOTMOD[3:0], the ROM boot loader executes different boot modes of IVA2.2.

Table 7-14 lists the IVA2.2 boot modes.

**Table 7-14. IVA2.2 Boot Modes**

IVA2_BOOTMOD[3:0] Value	Meaning
0x0	Direct boot: The ROM loader is not executed. Instead, IVA2.2 directly starts executing the bootstrap at the address contained in the CONTROL_IVA2_BOOTADDR register.
0x1	Idle boot: The boot loader executes the IDLE instruction.
0x2	Wait in self-loop boot: The boot loader puts IVA2.2 in a self-loop.
0x3	User-defined bootstrap mode: The boot loader copies the boot strap into internal memory and branches to it.
0x4	The boot loader executes the default context restore code, which is part of the ROM boot loader.

For further information, see the *IVA2.2 Subsystem* chapter.

#### 7.4.6.5 PBIAS LITE Control Register

Table 7-15 describes the CONTROL.CONTROL\_PBIAS\_LITE register, which controls some settings of PBIAS LITE cells for MMC/SD/SDIO interface.

**Table 7-15. PBIAS Control Register**

Physical Address	Register Name	Description	Access
0x4800 2520	CONTROL_PBIAS_LITE	Control settings for PBIAS0 and PBIAS1 cells	R/W

For further details on the PBIAS cells please refer to [Section 7.4.5, Extended-Drain I/O Pin and PBIAS Cell](#).

### 7.4.6.6 CSI Receiver Control Register

[Table 7-16](#) describes the CONTROL.CONTROL\_CSI register, which controls the CS1b receiver trimming override.

**Table 7-16. CSI Receiver Control Register**

Physical Address	Register Name	Description	Access
0x4800 2530	CONTROL_CSI	CS1b receiver trimming override	R/W

### 7.4.7 Security Registers

The security registers in the SCM allow the configuration of the system-level security of the device. This configuration includes reset values and debug and test properties.

This technical reference manual focuses only on GP devices. Therefore, only the general-purpose features on security registers are explained in this chapter.

To determine if a HS version of your device is available and for more information on HS devices, please refer to your device-specific data manual.

Secure registers have the following characteristics:

- Secure registers can be accessed (read or write) only when the MPU is in secure privilege mode.
- When the MPU is not in secure privilege mode, reads to these registers return 0.
- When the MPU is in secure privilege mode, reads to these registers return the current programmed value.
- All secure registers are reset by the power-on reset, the values of which are device-type dependent.
- Some secure registers are restricted for public or secure privilege accesses by using lock bits. When the lock is high, the registers can be accessed only by secure accesses. When the lock is low, the registers can be accessed by both public and secure transactions.

Some bits also depend on the public or secure privilege mode and the device type configured:

- S: Secure device
- T: Test device
- E: Emulator device
- B: Bad device
- G: General-purpose device

#### 7.4.7.1 Security Control Registers

[Table 7-17](#) describes the security control registers.

**Table 7-17. Security Control Registers**

Physical Address	Register Name	Description	Access	
			Device Type	
			G	S/T/E/B
0x4800 22B0	CONTROL_SEC_CTRL	Security control register	Public and secure (R/OCO <sup>(1)</sup> )	Secure privilege (R/OCO) and public (R)
0x4800 2A64	CONTROL_SEC_EMU	Emulation security control register	Public and secure (R)	Secure privilege (R/OCO) and public (R)
0x4800 2A60	CONTROL_SEC_TAP	Tap controllers security control register	Public and secure (R/OCO)	Secure privilege (R/OCO) and public (R)
0x4800 2A7C	CONTROL_SEC_DAP	Force DAP qualifiers for ease of FW programming	Public and secure (R/W)	Public and secure (R/W)

<sup>(1)</sup> R/OCO: Read/one-change-only

The CONTROL.CONTROL\_SEC\_CTRL and CONTROL.CONTROL\_SEC\_TAP registers are public accessible on G devices, and secure privilege accessible on S/T/E/B devices.

The CONTROL.CONTROL\_SEC\_EMU register can be accessed (read or write) only when the MPU is in secure privilege mode. Otherwise, a read to this register returns 0.

The reset values and write capabilities of these registers differ according to the device type.

The CONTROL.CONTROL\_SEC\_DAP register is accessible on public and secure privilege devices. Accesses to this register are restricted according to the SECDAPWRDISABLE bit CONTROL.CONTROL\_SEC\_DAP[31].

The reset values and write capabilities of this register do not depend on the device type.

Some bits in these registers are one-change-only (OCO):

- Write actions that do not change the bit reset value are not considered.
- The first write action that changes the bit reset value is considered; any subsequent write action is ignored. No more write actions are effective until the next power-on reset.

### 7.4.7.2 Security Status Registers

Table 7-18 lists the status registers.

**Table 7-18. Security Status Registers**

Physical Address	Register Name	Description	Access
0x4800 22E0	CONTROL_SEC_STATUS	Security status register	Public (R) and secure privilege (R/W)
0x4800 22E4	CONTROL_SEC_ERR_STATUS	Security error status register	Public (R) and secure privilege (R/W)
0x4800 22E8	CONTROL_SEC_ERR_STATUS_DEBUG G	Security error status register debug	Public (R) and secure privilege (R/W)

These registers do not depend on the device type.

The CONTROL.CONTROL\_SEC\_STATUS, CONTROL.CONTROL\_SEC\_ERR\_STATUS, and CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG registers can be read in public and secure privilege mode, and can be written only in secure privilege mode.

The individual bits are cleared on a write access (same value written) in secure privilege mode. These bits are also cleared when the L3 and L4 firewall embedded error log registers are cleared. All bits in these registers reflect device internal events related to the device security.

On a specific event (signal rising edge), the corresponding bit is set. On a rising edge, the input signal must stay high for at least two interface clocks periods to be recognized. The software must clear each bit after reviewing the events.

When a security violation occurs, the following bits are set :

- In application mode
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [00] = OCM-ROM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [01] = OCM-RAM security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [02] = GPMC security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [04] = SMS security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [06] = IVA2.2 security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [07] = L4-Core security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [12] = L3 RT security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [15] = D2D security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [16] = L4-Peri security violation
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS [17] = L4-Emu security violation
- In debug mode
  - CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [00] = OCM-ROM security violation

- CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [01] = OCM-RAM security violation
- CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [02] = GPMC security violation
- CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [03] = SMS security violation
- CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [06] = IVA2.2 security violation
- CONTROL.CONTROL\_SEC\_ERR\_STATUS\_DEBUG [12] = L3 RT security violation

For more information, please refer to the *Interconnect* chapter.

### 7.4.7.3 Device Status Registers

Table 7-19 lists the status registers.

**Table 7-19. Device Status Registers**

Physical Address	Register Name	Description	Access
0x4800 22F0	CONTROL_STATUS	Device status register	Public and secure privilege (R)
0x4800 22F4	CONTROL_GENERAL_PURPOSE_STATUS	Status bits reflecting device internal states	Public and secure privilege (R)

These registers do not depend on the device type.

The CONTROL.CONTROL\_STATUS and CONTROL.CONTROL\_GENERAL\_PURPOSE\_STATUS registers are read-only registers and have no access restriction.

**NOTE:** Depending on the DEVICE\_TYPE and sys\_boot[5:0] input signals, the SCM provides the six output signals listed in Table 7-20.

**Table 7-20. System Control Module I/O Signals**

Signal Name	I/O	Width	Description
sys_boot[5:0]	I	6	System boot input 0 to 5, from pad; this is latched at reset.
DEVICE_TYPE	I	3	Device type (from test_sub_system) sampled at reset
BOOT_WAIT_ENABLE	O	1	Dedicated to GPMC controller
ARM_BOOT	O	1	Dedicated to MPU subsystem
BAD_DEVICE	O	3	Used by I/O pads gating logic (I/O core)
CS0_MUX_DEVICE	O	1	Dedicated to GPMC controller
BOOT_DEVICE_SIZE	O	1	Dedicated to GPMC controller
INTERNAL_BOOT	O	1	Internal or external boot selection

- ARM\_BOOT <= (((DeviceType == Emulator) or (DeviceType == Test)) and (sys\_boot[4:0] == 0b111111)):
 

Determines whether it is external boot and authorizes it only for general-purpose and emulation
- BOOT\_WAIT\_ENABLE <= (sys\_boot[5:0] == 0b111111):
 

Allows indicating whether or not the attached memory uses a wait active low
- BAD\_DEVICE <= DeviceType if (DeviceType == Bad)
- CS0\_MUX\_DEVICE <= 1:
 

Allows indicating whether it is multiplexed or nonmultiplexed FLASH
- BOOT\_DEVICE\_SIZE <= 1 (16 bits)
- INTERNAL\_BOOT <= Not ARM\_BOOT:
 

Determines whether or not the attached memory uses a wait active low.

The lower three sys\_boot[4:0] pins allow the selection of the booting sequence of interfaces or devices for ROM code when booting. Sys\_boot[5] switches between memory (0) and peripheral (1) booting.

For further information on the configuration of the sys\_boot pins, see the *Initialization* chapter.

After booting, these pins can be used optionally for other functions. When the pins are reused, the associated sysboot registers are not modified by the new functionality. It is recommended that the output function on the sys\_boot pins be reused.

#### 7.4.7.4 Secure SDRC Registers

[Table 7-21](#) lists the secure SDRAM controller (SDRC) registers, which export reset values to the SDRC registers.

**Table 7-21. Secure SDRC Registers**

Physical Address	Register Name	Description	Access
0x4800 2460	CONTROL_SECURE_SDRC_SHARING	SDRC sharing configuration	R/W
0x4800 2464	CONTROL_SECURE_SDRC_MCFG0	SDRC configuration register 0	R/W
0x4800 2468	CONTROL_SECURE_SDRC_MCFG1	SDRC configuration register 1	R/W

The secure SDRC registers are public and can be accessed without any restriction.

When the SECURE\_SDRC\_x\_WRDISABLE bit CONTROL.CONTROL\_SECURE\_SDRC\_x[31] is set, the register CONTROL.CONTROL\_SECURE\_SDRC\_x is locked and becomes read only.

At reset, the following occur:

- CONTROL.CONTROL\_SECURE\_SDRC\_SHARING[30:0] copies into SDRC.SDRC\_SHARING[30:0].
- CONTROL.CONTROL\_SECURE\_SDRC\_MCFG0[30:0] copies into SDRC.SDRC\_MCFG\_0[30:0].
- CONTROL.CONTROL\_SECURE\_SDRC\_MCFG1[30:0] copies into SDRC.SDRC\_MCFG\_1[30:0].

When LOCK bit SDRC.SDRC\_SHARING[30] is set, a copy of SDRC.SDRC\_SHARING[30:0] is made into CONTROL.CONTROL\_SECURE\_SDRC\_SHARING[30:0].

When LOCK bit SDRC.SDRC\_MCFG\_0[30] is set, a copy of SDRC.SDRC\_MCFG\_0[30:0] is made into CONTROL.CONTROL\_SECURE\_SDRC\_MCFG0[30:0].

When LOCK bit SDRC.SDRC\_MCFG\_1[30] is set, a copy of SDRC.SDRC\_MCFG\_1[30:0] is made into CONTROL.CONTROL\_SECURE\_SDRC\_MCFG1[30:0].

#### 7.4.7.5 OCMROM Secure Debug Register

[Table 7-22](#) describes the OCMROM secure debug register, which configures the secure ROM access for debug.

**Table 7-22. OCMROM Secure Debug Register**

Physical Address	Register Name	Description	Access
0x4800 24C0	CONTROL_OCMROM_SECURE_DEBUG	Secure ROM code debug configuration	Secure privilege (R/W) and public (R)

This register does not depend on the device type and can be accessed (read or write) only when the MPU is in secure privilege mode. Otherwise, a read to this register returns 0.

The OCMROM\_SECURE\_DEBUG bit CONTROL.CONTROL\_OCMROM\_SECURE\_DEBUG[0] must be set only when the secure debug is activated.

#### 7.4.7.6 Firewall Configuration Locked Register (Stacked Mode Only)

[Table 7-23](#) describes the firewall configuration locked register, which allows locking the configuration of all firewall registers that have configuration registers exported from the SCM. This register pertains only to stacked mode.

The reset value and the write capabilities of this register differ according to the device type.

**Table 7-23. Firewall Configuration Lock Register**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 246C	CONTROL_MODEM_FW_CONFIGURATION_LOCK	Control module locking mechanism	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

The debug must be activated before writing the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

#### 7.4.7.7 GPMC Boot Code Register (Stacked Mode Only)

[Table 7-24](#) describes the general-purpose memory controller (GPMC) boot code register, which configures the size of the flash boot code. This register pertains only to stacked mode.

**Table 7-24. GPMC Boot Code Register**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 2480	CONTROL_MODEM_GPMC_BOOT_CODE	GPMC flash boot code protection	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

This register does not depend on the device type. Access to this register is restricted according to the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

[Table 7-25](#) lists the GPMC boot code sizes.

**Table 7-25. GPMC Boot Code Size**

GPMC_BOOT_CODE_SIZE field CONTROL.CONTROL_GPMC_BOOT_CODE[4:0]	Size
0x0	Firewall deactivated (0x0)
0x1	1K byte
0x2	2K bytes
0x3	4K bytes
0x4	8K bytes
0x5	16K bytes
0x6	32K bytes
0x7	64K bytes
0x8	128K bytes
0x9	256K bytes
0xA	512K bytes
0xB	1M byte
0xC	2M bytes
0xD	4M bytes
0xE	8M bytes
0xF	16M bytes
0x10	32M bytes
0x11	64M bytes
0x12	128M bytes
0x13	256M bytes
0x14	512M bytes
0x15	1G byte
0x16	2G bytes

**Table 7-25. GPMC Boot Code Size (continued)**

GPMC_BOOT_CODE_SIZE field CONTROL.CONTROL_GPMC_BOOT_CODE[4:0]	Size
0x17	4G bytes
others	Not allowed

#### 7.4.7.8 Modem Memory Resources Configuration Register (Stacked Mode Only)

Table 7-26 describes the modem memory resources configuration register. This register pertains only to stacked mode.

**Table 7-26. Modem Memory Resources Configuration Register**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 2470	CONTROL_MODEM_MEMORY_RESOURCES_CONF	Modem memory resources allocation	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

This register does not depend on the device type. Access is restricted based on the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

#### 7.4.7.9 GPMC Modem Firewall Registers (Stacked Mode Only)

Table 7-27 describes the GPMC modem firewall registers, which export reset values to the GPMC firewall region 1. These registers pertain only to stacked mode.

**Table 7-27. GPMC Modem Firewall Registers**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 2474	CONTROL_MODEM_GPMC_DT_FW_REQ_INFO	Exported value to the GPMC modem firewall region 1 REQ_INFO_PERMISSION_1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)
0x4800 2478	CONTROL_MODEM_GPMC_DT_FW_RD	Exported value to the GPMC modem firewall region 1 READ_PERMISSION_1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)
0x4800 247C	CONTROL_MODEM_GPMC_DT_FW_WR	Exported value to the GPMC modem firewall region 1 WRITE_PERMISSION_1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

The GPMC modem firewall registers do not depend on the device type. Access is restricted according to the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

Before the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0] is set, CONTROL.CONTROL\_MODEM\_GPMC\_DT\_FW\_RD and CONTROL.CONTROL\_MODEM\_GPMC\_DT\_FW\_WR must be reprogrammed to authorize only the modem subsystem for read (CONTROL.CONTROL\_MODEM\_GPMC\_DT\_FW\_RD) or write (CONTROL.CONTROL\_MODEM\_GPMC\_DT\_FW\_WR) accesses.

#### 7.4.7.10 SMS Modem Firewall Registers (Stacked Mode Only)

Table 7-28 describes the SMS modem firewall registers, which export reset values to the SMS firewall region 1. These registers pertain only to stacked mode.

**Table 7-28. SMS Modem Firewall Registers**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 2484	CONTROL_MODEM_SMS_RG_ATT1	Exported value to the SMS modem firewall region 1 SMS_RG_ATT1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)
0x4800 2488	CONTROL_MODEM_SMS_RG_RDPERM1	Exported value to the SMS modem firewall region 1 SMS_RG_RDPERM1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)
0x4800 248C	CONTROL_MODEM_SMS_RG_WRPERM1	Exported value to the SMS modem firewall region 1 SMS_RG_WRPERM1 field	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

The SMS modem firewall registers do not depend on the device type. Access is restricted according to the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

On general-purpose devices, before the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0] is set, these registers must be reprogrammed to authorize only the modem subsystem.

#### 7.4.7.11 D2D Firewall Stacked Device Security Registers (Stacked Mode Only)

Table 7-29 and Table 7-30 describe the D2D firewall stacked device security registers. These registers pertain only to stacked mode.

**Table 7-29. D2D Firewall Stacked Device Security Registers**

Physical Address	Register Name	Description	Access	
			Device Type	
			G	S/T/E/B
0x4800 24D8	CONTROL_D2D_FW_STACKED_DEVICE_SECURITY	D2D reset and MPU IRQ acknowledge	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)
0x4800 24C4	CONTROL_D2D_FW_STACKED_DEVICE_SEC_DEBUG	D2D stacked device IRQ for firewall violation debug	Public and secure privilege (R/W)	

The reset values and write capabilities of the CONTROL.CONTROL\_D2D\_FW\_STACKED\_DEVICE\_SECURITY register differ according to the device type.

The CONTROL.CONTROL\_D2D\_FW\_STACKED\_DEVICE\_SEC\_DEBUG register does not depend on the device type.

**Table 7-30. Modem D2D Firewall Stacked Device Debug Mode Register**

Physical Address	Register Name	Description	Access	
			FWCONFIGURATIONLOCK	
			0	1
0x4800 2490	CONTROL_MODEM_D2D_FW_DEBUG_MODE	D2D firewall debug mode	Public and secure privilege (R/W)	Secure privilege (R/W) and public (R)

CONTROL.CONTROL\_MODEM\_D2D\_FW\_DEBUG\_MODE does not depend on the device type. Access is restricted according to the FWCONFIGURATIONLOCK bit CONTROL.CONTROL\_MODEM\_FW\_CONFIGURATION\_LOCK[0].

This register configures only the D2D bridge debug accesses between the modem and the application engine (APE) subsystem. The CONTROL\_MODEM\_GPMC\_DT\_FW\_REQ\_INFO and SMS\_RG\_ATT1 registers must be configured accordingly.

### 7.4.7.12 APE Firewall Default Secure Lock Register

Table 7-31 describes the APE firewall default secure lock register.

**Table 7-31. APE Firewall Default Secure Lock Register**

Physical Address	Register Name	Description	Access
0x4800 24BC	CONTROL_APE_FW_DEFAULT_SECURE_LOCK	Firewall default region configuration	Secure privilege (R/W) and public (R)

CONTROL\_APE\_FW\_DEFAULT\_SECURE\_LOCK does not depend on the device type and can be accessed (read or write) only when the MPU is in secure privilege mode. Otherwise, a read to this register returns 0.

#### 7.4.7.12.1 External Security Control Register

Table 7-32 describes the external security control register.

**Table 7-32. External Security Control Register**

Physical Address	Register Name	Description	Access	
			G/B/S	T/E
0x4800 24D4	CONTROL_EXT_SEC_CONTROL	External security control	Public (R) and secure privilege (R/W)	Public and secure privilege (R)

CONTROL\_EXT\_SEC\_CONTROL can be accessed (read or write) only when the MPU is in secure privilege mode. Otherwise, a read to this register returns 0.

The reset value and write capabilities of this register differ according to the device type.

### 7.4.7.13 Keys Access Registers

Table 7-33 describes the keys access registers.

**Table 7-33. Keys Access Registers**

Physical Address	Register Name	Description	Access
0x4800 2300+4.x	CONTROL_RPUB_KEY_H_x	Root public key hash	Public & Secure privilege (R)
0x4800 2318+4.x	CONTROL_RAND_KEY_x	Random keys	Secure privilege (R)
0x4800 2328+4.x	CONTROL_CUST_KEY_x	Customer keys	Secure privilege (R)
0x4800 2370+4.x	CONTROL_USB_CONF_x	USB conf	Public & Secure privilege (R)
0x4800 2380+4.x	CONTROL_FUSE_OPP_x	Fuse OPP/Fuse SR1/Fuse SR2	Public & Secure privilege (R)

These registers are part of the device eFuse configuration on the interconnect. Reading at the address of one of these registers provides a direct view into a part of the eFuse chain. The eFuse chain is valid and stable before the SCM comes out of reset state (internal power-on reset).

In case of eFuse chain reload, the device is kept in warm reset state; therefore, access through the interconnect interface to capture transient values is not possible.

These registers do not depend on the device type and are read-only registers and have no access restriction except CONTROL.CONTROL\_RAND\_KEY\_x, CONTROL.CONTROL\_CUST\_KEY\_x, and CONTROL\_TEST\_KEY\_x registers

CONTROL.CONTROL\_RAND\_KEY\_x, CONTROL.CONTROL\_CUST\_KEY\_x, and CONTROL\_TEST\_KEY\_x registers can be accessed only while the MPU is in secure privilege mode. In secure privilege mode, these registers can be accessed only if the SECKEYACCENABLE bit CONTROL.CONTROL\_SEC\_CTRL[2] is set to 1. They cannot be accessed on general-purpose devices. Outside secure privilege mode or when SECKEYACCENABLE bit CONTROL.CONTROL\_SEC\_CTRL[2] is not set, a read attempt to these registers results in an interface access error and no value is returned. These registers have no access restriction.

Some other Customer Keys are accessible from the System Control Module:

- CONTROL\_CEK\_x (with x=0 to 3)
- CONTROL\_CEK\_BCH\_x (with x=0 to 4)
- CONTROL\_MSV\_0
- CONTROL\_MSV\_BCH\_x (with x=0 or 1)
- CONTROL\_SWRV\_x (with x=0 to 4)

These registers only apply to the HS device. To determine if a HS version of your device is available and for more information on HS devices, please refer to your device-specific data manual.

#### 7.4.7.14 Memory DFT Read/Write Control Registers

Table 7-34 describes the memory DFT read/write control registers.

These registers can be accessed (read or write) only while the MPU is in secure privilege mode. They cannot be accessed on general-purpose devices.

Outside secure privilege mode, a read to these registers returns 0. In secure privilege mode, a read to these registers returns the current programmed value.

**Table 7-34. Memory DFT Read/Write Control Registers**

Physical Address	Register Name	Description	Access
0x4800 2278	CONTROL_MEM_DFTRW0	DFT read and write controls for memory blocks	Public (R) and secure privilege (R/W)
0x4800 227C	CONTROL_MEM_DFTRW1	DFT read and write controls for memory blocks	Public (R) and secure privilege (R/W)

#### 7.4.7.15 Control Dynamic Power Framework Registers

Table 7-35 lists the dynamic power framework control registers.

**Table 7-35. Control DPF Region Registers**

Physical Address	Register Name	Description	Access
0x4800 2498	CONTROL_DPF_OCM_RAM_FW_ADDR_MATCH	OCM-RAM dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 249C	CONTROL_DPF_OCM_RAM_FW_REQINFO	OCM-RAM dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24A0	CONTROL_DPF_OCM_RAM_FW_WR	OCM-RAM dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24A4	CONTROL_DPF_REGION4_GPMC_FW_ADDR_MATCH	GPMC dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24A8	CONTROL_DPF_REGION4_GPMC_FW_REQINFO	GPMC dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24AC	CONTROL_DPF_REGION4_GPMC_FW_WR	GPMC dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24B0	CONTROL_DPF_REGION1_IVA2_FW_ADDR_MATCH	IVA2 dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24B4	CONTROL_DPF_REGION1_IVA2_FW_REQINFO	IVA2 dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 24B8	CONTROL_DPF_REGION1_IVA2_FW_WR	IVA2 dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 2538	CONTROL_DPF_MAD2D_FW_ADDR_MATCH	MAD2D dynamic power framework handling	Public (R) and secure privilege (R/W)
0x4800 253C	CONTROL_DPF_MAD2D_FW_ADDR_MATCH	MAD2D dynamic power framework handling	Public (R) and secure privilege (R/W)

**Table 7-35. Control DPF Region Registers (continued)**

Physical Address	Register Name	Description	Access
0x4800 2540	CONTROL_DPF_MAD2D_FW_ADDR_MATCH	MAD2D dynamic power framework handling	Public (R) and secure privilege (R/W)

These registers do not depend on the device type. They can be accessed (read or write) only while the MPU is in secure privilege mode. They cannot be accessed on general-purpose devices.

Outside secure privilege mode, a read to these registers returns 0. In secure privilege mode, a read to these registers returns the current programmed value.

## 7.4.8 Debug and Observability

### 7.4.8.1 Description

**NOTE:** This feature is restricted to emulator and GP devices.

Figure 7-14 shows an overview of observability multiplexing, which minimizes the number of signals exchanged at the power domain boundary.

**Figure 7-14. Overview of the Debug and Observability Register Functionality**

108-017

Two layers of multiplexer are used to select the set of internal observable signals (PRCM signals, DMA requests, and interrupts) to be routed to the pins dedicated to the hardware debug.

The first layer is in the CORE power domain. It is controlled by the core control module registers and selects the set of internal signals from the CORE power domain to be routed. The second layer is in the WKUP power domain. It is controlled by the wake-up control module registers and selects the set of internal signals from the WKUP power domain.

The pads used for the hardware debug must be properly configured by selecting the hardware debug function (hw\_dbgn) of the pad. To configure the pads, select mode 5 (0b101) in the MUXMODE bit field of the CONTROL.CONTROL\_PADCONF\_CAM\_x register (only for hw\_dbg0 to hw\_dbg11), or select mode 7 (0b111) in the MUXMODE bit field of the CONTROL.CONTROL\_PADCONF\_ETK\_x register (for all hw\_dbgn).

Before selecting the CORE signals, the WKUPOBSMUX field of the CONTROL.CONTROL\_WKUP\_DEBOBS\_n registers must be set to 0.

---

**NOTE:** The pads used for the hardware debug must be properly configured by selecting the hardware debug function (hw\_dbgn) of the pad. To configure the pads, select mode 5 (0b101) in the MUXMODE bit field of the CONTROL.CONTROL\_PADCONF\_CAM\_x register (only for hw\_dbg0 to hw\_dbg11), or select mode 7 (0b111) in the MUXMODE bit field of the CONTROL.CONTROL\_PADCONF\_ETK\_x register (for all hw\_dbgn).

---

**Table 7-36. Observability Registers**

Physical Address	Register Name	Description	Access	
			Device Type	
			E/T/G	S/B
0x4800 2420	CONTROL_DEBOBS_0	Set and configure CORE observable signals 1 and 0	R/W	R
0x4800 2424	CONTROL_DEBOBS_1	Set and configure CORE observable signals 3 and 2	R/W	R
0x4800 2428	CONTROL_DEBOBS_2	Set and configure CORE observable signals 5 and 4	R/W	R
0x4800 242C	CONTROL_DEBOBS_3	Set and configure CORE observable signals 7 and 6	R/W	R
0x4800 2430	CONTROL_DEBOBS_4	Set and configure CORE observable signals 9 and 8	R/W	R
0x4800 2434	CONTROL_DEBOBS_5	Set and configure CORE observable signals 11 and 10	R/W	R
0x4800 2438	CONTROL_DEBOBS_6	Set and configure CORE observable signals 13 and 12	R/W	R
0x4800 243C	CONTROL_DEBOBS_7	Set and configure CORE observable signals 15 and 14	R/W	R
0x4800 2440	CONTROL_DEBOBS_8	Set and configure CORE observable signals 17 and 16	R/W	R
0x4800 2A68	CONTROL_WKUP_DEBOBS_0	Set and configure WKUP observable pins 3, 2, 1, 0	R/W	R
0x4800 2A6C	CONTROL_WKUP_DEBOBS_1	Set and configure WKUP observable pins 7, 6, 5, 4	R/W	R
0x4800 2A70	CONTROL_WKUP_DEBOBS_2	Set and configure WKUP observable pins 11, 10, 9, 8	R/W	R
0x4800 2A74	CONTROL_WKUP_DEBOBS_3	Set and configure WKUP observable pins 15, 14, 13, 12	R/W	R
0x4800 2A78	CONTROL_WKUP_DEBOBS_4	Set and configure WKUP observable pins 17, 16	R/W	R

The write capabilities of these registers differ according to the device type.

Perform the following steps to configure observability:

1. To configure the pads properly for hardware debug and observability, select the hardware debug (hw\_dbg) function mode 5 in the MUXMODE field of the CONTROL.CONTROL\_PADCONF\_CAM\_x or mode 7 in the MUXMODE field of the CONTROL.CONTROL\_PADCONF\_ETK\_X registers.

2. For the observability pads, set the proper values of the WKUPOBSMUX field CONTROL.CONTROL\_WKUP\_DEBOBS\_n. Up to 5 bits are used to select the signal set to be observed (0x00 selection sets the output to CORE\_OSMUXn signal). For more information, see the description of each register in [Section 7.4.8.2, Observability Tables](#).
3. To observe the CORE\_OSMUXn signals from the first layer of the multiplexer, set the WKUPOBSMUX field CONTROL.CONTROL\_WKUP\_DEBOBS\_n to 0x00, and then set the proper values of the OBSMUX field CONTROL.CONTROL\_DEBOBS\_n. A maximum of 7 bits is used to select the signal set to be observed (0b0000000 selection sets the output to 0).

For more information, see the description of each register in [Section 7.4.8.2, Observability Tables](#).

The observability feature of CONTROL.CONTROL\_DEBOBS\_n registers can be gated using the OBSERVABILITYDISABLE bit CONTROL.CONTROL\_SEC\_CTRL[5]. When set, this bit forces the internal signals CORE\_OBSMUXn to 0 as if the OBSMUX field CONTROL.CONTROL\_DEBOBS\_n is set to 0x000.

The observability feature of the CONTROL.CONTROL\_WKUP\_DEBOBS\_n registers can be gated using the OBSERVABILITYDISABLE bit CONTROL.CONTROL\_WKUP\_DEBOBS\_4[31]. When set, if the pads are configured for the hardware debug, outputs are set to 0.

### 7.4.8.2 Observability Tables

This section gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. Unavailable module and feature pins are not functional.

[Table 7-37](#) through [Table 7-72](#) define the mapped internal signals for each OBSMUX and WKUPOBSMUX value.

**Table 7-37. Internal Signals Multiplexed on OBSMUX0**

Out Signal Name	Muxed Signal Name	OBSMUX0 Field CONTROL.CONTROL_DEBOBS_0 [22:16] (dec)	Description	High State	Low State
CORE_OBSMUX0 <sup>(1)</sup>	tie_low	0	Signal tied low	-	Active state low
	CM_96_FCLK	1	96 MHz functional clock of the CM module.	-	-
	CM_32K_CLK	2	32 kHz functional clock of the CM module.	-	-
	PRCM_DPLL3_enable	3	Signal used to enable DPLL3.	DPLL is enabled	DPLL is disabled
	PRCM_CAM_domainFreeze	4	Indicates if the CAM domain is frozen.	Domain is frozen	Domain is not frozen
	PRCM_NEON_forceWakeup	5	Indicates if a wakeup of the NEON domain is forced.	Wakeup is forced	Wakeup is not forced
	PRCM_COREL4_domainNready	6	Indicates if the CORE_L4 domain is ready. In other words, is domain transition on-going ?	Domain is not ready	Domain is ready
	PRCM_WKUP_domainNready	7	Indicates if the WKUP domain is ready. In other words, is domain transition on-going ?	Domain is not ready	Domain is ready
	PRCM_STATE_IS_OFF_IVA2	8	Indicates to the global Power Manager FSM that the IVA2 domain power state is ON	FSM state is OFF	FSM state is not OFF
	MPU_INTC.IDLEACK	9	Indicates acknowledgement for idle mode of MPU_INTC. See the <i>PRCM</i> chapter for more information about idle signal.	Acknowledgement is asserted	No acknowledgement

<sup>(1)</sup> 0x00 in WKUPOBSMUX0 field CONTROL.CONTROL\_WKUP\_DEBOBS\_0[4:0]

**Table 7-37. Internal Signals Multiplexed on OBSMUX0 (continued)**

Out Signal Name	Muxed Signal Name	OBSMUX0 Field CONTROL.CONTROL_DEBOBS_0 [22:16] (dec)	Description	High State	Low State
	SR[1].IDLEACK	10	Indicates acknowledgement for idle mode of Smart Reflex 1. See the <i>PRCM</i> chapter for more information about idle signal.	Acknowledgement is asserted	No acknowledgement
	SAD2D_MSTANDBY	11	SAD2D Mstandby assertion.	-	-
	Reserved	12	-	-	-
	SAD2D_GICLK	13	Interface clock of the L4 interconnect in the SAD2D domain.	-	-
	Reserved	(16:14)	-	-	-
	sdma_PI_DMAREQ	(87:17)	DMA requests lines mapped to the System DMA module. See the <i>DMA</i> chapter for more information about the System DMA request mapping.	-	-
	sgx_SINTERRUPTN	(104:88)	Interrupt lines from the SGX. See the <i>SGX</i> chapter for more information about the Interrupt Requests mapping.	-	-
	Reserved	(116:105)	-	-	-
	SD2D_PICLKOCP	117	Interface clock of SD2D	-	-
	Reserved	118	-	-	-
	SD2D_PICLKOCP	119	Interface clock of SD2D	-	-
	Reserved	(127:120)	-	-	-

**Table 7-38. Internal Signals Multiplexed on OBSMUX1**

Out Signal Name	Muxed Signal Name	OBSMUX1 Field CONTROL.CONTROL_DEBOBS_0[6:0] ] (dec)	Description	High State	Low State
CORE_OBSMUX1 <sup>(1)</sup>	tie_low	0	Signal tied low	-	Active state low
	PRCM_DPLL3_M2_CLK	1	M2 clock generated by DPLL3.	-	-
	CM_SYS_CLK	2	System clock	-	-
	PRCM_DPLL3_enablediv	3	Signal used to enable the clock divisor of DPLL3.	DPLL clock divisor is enabled	DPLL clock divisor is disabled
	PRCM_DPLL2_ClkIsNotRunning	4	Indicates if the clock of DPLL2 is running or not.	Clock is not running	Clock is running
	PRCM_NEON_domainNready	5	Indicates if the NEON domain is ready. In other words, is domain transition on-going?	Domain is not ready	Domain is ready
	PRCM_CORED2D_domainNready	6	Indicates if the CORE_D2D domain is ready. In other words, is domain transition ongoing?	Domain is not ready	Domain is ready
	PRCM_WKUP_domainNready	7	Indicates if the WKUP domain is ready. In other words, is domain transition on-going?	Domain is not ready	Domain is ready
	PRCM_STATE_IS_ON_CORE	8	Indicates to the global Power Manager FSM that the MPU domain power state is ON	FSM state is ON	FSM state is not ON

<sup>(1)</sup> 0x00 in WKUPOBSMUX1 field CONTROL.CONTROL\_WKUP\_DEBOBS\_0[12:8]

	PRCM_vdd4_domain_is_on	8	Indicates to the global Power Manager FSM that the VDD4 domain power state is ON.	State is ON	State is not ON
	PRCM_SYS_CLKREQ_oe	9	Indicates if the SYS_CLKREQ pin is used as an output (Output enable).	Output enabled	Output disabled
	PRCM_SRAMALLRET[0]	10	SRAM retention on signal to all power domain (bit 0).	Retention is ON	Retention is OFF
	PRCM_MPU_SRAMRETG OODOUT[0]	11	Indicates if the SRAM retention banks in the MPU domain are stable (bit 0).	Power is stable	Power is not stable
	PRCM_IVA2_SRAMAGOODOUT[3]	12	IVA2 array Powergood indication from SRAM to PSCON (bit 3).	Power is stable	Power is not stable
	PRCM_CORE_POWER_RET	13	CORE domain switch command for power-retention.	Retention is ON	Retention is OFF
	PRCM_CORE_SRAMRET ONIN[5]	14	SRAM retention on signal to CORE power domain (bit 5).	Retention is ON	Retention is OFF
	PRCM_SGX_SRAMAGOODOUT[0]	15	SGX array Powergood indication from SRAM to PSCON (bit 0).	Power is stable	Power is not stable
	PRCM_CAM_POWER_GOOD[3]	16	Indicates if the CAM power switches status (bit 3).	Power is stable	Power is not stable
	PRCM_DPLL2_POWER_ON	17	DPLL2 switch command for power-on.	Power is ON	Power is OFF
	PRCM_PER_POWER_ISO	18	PM command for PER domain isolation.	Isolation is ON	Isolation is OFF
	PRCM_WAKEEMU	19	This event is used to power-up the EMULATION power domain if it has been previously turned-off; or prevent any further transition to OFF triggered by the applicative software if it was already ON.	EMU domain is forced ON	-
PRCM_GPT2_SWAKEUP	20	GP-Timer2 asserts this signal to initiate a transition to WAKEUP mode.	Transition initiated	Wakeup conditions not reached

## 7.4.9 Electromagnetic Interference Reduction for Clocking Generation (Spreading)

### 7.4.9.1 Overview

There are two major forms of digital signals: digital-data and digital-clock (CLK). Digital signals are the principal signal form in today's digital electronic products.

- A digital-data signal can be viewed as a sequence of pulses with different pulse widths
- A clock (CLK) signal is usually a string of rectangular pulses with the same pulse width

In the case of a clock, the generated signal has a predetermined frequency. Electromagnetic radiations such as radio frequency emissions are also generated from the constant frequency clock signals and their harmonics. Unfortunately, a problem exists with some devices such as communication devices for example in that the system clock generates unwanted spurious signals that interfere with the decoding of information from received signals by a receiver of the communication device. Note that data periodicity also causes interference.

This periodicity generates a significant power peak at the selected frequency, which in turn causes an EMI disturbance to the environment.

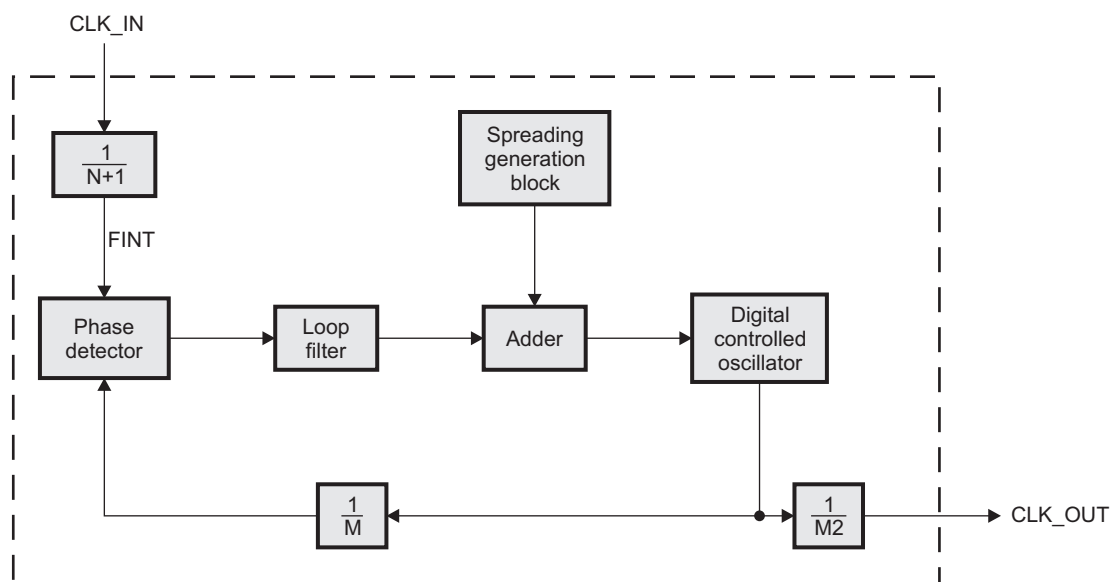

The harmonics of the generated signal system clock radiates in the other modules of the device, and the spurious energy can be enough to cause enough interference, which results in performance degradation (in the form of high bit error rates in case of a wireless communication interface for example).

In order to reduce the power peaks (and thus the energy of the electromagnetic noise generated for a specific frequency), an internal frequency modulation of the DPLL is used to distribute the energy to many different frequencies, thus reducing the power peaks.

This frequency modulation feature is directly integrated in some DPLLs of the device. The DPLLs that support this additional feature are called DPLL-D in the following.

Figure 7-15 shows a diagram of a DPLL that supports the EMI reduction feature.

**Figure 7-15. DPLL with EMI Reduction Feature**

108-033

The additional features of the DPLL compliant with EMI reduction are:

- EMI Reduction using Triangular frequency modulation, also called Spread Spectrum Clocking (SSC).

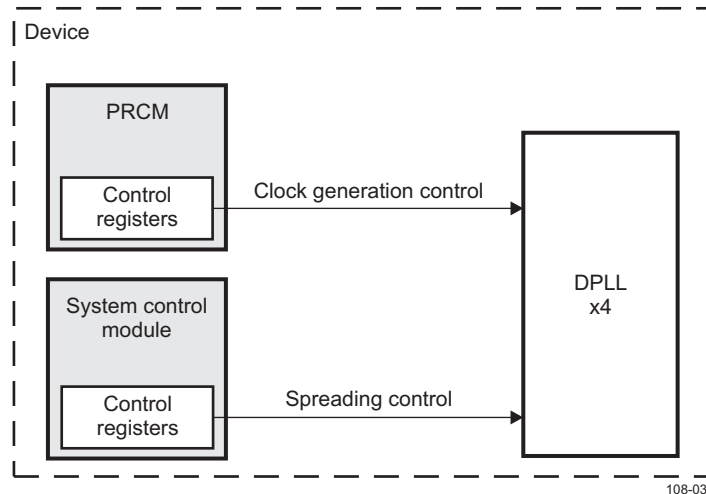

### 7.4.9.2 Integration

The four following DPLLs/Domains of the devices that support the EMI reduction feature are:

- DSS/DSI DPLL
- CORE domain DPLL
- PER domain DPLL
- USBHOST DPLL

Figure 7-16 highlights the four DPLL-D integration in the device.

**Figure 7-16. DPLL-D Integration**

The control of the DPLL is done both by the PRCM and the System Control Module:

- The PRCM controls the clocking generation of the DPLL. For more information, see the *Power Reset and Clock Management* chapter.
- The System Control Module contains all necessary bits that controls the EMI Reduction feature (Spread Spectrum Clocking).

#### 7.4.9.2.1 Clocking, Reset, and Power Management Scheme

Please see the *Power Reset and Clock Management* chapter.

### 7.4.9.3 Functional Description

#### 7.4.9.3.1 Spreading Generation Block

Figure 7-17 shows a diagram of the Spreading Generation block.

108-035

**NOTE:**  $\Delta f$  is the deviation from the center frequency. The total spreading deviation is equal to twice  $\Delta f$ .

$f_c$  is the original clock frequency.

$f_m$  is the spreading frequency.

This additional block generates the required waveform used to reduce EMI. This waveform is then modulated with the initial signal in order to add some controlled deviation in the clock signal frequency, which spreads the energy of the clock and its harmonics into a band of frequencies, and then reduces the Electromagnetic Interferences.

The **SSC\_SPREAD** value handles the deviation (amplitude) of the generated signal from the original signal. It is controlled by the CONTROL.CONTROL\_XXX\_DPLL\_SPREADING[3:2] XXX\_SPREADING\_AMPLITUDE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs). Note that this register contains only a spreading ratio  $K$ , which is equal to  $\Delta f / f_m$ .

The **SSC\_FREQ** value controls the rate of the generated signal. It is controlled by the CONTROL.CONTROL\_XXX\_DPLL\_SPREADING[1:0] XXX\_SPREADING\_RATE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs).

The **SSC\_EN** signal enables/disables the frequency modulation feature of the DPLL. It is controlled by the CONTROL.CONTROL\_XXX\_DPLL\_SPREADING[4] XXX\_SPREADING\_ENABLE bit field of the corresponding registers (where XXX is the name of the concerned DPLLs).

In any case the frequency modulation will be programmed in the System Control Module and it is not generally something that needs to be changed in real time.

### 7.4.9.3.2 Spread Spectrum Clocking (SSC)

#### 7.4.9.3.2.1 Definition

The aim of the Spread Spectrum Clocking is to add a variation in the frequency of an original clock, which spreads the generated interferences over a larger band of frequency.

In theory, Spread Spectrum Clocking means that the clock signal is varied around the desired frequency. For example, for a 1 GHz clock, the frequency might be 999.5 Mhz at one moment in time and 1.0005 GHz at another. Doing this constantly causes the power of the tone to be "spread" out more over a broader band of tight frequencies (centered at the desired tone). To realize this constant variation on the original signal, a modulation with an additional signal (called spreading waveform) is realized.

Creating a spread-spectrum clock by spreading the initial clock frequency is done by defining the following parameters:

- The spreading frequency (deviation), which is the ratio of the range of spreading frequency over the original clock frequency.
- The modulation rate ( $f_m$ ), which is used to determine the clock-frequency spreading-cycling rate, and is the time during which the generated clock frequency varies through  $\Delta f$  and returns to the original frequency.
- The modulation waveform, which describes the variation curve in term of time.

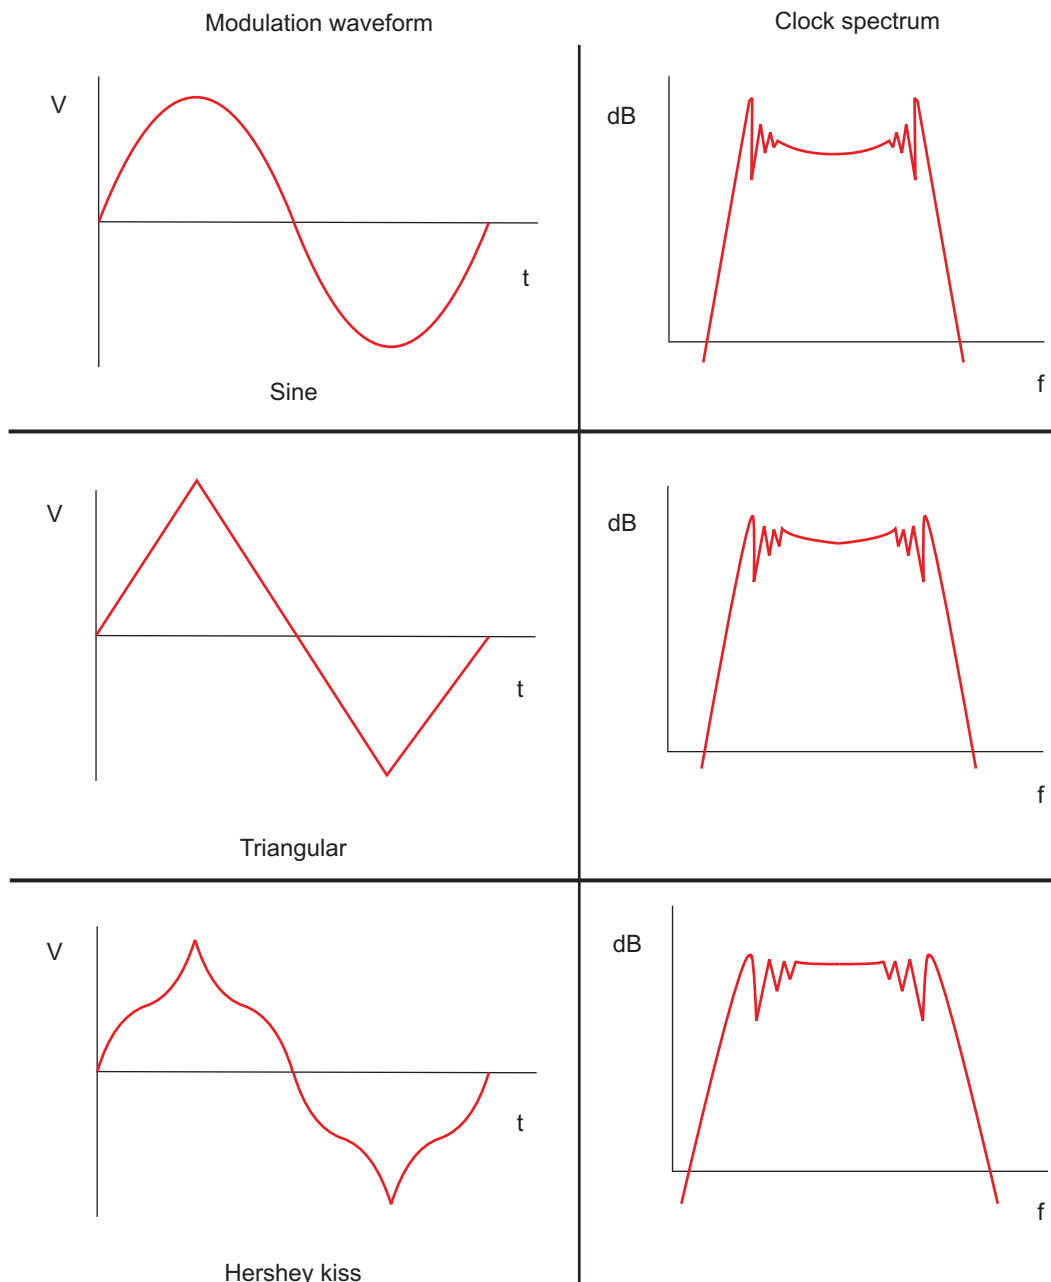

The spectral power reduction in the DPLL clocks is dependent on the Modulation Index (K) which is a ratio of spreading frequency, calculated from the frequency deviation ( $\Delta f$ ) and the modulation rate ( $f_m$ ).

### 7.4.9.3.2.2 The Modulation Waveforms

The shape (profile) of the generated clock signal depends on the modulation waveform that is used during the frequency modulation. Several profiles can be used, according to the desired shaping for the energy spreading.

Figure 7-18 shows three examples of modulation waveforms and the spectrum of the corresponding modulated clock signal.

**Figure 7-18. Modulation Profiles**

108-036

The triangular wave gives a relatively flat spectrum and is also easy to generate. The triangular waveform is used by the DPLL-D.

7.4.9.3.2.3 Effects on the Clock Signal

Figure 7-19 gives an example of the effect of a triangular spreading on a clock signal.

Figure 7-19. Effect of the SSC in Frequency

Figure 7-19 highlights the power reduction of the main peak, but also the flatter aspect of the modulated signal. One could notify that the minimum level of the second signal is higher than the first one. This effect is normal and is due to the "noise" added for the modulation.

**NOTE:** The spreading technique "scatters" the energy of the peaks on the other frequencies, which reduces the power of the peaks but increases the global "noise" of the signal.

Figure 7-20 shows the effect of a triangular spreading on a clock signal in the Time Domain.

Figure 7-20. Effect of the SSC in the Time Domain

#### 7.4.9.3.2.4 Estimation of the EMI Reduction Level

Figure 7-21 shows the effect of the spreading on a clock and its harmonics.

**Figure 7-21. Peaks Reduction Due to Spreading**

108-037

The electromagnetic interference reduction can be estimated with the following equation:

$$(1) \text{ Peak\_power\_reduction} = 10 * \log ((\text{Deviation} * f_c) / f_m)$$

With:

- Peak\_power\_reduction in dB
- Deviation in % of the initial clock frequency ( $f_c$ ), equals to  $\Delta f / f_c$
- $f_c$  is the original clock frequency, in MHz
- $f_m$  is the spreading frequency, in MHz

According to equation (1), it is also possible to compute the deviation, and then  $\Delta f$ , for a required peak power reduction:

$$(2) \text{ Deviation} = (f_m / f_c) * 10^{(\text{Peak\_power\_reduction} / 10)}$$

Example:

For  $f_c=400\text{MHz}$ , Deviation =1% peak from  $f_c$  ( $\Delta f = 4\text{MHz}$ ) and  $f_m=400\text{kHz}$ , the estimated peak power reduction is 10dB.

#### 7.4.9.3.2.5 Bandwidth Calculation (Carson Bandwidth Rule)

Carson's bandwidth rule defines the approximate bandwidth requirements of communications system components for a carrier signal that is frequency modulated by a continuous or broad spectrum of frequencies rather than a single frequency.

Carson's bandwidth rule is expressed by the relation  $\text{CBR} = 2 * (\Delta f + f_m)$  where CBR is the bandwidth requirement,  $\Delta f$  is the peak frequency deviation, and  $f_m$  is the highest frequency in the modulating signal.

For example, an FM signal with 5kHz peak deviation, and a maximum audio frequency of 3 kHz, would require an approximate bandwidth  $2*(5+3) = 16$  kHz.

Theoretically any FM signal will have an infinite number of sidebands and hence an infinite bandwidth but in practice all significant sideband energy (98% or more) is concentrated within the bandwidth defined by Carson's rule.

**7.4.9.3.3 Frequency Limitations**

There are some limitations on the use of the Spreading feature. Figure 7-22 shows the supported Spreading frequency and deviation.

**Figure 7-22. Supported Spreading Frequency and Deviation**

		SPREADING_AMPLITUDE (bits [3:2])			
		00	01	10	11
		K			
		4	6	8	10
SPREADING_RATE (bits [1:0])	Min to Max rate (kHz)	Frequency deviation +/- kHz			
00	62.5 to 125	250 to 500	375 to 750	500 to 1000	625 to 1250
01	125 to 250	500 to 1000	750 to 1500	1000 to 2000	1250 to 2500
10	250 to 500	1000 to 2000	1500 to 3000	2000 to 4000	2500 to 5000
11	500 to 1000	2000 to 4000	3000 to 6000	4000 to 8000	5000 to 10000

 Not recommended. PLL jitter degradation and modulation amplitude not a linear function of FM.

108-040

Even if all the previous frequencies and deviations are supported by the DPLL-D, a range of "Safe operating regions" has been defined according to its impact on jitter.

Figure 7-22 shows the supported safe operating regions supported by the DPLL-D.

**Figure 7-23. Supported Safe Operating Regions and Jitter Impact**

CLKOUT FREQUENCY (25–900 MHz)	Recommended safe operating region				Max jitter impact in % due to spreading
400–900					+/- 1.25%
200–399					+/- 1.25%
100–199					+/- 1.25%
50–99					+/- 1.00%
25–49					+/- 2.00%

108-041

(1) Please see Figure 7-22 for color coding)

## 7.4.9.4 Basic Programming Model

### 7.4.9.4.1 Spread Spectrum Clocking Configuration

The configuration of the spreading feature is not mandatory when programming the DPLL. This feature is usually enabled when the DPLL clocks generate harmonics which can potentially interfere with the GSM carrier frequencies.

Once the "clock generation control" registers are configured, it is possible to configure the spreading on the clock signal.

The first thing to do is to calculate the *Deviation* and/or the *Spreading Rate* according to the desired peak power reduction. In addition to this, it is necessary to have  $K$  (modulation index), which value is equal to  $\Delta f / f_m$ .

Then, both XXX\_SPREADING\_AMPLITUDE and XXX\_SPREADING\_RATE bitfields can be configured with the calculated values.

Finally, the spreading has to be enabled using the XXX\_SPREADING\_ENABLE bit.

---

**NOTE:** It is necessary to carefully configure the spreading on a clock in order to avoid adding some "noise" on frequencies that are used by another module. For example, adding spreading on a clock to reduce noise on GSM frequencies can "move" the generated noise to the memory controller's frequency, and then degrade its performances.

---

Example:

For  $f_c=400\text{MHz}$ , Deviation = 1% peak from  $f_c$  ( $\Delta f = 4\text{MHz}$ ) and  $f_m=400\text{kHz}$ , the estimated peak power reduction is 10dB.  $K$  is then equal to 10. The DPLL can be configured as follow:

- XXX\_SPREADING\_RATE = 10 (250 to 500 KHz)
- XXX\_SPREADING\_AMPLITUDE = 11 ( $K = 10$ )
- XXX\_SPREADING\_ENABLE = 1

The state of the modulation feature can be monitored with the XXX\_SPREADING\_ENABLE\_STATUS bit of the corresponding register.

---

**NOTE:**

- To support the spreading feature the DPLL Bandwidth is restricted to a max of 70KHz. This implies the Reference Clock frequency to be in range 0.75MHz to 2.1MHz, and then the XXX\_DPLL\_FREQSEL[3:0] bitfield to be in range "0011" to "0111".
  - The required  $\Delta f$  (Frequency deviation) is targeted on the CLKOUT Frequency is achieved when M2 is programmed to 1. Otherwise the frequency deviation will be scaled down by the factor of M2 value. However, this does not affect the deviation, so frequency change of harmonics at GSM frequencies is the same.
  - The spread of modulation frequency within each range is due to an internal auto-ranging function and specific frequencies cannot be selected.
  - The lowest range (62.5 to 125 KHz) should only be selected when Reference Clock (PLL internal reference frequency) < 1.1 MHz is being used, to prevent the PLL feedback loop from canceling the modulation.
- 

When deactivating the spreading (XXX\_SPREADING\_ENABLE = 0), the End-of-Spreading is synchronous to the internal spreading cycle. So there is no residual average frequency error. PER\_DPLL\_SPREADING\_RATE option is not supported.

## 7.5 System Control Module Programming Model

### 7.5.1 Feature Settings

#### 7.5.1.1 Force Pad Configuration MuxMode by High-Speed USB

The two pads `hsusb0_data0` and `hsusb0_data1` can force pad configuration MuxMode when the CARKITEN signal is generated:

- CARKITHSUSB0DATA0AUTOEN bit CONTROL.CONTROL\_DEVCONF1[19]:
  - 0: The `hsusb0_data0` MuxMode signal is driven by MUXMODE1 bit CONTROL.CONTROL\_PADCONF\_HSUSB0\_NXT[18:16].
  - 1: The `hsusb0_data0` MuxMode signal is forced to 0x2 when the CARKITEN signal is active.
- CARKITHSUSB0DATA1AUTOEN bit CONTROL.CONTROL\_DEVCONF1[20]:
  - 0: The `hsusb0_data1` MuxMode signal is driven by MUXMODE0 bit CONTROL.CONTROL\_PADCONF\_HSUSB0\_DATA[2:0].
  - 1: The `hsusb0_data1` MuxMode signal is forced to 0x2 when the CARKITEN signal is active.

---

**NOTE:** Associated pad configuration registers remain unchanged.

---

For more details on High-Speed USB, see the *High-Speed USB Controllers* chapter.

#### 7.5.1.2 Video Driver

This section gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. Unavailable module and feature pins are not functional.

- TVOUTBYPASS bit CONTROL.CONTROL\_DEVCONF1[18]:
  - 0b0: Dual 10-bit video DAC TV out bypass disable
  - 0b1: Dual 10-bit video DAC TV out bypass enable
- TVACEN bit CONTROL.CONTROL\_DEVCONF1[11]:
  - 0b0: Enables dc coupling for TV output
  - 0b1: Enables ac coupling for TV output

For more details on video DACs, see the *Display Subsystem* chapter.

#### 7.5.1.3 McBSP1 Internal Clock

The McBSP1 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP1.

- MCBSP1\_FSR bit CONTROL.CONTROL\_DEVCONF0[4]:
  - 0: FSR is from the pin `mcbasp1_fsr`.
  - 1: FSR is from the pin `mcbasp1_fsx`.
- MCBSP1\_CLKR bit CONTROL.CONTROL\_DEVCONF0[3]:
  - 0: CLKR is from the pin `mcbasp1_clkr`.
  - 1: CLKR is from the pin `mcbasp1_clkx`.
- MCBSP1\_CLKS bit CONTROL.CONTROL\_DEVCONF0[2]:
  - 0: CLKS is from the PRCM functional clock.
  - 1: CLKS is from the pin `mcbasp_clks`.

For more details on McBSP, see the *Multichannel Serial Port Interface* chapter.

#### 7.5.1.4 McBSP2 Internal Clock

The McBSP2 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP2. The McBSP2 does not have `mcbasp2_clkr` and `mcbasp2_fsr` external pins. Clock input is from the `mcbasp2_clkx` pin; FSR input is from the `mcbasp2_fsx` pin.

- `MCBSP2_CLKS` register bit `CONTROL.CONTROL_DEVCONF0[6]`:
  - 0: Clock is from the PRCM functional clock.
  - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see the *Multichannel Serial Port Interface* chapter.

#### 7.5.1.5 McBSP3 Internal Clock

The McBSP3 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP3. The McBSP3 does not have `mcbasp3_clkr` and `mcbasp3_fsr` external pins. Clock input is from the `mcbasp3_clkx` pin; FSR input is from the `mcbasp3_fsx` pin.

- `MCBSP3_CLKS` register bit `CONTROL.CONTROL_DEVCONF1[0]`:
  - 0: Clock is from the PRCM functional clock.
  - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see the *Multichannel Serial Port Interface* chapter.

#### 7.5.1.6 McBSP4 Internal Clock

The McBSP4 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP4. The McBSP4 does not have `mcbasp4_clkr` and `mcbasp4_fsr` external pins. Clock input is from the `mcbasp4_clkx` pin; FSR input is from the `mcbasp4_fsx` pin.

- `MCBSP4_CLKS` register bit `CONTROL.CONTROL_DEVCONF1[2]`:
  - 0: Clock is from the PRCM functional clock.
  - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see the *McBSP* chapter.

#### 7.5.1.7 McBSP5 Internal Clock

The McBSP5 internal clock gates the internal interconnect clock and selects the FSR, CLKR, and CLKS input for the McBSP5. The McBSP5 does not have `mcbasp5_clkr` and `mcbasp5_fsr` external pins. Clock input is from the `mcbasp5_clkx` pin; FSR input is from the `mcbasp5_fsx` pin.

- `MCBSP5_CLKS` register bit `CONTROL.CONTROL_DEVCONF1[4]`:
  - 0: Clock is from the PRCM functional clock.
  - 1: Clock is from the external pin `mcbasp_clks`.

For more details on McBSP, see the *McBSP* chapter.

#### 7.5.1.8 MMC/SD/SDIO1 Module Input Clock Selection

- `MMCSDIO1ADPCLKISEL` bit `CONTROL.CONTROL_DEVCONF0[24]`:
  - 0: Input clock is from the external pin.
  - 1: Internal loopback, module input clock is copied from the module output clock.

#### 7.5.1.9 MMC/SD/SDIO2 Module Input Clock Selection

- `MMCSDIO2ADPCLKISEL` bit `CONTROL.CONTROL_DEVCONF1[6]`:
  - 0: Input clock is from the external pin.
  - 1: Internal loopback, module input clock is copied from the module output clock.

### 7.5.1.10 Setting Sensitivity on SYS\_NDMAREQ[6:0] Input Pins

The seven SYS\_NDMAREQ0 to SYS\_NDMAREQ6 input pins can be either level or edge sensitive.

- SENSDMAREQ0 bit CONTROL.CONTROL\_DEVCONF0[0]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ1 bit CONTROL.CONTROL\_DEVCONF0[1]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ2 bit CONTROL.CONTROL\_DEVCONF1[7]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ3 bit CONTROL.CONTROL\_DEVCONF1[8]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ4 bit CONTROL.CONTROL\_DEVCONF1[21]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ5 bit CONTROL.CONTROL\_DEVCONF1[22]:  
0: Level sensitivity  
1: Edge sensitivity
- SENSDMAREQ6 bit CONTROL.CONTROL\_DEVCONF1[23]:  
0: Level sensitivity  
1: Edge sensitivity

For more details on DMA, see the *DMA* chapter.

### 7.5.1.11 I<sup>2</sup>C I/O Internal Pull-up Enable

The I/O internal pull-up of I2C1, I2C2, and I2C3 can be enabled:

- I2C1HSMASER bit CONTROL.CONTROL\_DEVCONF1[12]:  
0: I2C1 I/O internal pull-up disable  
1: I2C1 I/O internal pull-up enable
- I2C2HSMASER bit CONTROL.CONTROL\_DEVCONF1[13]:  
0: I2C2 I/O internal pull-up disable  
1: I2C2 I/O internal pull-up enable
- I2C3HSMASER bit CONTROL.CONTROL\_DEVCONF1[14]:  
0: I2C3 I/O internal pull-up disable  
1: I2C3 I/O internal pull-up enable

---

**NOTE:** This feature is used for the master component.

---

For more details on I<sup>2</sup>C, see the *Inter-Integrated Circuit* chapter.

### 7.5.1.12 SDRC I/O Drive Strength Selection

- SDRC\_LOWDATA bit CONTROL.SCM\_CONTROL\_PROG\_IO0[31] selects data[15:0] DQS0, DQS1, DM0 and DM1 I/O drive strength:  
0: Load range = [2 pF - 6 pF]  
1: Load range = [6 pF - 12 pF]
- SDRC\_HIGHDATA bit CONTROL.SCM\_CONTROL\_PROG\_IO0[30] selects data[31:16] DQS2, DQS3, DM2 and DM3 I/O drive strength:

- 0: Load range = [2 pF - 6 pF]
- 1: Load range = [6 pF - 12 pF]
- SDRC\_ADDRCRTL bit CONTROL.SCM\_CONTROL\_PROG\_IO0[29] selects address NRAS, NCAS, NWE, NCLK, CLK, BA0 and BA1 I/O drive strength:
  - 0: Load range = [2 pF - 6 pF]
  - 1: Load range = [6 pF - 12 pF]
- SDRC\_NCS0 bit CONTROL\_PROG\_IO0[28] selects NCS0 and CKE0 I/O drive strength
- SDRC\_NCS1 bit CONTROL\_PROG\_IO0[27] selects NCS1 and CKE1 I/O drive strength

#### 7.5.1.13 GPMC I/O Drive Strength Selection

- GPMC\_A1 bit CONTROL.CONTROL\_PROG\_IO0[26] selects GPMC\_A1 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A2 bit CONTROL.CONTROL\_PROG\_IO0[25] selects GPMC\_A2 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A3 bit CONTROL.CONTROL\_PROG\_IO0[24] selects GPMC\_A3 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A4 bit CONTROL.CONTROL\_PROG\_IO0[23] selects GPMC\_A4 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A5 bit CONTROL.CONTROL\_PROG\_IO0[22] selects GPMC\_A5 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A6 bit CONTROL.CONTROL\_PROG\_IO0[21] selects GPMC\_A6 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A7 bit CONTROL.CONTROL\_PROG\_IO0[20] selects GPMC\_A7 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A8 bit CONTROL.CONTROL\_PROG\_IO0[19] selects GPMC\_A8 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_A9 bit CONTROL.CONTROL\_PROG\_IO0[18] selects GPMC\_A9 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_MIN\_CFG bit CONTROL.CONTROL\_PROG\_IO0[16] selects data[7:0] I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_D8\_D15 bit CONTROL.CONTROL\_PROG\_IO0[15] selects data[15:8], NOE, NWE, NADV\_ALE and WAIT0 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS0 bit CONTROL.CONTROL\_PROG\_IO0[14] selects GPMC\_NCS0 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS1 bit CONTROL.CONTROL\_PROG\_IO0[13] selects GPMC\_NCS1 I/O drive strength
  - 0: Load range = [2pf : 6pf]

- 1: Load range = [6pf : 12pf]
- GPMC\_NCS2 bit CONTROL.CONTROL\_PROG\_IO0[12] selects GPMC\_NCS2 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS3 bit CONTROL.CONTROL\_PROG\_IO0[11] selects GPMC\_NCS3 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS4 bit CONTROL.CONTROL\_PROG\_IO0[10] selects GPMC\_NCS4 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS5 bit CONTROL.CONTROL\_PROG\_IO0[9] selects GPMC\_NCS5 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS6 bit CONTROL.CONTROL\_PROG\_IO0[8] selects GPMC\_NCS6 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NCS7 bit CONTROL.CONTROL\_PROG\_IO0[7] selects GPMC\_NCS7 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_CLK bit CONTROL.CONTROL\_PROG\_IO0[6] selects GPMC\_CLK I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NBE0\_CLE bit CONTROL.CONTROL\_PROG\_IO0[5] selects GPMC\_NBE0\_CLE I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NBE1 bit CONTROL.CONTROL\_PROG\_IO0[4] selects GPMC\_NBE1 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_NWP bit CONTROL.CONTROL\_PROG\_IO0[3] selects GPMC\_NWP I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_WAIT1 bit CONTROL.CONTROL\_PROG\_IO0[2] selects GPMC\_WAIT1 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_WAIT2 bit CONTROL.CONTROL\_PROG\_IO0[1] selects GPMC\_WAIT2 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]
- GPMC\_WAIT3 bit CONTROL.CONTROL\_PROG\_IO0[0] selects GPMC\_WAIT3 I/O drive strength
  - 0: Load range = [2pf : 6pf]
  - 1: Load range = [6pf : 12pf]

#### 7.5.1.14 MCBSP2 I/O Drive Strength Selection

- MCBSP2\_MIN\_CTL field CONTROL.CONTROL\_PROG\_IO1[7:6] selects FSX, CLKX, DR and DX I/O drive strength
  - 0: 8 mA
  - 2: 6 mA
  - 1: 4 mA
  - 3: 2 mA

### 7.5.1.15 MCSPI1 I/O Drive Strength Selection

- MCSPI1\_MIN\_CTL field CONTROL.CONTROL\_PROG\_I01[5:4] selects CLK, SOMI, SIMO and CS0 I/O drive strength
  - 0: 8 mA
  - 2: 6 mA
  - 1: 4 mA
  - 3: 2 mA
- MCSPI1\_CS1 field CONTROL.CONTROL\_PROG\_I01[3:2] selects CS1 I/O drive strength
  - 0: 8 mA
  - 2: 6 mA
  - 1: 4 mA
  - 3: 2 mA
- MCSPI1\_CS2 field CONTROL.CONTROL\_PROG\_I01[1:0] selects CS2 I/O drive strength
  - 0: 8 mA
  - 2: 6 mA
  - 1: 4 mA
  - 3: 2 mA

### 7.5.1.16 Force MPU Writes to Be Nonposted

MPUFORCEWRNP bit CONTROL.CONTROL\_DEVCONF1[9] bit is for debugging only. When this bit is set to 1 (for debugging), all writes are forced to nonposted and the cache attributes are ignored. By default, this bit should be set to 0 (posted writes). For the best performance, keep this bit at 0.

## 7.5.2 Extended-Drain I/Os and PBIAS Cell Programming Guide

**NOTE:** The device can be supplied by an external power IC. Texas Instruments provides such a global solution to its customers with the TPS65950 power IC. Contact your TI representative for more information on the TPS65950 power IC.

If the device is associated with the TPS65950 power IC, before using MMC/SD/SDIO1 or USIM interfaces, the software must program the TPS65950 to enable the VMMC1 or VSIM (for MMC/SD/SDIO1 module), LDO and to provide a 1.8-V/3.0-V voltage. This is done by software via the I<sup>2</sup>C interface that links the device and TPS65950 IC.

If the application does not want the MMC/SD/SDIO1 interface running at 3.0 V, software users must then assert the VMODE signal to low for 1.8-V activity: in this case, the PBIAS is connected to ground (see [Figure 7-24](#)).

[Table 7-73](#) lists the control signal with the corresponding control bits from the CONTROL.CONTROL\_PBIAS\_LITE (physical address: 0x4800 2520) register to configure the PBIAS and the extended drain I/O cells. These signals can be software controlled.

**Table 7-73. Control Signals**

Control Signals Name	Bit Register for MMC/SD/SDIO1 Module using PBIAS0 cell	Bit Register for MMC/SD/SDIO1 Module using PBIAS1 cell	Reset Value
PWRDNZ	CONTROL.CONTROL_PBIAS_LITE[1] PBIASLITEPWRDNZ0 bit	CONTROL.CONTROL_PBIAS_LITE[9] PBIASLITEPWRDNZ1 bit	0
VMODE	CONTROL.CONTROL_PBIAS_LITE[0] PBIASLITEVMODE0 bit	CONTROL.CONTROL_PBIAS_LITE[8] PBIASLITEVMODE1 bit	1
SUPPLY_HIGH	CONTROL.CONTROL_PBIAS_LITE[7] PBIASLITESUPPLYHIGH0 bit	CONTROL.CONTROL_PBIAS_LITE[15] PBIASLITESUPPLYHIGH1 bit	0
SPEEDCTRL	CONTROL.CONTROL_PBIAS_LITE[2] PBIASLITESPEEDCTRL0 bit	CONTROL.CONTROL_PBIAS_LITE[10] PBIASLITESPEEDCTRL1 bit	0

**Table 7-73. Control Signals (continued)**

Control Signals Name	Bit Register for MMC/SD/SDIO1 Module using PBIAS0 cell	Bit Register for MMC/SD/SDIO1 Module using PBIAS1 cell	Reset Value
VMODEERROR	CONTROL.CONTROL_PBIAS_LITE[3] PBIASLITEVMODEERROR0 bit	CONTROL.CONTROL_PBIAS_LITE[11] PBIASLITEVMODEERROR1 bit	0

The PBIAS cell supports two ranges of I/O VDDS: 1.8 V, typical for low-voltage applications, and 3.0 V, typical for high-voltage applications. For each supply voltage range, the cell generates suitable bias voltage (PBIAS) for extended-drain PMOS devices.

**CAUTION**

The PBIAS cell must be programmed according to peripheral power supply voltage. Refer to [Table 7-74](#)

**Table 7-74. Voltage Configuration<sup>(1)</sup>**

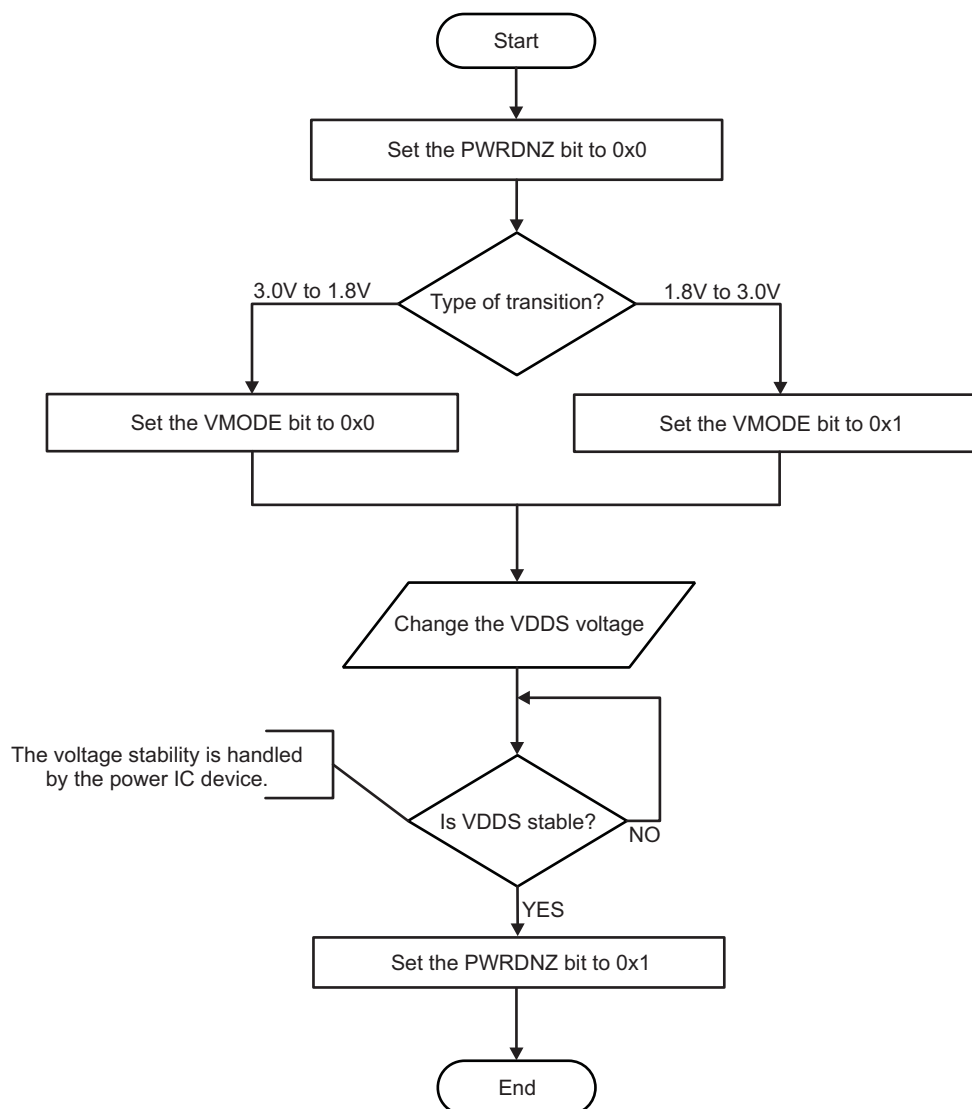

PBIASLITEVMODE Configuration	VDDS Voltage	Reset Value
1.8 V	1.8 V	Normal 1.8-V operation
1.8 V	3.0 V	Damaging configuration <sup>(2)</sup>
3.0 V	1.8 V	Degraded functionality <sup>(2)</sup>
3.0 V	3.0V	Normal 3.0-V operation

<sup>(1)</sup> For damaging configuration, hardware system protection is provided to prevent deterioration of the associated extended drain I/Os.

<sup>(2)</sup> It is forbidden to use these modes.

Figure 7-24 describes the programming flow to go from 3.0 V to 1.8 V, and vice versa.

**Figure 7-24. Flowchart**

108-019

The PBIAS output is the same as VDDS when the PWRDNZ bit is LOW. Once the VDDS supply settles, the software releases the PWRDNZ (pulls it HIGH). This then starts up the PBIAS cell work to generate the PBIAS voltage. During the complete process the MMC/SD/SDIO1 I/O cannot be used for transmitting data.

---

**NOTE:** In the case of a damaging configuration, hardware system protection prevents deterioration of the associated extended-drain I/Os.

---

### CAUTION

The following are critical requirements for the cell:

- The VMODE bit must be defined before the PWRNDZ bit is made HIGH (cell is brought out of PWRNDZ).
- The default state of VMODE bit must be HIGH (to indicate 3.0-V operation).
- PWRNDZ bit must be kept LOW whenever the VDDS supply is ramping up (PWRNDZ bit is not required to be kept LOW during ramp down of the supply). This could be damaging.

#### 7.5.2.1 PBIAS Error Generation

Table 7-75 summarizes the generation of the PBIAS error interrupt (PBIAS0\_ERROR and PBIAS1\_ERROR) depending on the various CONTROL.CONTROL\_PBIAS\_LITE bits control. The row highlighted in grey is a potential condition that could cause potential reliability issue if not detected. To prevent this reliability issue, the PBIAS voltage is kept a VDDS level when the PBIAS error signal is HIGH.

**Table 7-75. PBIAS Error Signal Truth Table**

VMODE	PWRNDZ	SUPPLY_HIGH	PBIAS ERROR
X	X	X	0
0	0	X	0
0	1	0	0
0	1	1	1
X	1	X	1
1	0	X	0
1	1	0	1
1	1	1	0

**NOTE:** PBIAS ERROR = 1: VMODE level not same as SUPPLY\_HIGH

PBIAS ERROR = 0: VMODE level same or VMODE not considered

The PBIAS error are merged and connected to the MPU Subsystem interrupt controller.

The CONTROL.CONTROL\_PBIAS\_LITE[i] VMODEERROR bits (with i=3 or 11) also indicates if this kind of error occurs.

#### 7.5.2.2 Critical Timing Requirements

It is crucial that the PWRNDZ bit is de-asserted (made 1 from 0) only after MMC\_VDDS/SIM is stable. The cells support the cases when VDD2 ramps up before VDDS, or when VDDS ramps up before VDD2. However, MMC\_VDDS/SIM must come up after both VDD2 and VDDS.

Figure 7-25 shows the expected behavior of PWRNDZ bit with regard to supply ramp up. Figure 7-25 shows the case when VDDS ramps up before VDD2.

**Figure 7-25. VDDS Ramps Up Before VDD2**

- A These timing requirements are applicable only when MMC\_VDDS/SIM is 3.0 V. If MMC\_VDDS/SIM is 1.8 V, VDDS and MMC\_VDDS/SIM can be ramped up simultaneously.

### 7.5.2.3 Speed Control and Voltage Supply State

There are two other control bits in the CONTROL.CONTROL\_PBIAS\_LITE register:

- SPEEDCTRL bit can be used to reduce dynamic current if fast rise/fall times are not needed.
- SUPPLYHIGH bit signal is used to inform the cell on the value of VDDS signal. (0b0 = 1.8 V and 0b1 = 3.0 V)

### 7.5.3 OFF Mode Preliminary Settings

The following actions must be performed once, and remain valid for all device OFF <-> ON transitions:

- Program a valid device OFF pads configuration, by setting all OFF mode values bits in the CONTROL\_PADCONF\_X registers: OFFPULLTYPESELECT (OFF mode pull type), OFFPULLUDENABLE (OFF mode pull enabling), OFFOUTVALUE (OFF mode output value), OFFOUTENABLE (OFF mode output enabling), and OFFENABLE (OFF mode pad state override control) .
- Program a valid device ACTIVE pads configuration by setting pertinent bits in each CONTROL.CONTROL\_PADCONF\_X register (see [Section 7.5.4, Pad Configuration Programming Points](#)).
- Perform a device ACTIVE pads configuration saving in the save and restore memory from Wake-up Control Module by asserting the STARTSAVE bit CONTROL.CONTROL\_PADCONF\_OFF[1].
- Set the SCM in smart idle mode by setting the IDLEMODE field CONTROL.CONTROL\_SYSCONFIG[4:3] (this will ensure that its clocks can not be cut until the save procedure has completed).
- Enable/disable the wake-up event detection capability of the pads by setting the WAKEUPENABLE bit CONTROL.CONTROL\_PADCONF\_X.

---

**NOTE:** When the wake-up detection is enabled for a pad, this pad is configured as input. So do not forget to write 0b1 in the OFFOUTENABLE bit CONTROL.CONTROL\_PADCONF\_X to disable the output capability.

---

For further information, see the *Power, Reset and Clock Management* chapter.

### 7.5.4 Pad Configuration Programming Points

To configure the pad, ensure that the following are done:

- Identify signals required on the interface based on the target application.  
Example: You want to configure UART1 interface on balls. The required signals are: uart1\_tx, uart1\_rts, uart1\_cts, and uart1\_rx.
- Choose the pads used for those signals. Some signals could be available on several pads and/or may be multiplexed with other signals that can be need for an other application. Refer to [Section 7.4.4.3, Pad Multiplexing Register Fields](#).  
Example: Each UART1 interface signals are available on two pads. These signals are multiplexed with a McBSP signal.

Assume that the McBSP interface is required in the system. Therefore, for the UART1 interface signals, pads must be used where those signals are not multiplexed with the McBSP signal.

- Identify the pad configuration registers associated to the pads you will use in your application. Refer to [Section 7.4.4.3, Pad Multiplexing Register Fields](#).

Example: With the previous hypothesis the pad configuration registers to program are:

- uart1\_cts: CONTROL.CONTROL\_PADCONF\_DSS\_DATA0[15:0]
- uart1\_rts: CONTROL.CONTROL\_PADCONF\_DSS\_DATA0[31:16]
- uart1\_tx: CONTROL.CONTROL\_PADCONF\_DSS\_DATA6[15:0]
- uart1\_rx: CONTROL.CONTROL\_PADCONF\_DSS\_DATA6[31:16]

---

**NOTE:** In that configuration, dss\_datan (where n = 0) signals will not be available on these balls.

---

- Configure the MUXMODE field of each pad configuration registers (CONTROL.[CONTROL\\_PADCONF\\_X](#)) associated to the pads used. [Section 7.4.4.3, Pad Multiplexing Register Fields](#) lists the entire mode available for each pin. Write the binary value of the mode used in the MUXMODE field of the pad configuration registers.

Example: UART1 signals are available in mode 2. So you should write 0b010 in the corresponding MUXMODE field of pad configurations registers to program.

- Configure the pull of the pad when you use it as input. When the pad is used as output the pull is automatically disabled. [Section 7.4.4.3, Pad Multiplexing Register Fields](#) lists the pull available on each pad and its reset value. Set the appropriate value for PULLTYPESELECT bit of the pad configuration register to set the pull value (0b0 = Pull Down selected, 0b1 = Pull Up selected) and set the PULLUDENABLE bit of the pad configuration register to enable the pull on the pad (0b0 = pull disabled, 0b1 = pull enabled)

Example: uart1\_rts and uart1\_tx are output signals, so the pull will be automatically disabled on the pad. uart1\_cts and uart1\_rx are input signals, so you should configure the pull for these pads:

- uart1\_cts: enable pull-up (write 0b1 in the PULLTYPESELECT bit and 0b1 in the PULLUDENABLE bit of the corresponding pad configuration register)
- uart1\_rx: enable pull-up (write 0b1 in the PULLTYPESELECT bit and 0b1 in the PULLUDENABLE bit of the corresponding pad configuration register)

- Set the INPUTENABLE bit of the pad configuration register if your pin is used as input.

Example: uart1\_rts and uart1\_tx are output signals, so clear the INPUTENABLE bit of the corresponding pad configuration register. uart1\_cts and uart1\_rx are input signals, so set the INPUTENABLE bit of the corresponding pad configuration register.

---

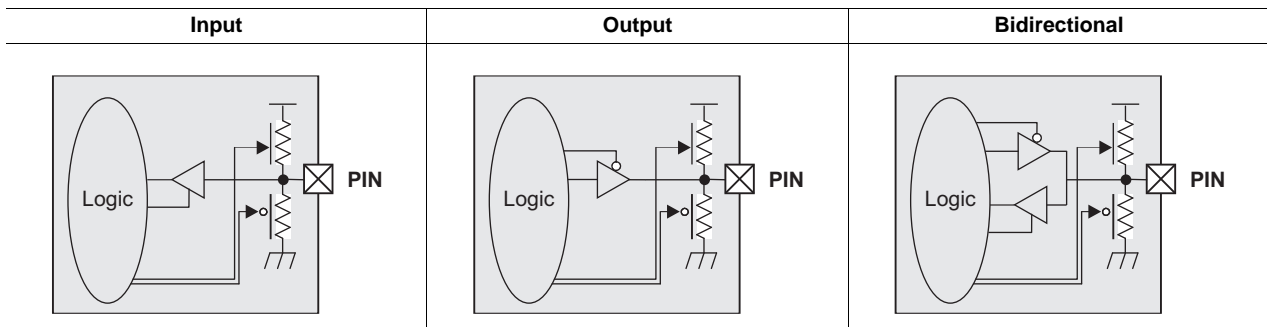

**NOTE:** The order is unimportant for the previous setting of the pad configuration bits.

---

### 7.5.5 I/O Power Optimization Guidelines

In order to optimize I/O power, it is important to avoid unconnected or incorrectly-pulled pins. According to the type of the pins, the way to reduce power consumption can differ. Table 7-76 shows the 3 available pin (or ball) types.

**Table 7-76. Existing Pin Types**

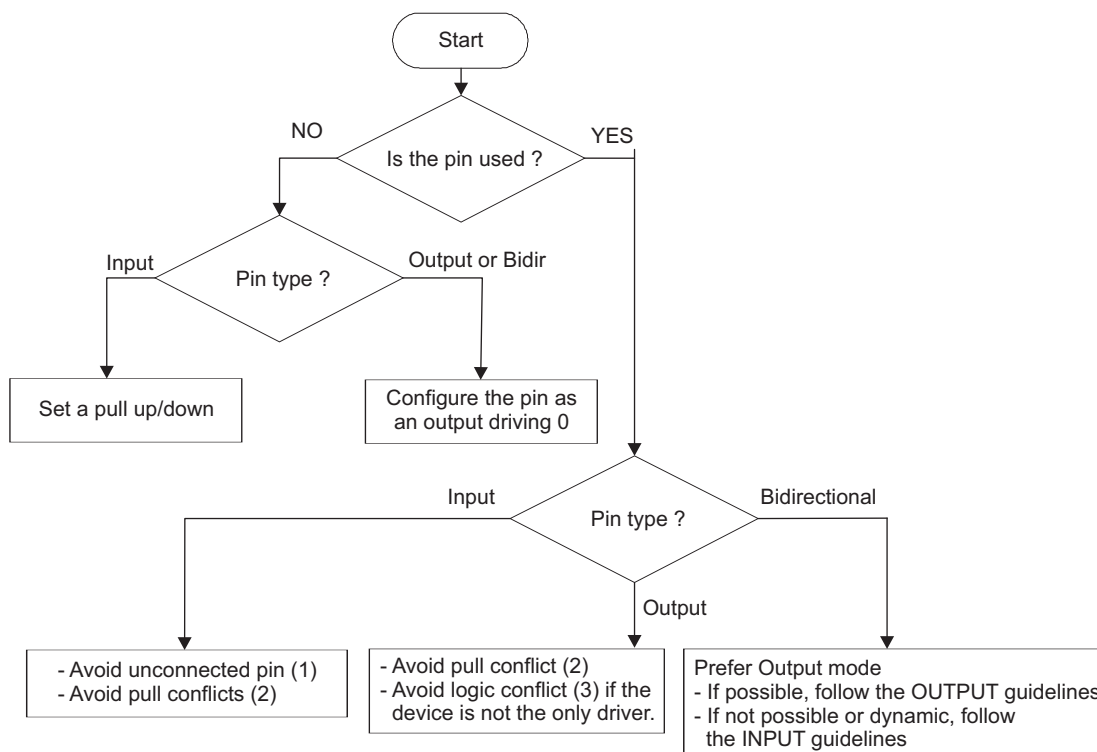

The configuration differs according to the I/O cell types. The following describes some pieces of advice which can be useful to avoid extra current leakage:

- For input pins, use a pull up/down when possible.
  - For output pins, check existing pulls to avoid conflicts.
  - For bidirectional pins, reconfigure the pin as an output driving 0 when possible.
- Some I/O configurations involve modifications during the software setup of I/Os and sometimes require several hardware updates.

Figure 7-26 shows how to optimize the power consumption of pads.

**Figure 7-26. I/O Power Optimization Flowchart**

The following notes give additional explanations about the pin configuration.

1. In order to avoid unconnected pins, the configuration depends on its use:
  - If the pin is not driven externally, a pull up/down is required.
  - Otherwise, a pull up/down is not necessary.
2. Pull conflicts occur when there are different pulls on the same line. In order to correctly configure the pin, avoid external and internal pull together.
3. Logic conflicts consist in different electrical levels at the same time on one line. This can occur when several devices are connected to the same line. The two possible cases are:
  - If no external device drives the line, configure the pin to drive a '0'.
  - If another device drives the line, either the same value has to be driven or the pin has to be disconnected (HZ).

---

**NOTE:** It is advised to use high impedance logical state either on the device or the external component when the line is driven by both components.

---

The I/O pads are software-controlled by:

- Writing to the CONTROL\_PADCONF\_X registers in the Control Module for input/output and pull up/down configuration.
  - Writing to the GPIOi.GPIO\_OE registers in the GPIO module for input/output configuration.
- For more information about how to configure the I/O pads, see [Chapter 7](#), *System Control Module*.

For more information about the GPIO module, see the *General-Purpose Interface* chapter.

---

**NOTE:** For a correct configuration of each pin direction (input, output, bidirectional), both the CONTROL\_PADCONF\_X and the GPIOi.GPIO\_OE registers must be written.

For more information about the I/O cell types and the corresponding optimized configuration, please contact your TI representative.

---

## 7.6 System Control Module Registers

This section gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. Unavailable module and feature pins are not functional.

[Table 7-77](#) lists the base address and address space for the SCM instances.

**Table 7-77. Instance Summary**

Module Name	Base Address	Size
INTERFACE	0x4800 2000	36 bytes
PADCONF	0x4800 2030	564 bytes
GENERAL	0x4800 2270	767 bytes
MEM_WKUP	0x4800 2600	1K byte
PADCONF_WKUP	0x4800 2A00	80 bytes
GENERAL_WKUP	0x4800 2A60	31 bytes

Some register description tables in this section are divided into different device types and ModeSP according to their access rights and reset value. For example, CONTROL.CONTROL\_EXT\_SEC\_CONTROL is divided into seven tables named "TypeAModeB Bitfield Details" where:

- A can take different expressions depending on the device type:
  - E: EMULATOR device
  - G: General-purpose device
  - T: TEST device
  - S: SECURE device
  - B: BAD device
  - X: DON'T CARE device
 These access rights are enumerated in register descriptions as needed.
- B can take different expressions depending on the mpu mode:
  - SP: SECURE PRIVILEGE mode
  - NSP: NON SECURE PRIVILEGE mode
  - X: DON'T CARE mode

### 7.6.1 System Control Module Register Mapping Summary

**NOTE:** All module registers are 8-, 16-, or 32-bit accessible through the L4 interconnect (little endian encoding).

[Table 7-78](#) lists the INTERFACE registers.

**Table 7-78. INTERFACE Registers Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address	Section
CONTROL_REVISION	R	32	0x0000 0000	0x4800 2000	<a href="#">Section 7.6.2.1</a>
CONTROL_SYSCONFIG	RW	32	0x0000 0010	0x4800 2010	<a href="#">Section 7.6.2.2</a>

[Table 7-79](#) lists the PADCONF registers.

**Table 7-79. PADCONF Registers Mapping Summary**

## 7.6.2 INTERFACE Register Descriptions

through [Table 7-85](#) describe the interface register bits.

### 7.6.2.1 CONTROL\_REVISION

**Table 7-84. CONTROL\_REVISION**

<b>Address Offset</b>	0x00	<b>Instance</b>	INTERFACE
<b>Physical address</b>	0x4800 2000		
<b>Description</b>	Control module Revision number		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																REVISION															

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Read returns reset value.	R	0x000000
7:0	REVISION	Revision number	R	-

**7.6.2.2 Control System Configuration Register (CONTROL\_SYSCONFIG)**
**Table 7-85. Control System Configuration Register (CONTROL\_SYSCONFIG)**

<b>Address Offset</b>	0x10	<b>Instance</b>	INTERFACE
<b>Physical address</b>	0x4800 2010		
<b>Description</b>	Set various parameters relative to the Idle mode of the Control module		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																IDLEMODE	ENAWAKEUP	SOFTRESET	AUTOIDLE												

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Read returns reset value.	R	0x0000000
4:3	IDLEMODE	Power Management, req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: Reserved 0x2: Smart-idle. Acknowledgement to an idle request is given based on the internal activity of the module 0x3: Reserved	R/W	0x0
2	ENAWAKEUP	Wake-up enable. Not used in the module	R	0x0
1	SOFTRESET	Software reset. Not used in the module	R	0x0
0	AUTOIDLE	Internal interface clock gating strategy 0x0: Interface clock is free-running 0x1: Automatic interface clock gating strategy is applied, based on the interconnect interface activity	R/W	0x0

### 7.6.3 PADCONFS Register Description

Each 32-bit PADCONF register gathers the configuration of two pads. For example, CONTROL.CONTROL\_PADCONF\_GPMC\_7 is used to configure gpmc\_7 pad (bits [15:0]) and gpmc\_8 pad (bits [31:16]). See [Figure 7-8](#) for more information about PADCONF registers.

According to the pad type, some features are configurable or not. [Table 7-86](#) gives the description of a fully configurable pad.

**Table 7-86. CONTROL\_PADCONF\_X**

<b>Address Offset</b>	0x0000 0000 - 0x0000 05C8		
<b>Physical address</b>	See <a href="#">Table 7-79</a>	<b>Instance</b>	SYSC_PADCONFS
<b>Description</b>	Pad configuration register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WAKEUPEVENT1	WAKEUPENABLE1	OFFPULLTYPE	OFFPULLUDENABLE1	OFFOUTVALUE1	OFFOUTENABLE1	OFFENABLE1	INPUTENABLE1	RESERVED			PULLTYPESELECT1	PULLUDENABLE1	MUXMODE1			WAKEUPEVENT0	WAKEUPENABLE0	OFFPULLTYPESELECT0	OFFPULLUDENABLE0	OFFOUTVALUE0	OFFOUTENABLE0	OFFENABLE0	INPUTENABLE0	RESERVED			PULLTYPESELECT0	PULLUDENABLE0	MUXMODE0		

Bits	Field Name	Description	Type	Reset
31	WAKEUPEVENT1	Pad_x wake-up event status latched in the I/O: 0: No wake-up event occurred 1: A wake-up event occurred	R	0
30	WAKEUPENABLE1	Input pad wake-up enable (and OFF mode input enable value) for pad_x: 0: wake-up detection on is disabled 1: wake-up detection on is enabled	R/W	0
29	OFFPULLTYPESELECT1	Off mode Pull-Up/Down selection for pad_x: 0: Pull-Down selected 1: Pull-Up selected	R/W	0
28	OFFPULLUDENABLE1	Off mode Pull-Up/Down enable for pad_x: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	0
27	OFFOUTVALUE1	Off mode pad_x output value	R/W	0
26	OFFOUTENABLE1	Off mode pad_x output enable value: (Warning: This is an active low signal.) 0: output enabled 1: output disabled	R/W	0
25	OFFENABLE1	Off mode pad_x state override control: 0: Off mode disabled 1: Off mode enabled	R/W	0
24	INPUTENABLE1	Input enable value for pad_x	R/W	1
23:21	RESERVED	Reserved	R	0
20	PULLTYPESELECT1	Pull-Up/Down selection for pad_x: 0: Pull-Down selected 1: Pull-Up selected	R/W	Pad dependent
19	PULLUDENABLE1	Pull-Up/Down enable for pad_x: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	Pad dependent
18:16	MUXMODE1	Functional multiplexing selection for pad_x	R/W	Pad dependent

Bits	Field Name	Description	Type	Reset
15	WAKEUPEVENT0	Pad_y wake-up event status latched in the I/O: 0: No wake-up event occurred 1: A wake-up event occurred	R	Pad dependent
14	WAKEUPENABLE0	Input pad wake-up enable (and OFF mode input enable value) for pad_y: 0: wake-up detection on is disabled 1: wake-up detection on is enabled	R/W	0
13	OFFPULLTYPESELECT0	Off mode Pull-Up/Down selection for pad_y: 0: Pull-Down selected 1: Pull-Up selected	R/W	0
12	OFFPULLUDENABLE0	Off mode Pull-Up/Down enable for pad_y: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	0
11	OFFOUTVALUE0	Off mode pad_y output value	R/W	0
10	OFFOUTENABLE0	Off mode pad_y output enable value: (Warning: This is an active low signal.) 0: Off mode enabled. 1: Off mode disabled	R/W	0
9	OFFENABLE0	Off mode pad_y state override control: 0: Off mode disabled. 1: Off mode enabled	R/W	0
8	INPUTENABLE0	Input enable value for pad_y	R/W	1
7:5	RESERVED	Reserved	R	0
4	PULLTYPESELECT0	Pull-Up/Down selection for pad_y: 0: Pull-Down selected 1: Pull-Up selected	R/W	Pad dependent
3	PULLUDENABLE0	Pull-Up/Down enable for pad_y: 0: Pull-Up/Down disabled 1: Pull-Up/Down enabled	R/W	Pad dependent
2:0	MUXMODE0	Functional multiplexing selection for pad_y	R/W	Pad dependent

**NOTE:** The WAKEUPEVENT1 of the CAM\_D0 register is swapped with the WAKEUPEVENT0 of CAM\_D1.

The OFFOUTENABLE and OFFOUTVALUE bits are functional only if the pad configuration supports output mode on at least one MUXMODE. For a pad that supports only the input feature, the OFFOUTENABLE and OFFOUTVALUE bits cannot be configured (they are don't care and read always returns 0).

**NOTE:** The Bits field gives the field number for the pairs of pads gathered in each register.

Table 7-87 describes the reset values and the corresponding register for each pad.

**NOTE:**

- All '-' assume that the corresponding bit is not available. These bits are considered as Reserved.
- The reset value for Reserved bits is 0.
- In the MUX Reset States column and the PU/PD Reset States column of Table 7-87, a dash (-) indicates that the field is hardwired to logic 0. No corresponding control block ports are implemented for these bits.

## 7.6.4 GENERAL Register Descriptions

Table 7-88 through Table 7-261 describe the GENERAL registers bits.

### 7.6.4.1 CONTROL\_PADCONF\_OFF

**Table 7-88. CONTROL\_PADCONF\_OFF**

<b>Address Offset</b>	0x0000 0000	<b>Instance</b>	GENERAL
<b>Physical address</b>	0x4800 2270		
<b>Description</b>	Off mode pad configuration register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																WKUPCTRLCLOCKDIV		STARTSAVE		FORCEOFFMODEEN											

Bits	Field Name	Description	Type	Reset
31:3	RESERVED	Read returns reset value.	R	0x00000000
2	WKUPCTRLCLOCKDIV	Wkup_ctrl module clock divider 0x0: Clock is divided by 4 0x1: Clock is divided by 2	R/W	0x0
1	STARTSAVE	Start pad configuration registers save mechanism 0x0: Save is not started 0x1: Save is running. This bit is auto-cleared after 8 interface clock cycles.	R/W	0x0
0	FORCEOFFMODEEN	Force OFF mode active 0x0: OFF mode is not forced active 0x1: OFF mode is forced active	R/W	0x0

**7.6.4.2 CONTROL\_DEVCONF0**
**Table 7-89. CONTROL\_DEVCONF0**

<b>Address Offset</b>	0x0000 0004		
<b>Physical address</b>	0x4800 2274	<b>Instance</b>	GENERAL
<b>Description</b>	Static device configuration register-0. Module dedicated functions		
<b>Type</b>	R/W		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								MMCSPIO1ADPCLKISEL	RESERVED								MCBSP2_CLKS	RESERVED	MCBSP1_FSR	MCBSP1_CLKR	MCBSP1_CLKS	SENSDMAREQ1	SENSDMAREQ0								

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Reserved bits	R/W	0x00
26	RESERVED	Reserved bit	R/W	0x1
25	RESERVED	Reserved bit	R/W	0x0
24	MMCSPIO1ADPCLKISEL	MMC/SDIO Module Input Clock selection 0x0: Input clock is from the external pin 0x1: Internal loop-back, module input clock is copied from the module output clock	R/W	0x0
23:7	RESERVED	Read returns reset value	R	0x000
6	MCBSP2_CLKS	Select the CLKS input for the module McBSP2  Note : There are no external pins McBSP2_CLKR and McBSP2_FSR for the module McBSP2. For this module, CLKR input is from the pin McBSP2_CLKX and FSR input is from the pin McBSP2_FSX 0x0: CLKS is from the PRCM functional clock 0x1: CLKS is from the external pin McBSP_CLKS	R/W	0x0
5	RESERVED	Read returns reset value.	R	0
4	MCBSP1_FSR	Select the FSR input for the module McBSP1 0x0: FSR is from the pin McBSP1_FSR 0x1: FSR is from the pin McBSP1_FSX	R/W	0x0
3	MCBSP1_CLKR	Select the CLKR input for the module McBSP1 0x0: CLKR is from the pin McBSP1_CLKR 0x1: CLKR is from the pin McBSP1_CLKX	R/W	0x0
2	MCBSP1_CLKS	Select the CLKS input for the module McBSP1 0x0: CLKS is from the PRCM functional clock 0x1: CLKS is from the external pin McBSP_CLKS	R/W	0x0
1	SENSDMAREQ1	Set sensitivity on SYS.DMAREQ1 input pin 0x0: Level sensitivity 0x1: Edge sensitivity	R/W	0x0
0	SENSDMAREQ0	Set sensitivity on SYS.DMAREQ0 input pin 0x0: Level sensitivity 0x1: Edge sensitivity	R/W	0x0

**7.6.4.3 CONTROL\_MEM\_DFTRW0**
**Table 7-90. CONTROL\_MEM\_DFTRW0**

<b>Address Offset</b>	0x0000 0008	<b>Instance</b>	GENERAL
<b>Physical address</b>	0x4800 2278		
<b>Description</b>	DFT Read and Write Controls for memory blocks		
<b>Type</b>	R/W		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MEMORY4DFTGLXCTRL	MEMORY3DFTGLXCTRL	MEMORY2DFTWRITECTRL	MEMORY2DFTREADCTRL	RESERVED	MEMORY1DFTWRITECTRL	MEMORY1DFTREADCTRL	MEMORY0DFTGLXCTRL	MEMORY0DFTWRITECTRL	MEMORY0DFTREADCTRL						

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Read returns reset value	R	0X0
15	MEMORY4DFTGLXCTRL	ETB memory DFT GLX ctrl	Refer to <a href="#">Table 7-91</a>	0X0
14	MEMORY3DFTGLXCTRL	WKUP memory DFT GLX ctrl	Refer to <a href="#">Table 7-91</a>	0X0
13:12	MEMORY2DFTWRITECTRL	McBSP2 memory DFT write ctrl	Refer to <a href="#">Table 7-91</a>	0X0
11:10	MEMORY2DFTREADCTRL	McBSP2 memory DFT read ctrl	Refer to <a href="#">Table 7-91</a>	0X0
9	RESERVED	Read returns reset value	R	0X0
8:7	MEMORY1DFTWRITECTRL	IVA memory DFT write ctrl	Refer to <a href="#">Table 7-91</a>	0X0
6:5	MEMORY1DFTREADCTRL	IVA memory DFT read ctrl	Refer to <a href="#">Table 7-91</a>	0X0
4	MEMORY0DFTGLXCTRL	SGX_ss memory DFT GLX ctrl	Refer to <a href="#">Table 7-91</a>	0X0
3:2	MEMORY0DFTWRITECTRL	SGX_ss memory DFT write ctrl	Refer to <a href="#">Table 7-91</a>	0X0
1:0	MEMORY0DFTREADCTRL	SGX_ss memory DFT read ctrl	Refer to <a href="#">Table 7-91</a>	0X0

**Table 7-91. Type Value For CONTROL\_MEM\_DFTRW0 Register**

Field Name	MPU Mode	
	NSP	SP
MEMORY4DFTGLXCTRL	Read returns 0s	R/W
MEMORY3DFTGLXCTRL	Read returns 0s	R/W
MEMORY2DFTWRITECTRL	Read returns 0s	R/W
MEMORY2DFTREADCTRL	Read returns 0s	R/W
MEMORY1DFTWRITECTRL	Read returns 0s	R/W
MEMORY1DFTREADCTRL	Read returns 0s	R/W
MEMORY0DFTGLXCTRL	Read returns 0s	R/W
MEMORY0DFTWRITECTRL	Read returns 0s	R/W
MEMORY0DFTREADCTRL	Read returns 0s	R/W

#### 7.6.4.4 CONTROL\_MEM\_DFTRW1

**Table 7-92. CONTROL\_MEM\_DFTRW1**

<b>Address Offset</b>	0x0000 000C	<b>Instance</b>	GENERAL
<b>Physical address</b>	0x4800 227C		
<b>Description</b>	DFT Read and Write Controls for memory blocks		
<b>Type</b>	R/W		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Field Name	Description	Type	Reset
31	DFTREADWRITEENABLE	Control use of CONTROL_MEM_DFTRWx registers: 0x0: DFT Read/write setting is coming from the Test sub-system 0x1: DFT Read/write setting is coming from the CONTROL_MEM_DFTRWx registers	Refer to <a href="#">Table 7-93</a>	0
30:26	RESERVED	Read returns reset value.	R	0x0
25:24	MEMORY10DFTWRITECTRL	DSI memory DFT write ctrl	Refer to <a href="#">Table 7-93</a>	0x0
23:22	MEMORY10DFTREADCTRL	DSI memory DFT read ctrl	Refer to <a href="#">Table 7-93</a>	0x0
21:20	MEMORY9DFTWRITECTRL	DISP_ss memory DFT write ctrl	Refer to <a href="#">Table 7-93</a>	0x0
19:18	MEMORY9DFTREADCTRL	DISP_ss memory DFT read ctrl	Refer to <a href="#">Table 7-93</a>	0x0
17	MEMORY8DFTGLXCTRL	ISP_ss memory DFT GLX ctrl	Refer to <a href="#">Table 7-93</a>	0x0

Bits	Field Name	Description	Type	Reset
16:15	MEMORY8DFTWRITECTRL	ISP_ss memory DFT write ctrl	Refer to <a href="#">Table 7-93</a>	0x0
14:13	MEMORY8DFTREADCTRL	ISP_ss memory DFT read ctrl	Refer to <a href="#">Table 7-93</a>	0x0
12:11	MEMORY7DFTWRITECTRL	MPU_ss memory DFT write ctrl	Refer to <a href="#">Table 7-93</a>	0x0
10:9	MEMORY7DFTREADCTRL	MPU_ss memory DFT read ctrl	Refer to <a href="#">Table 7-93</a>	0x0
8	MEMORY6DFTGLXCTRL	OCMRAM memory DFT GLX ctrl	Refer to <a href="#">Table 7-93</a>	0x0
7:1	RESERVED	Read returns reset value	R	0x0
0	MEMORY5DFTGLXCTRL	USBHS memory DFT GLX ctrl	Refer to <a href="#">Table 7-93</a>	0x0

**Table 7-93. Type Value For CONTROL\_MEM\_DFTRW1 Register**

Field Name	MPU Mode	
	NSP	SP
DFTREADWRITEENABLE	Read returns 0s	R/OCO
MEMORY10DFTREADCTRL	Read returns 0s	R/W
MEMORY10DFTWRITECTRL	Read returns 0s	R/W
MEMORY9DFTREADCTRL	Read returns 0s	R/W
MEMORY9DFTWRITECTRL	Read returns 0s	R/W
MEMORY8DFTGLXCTRL	Read returns 0s	R/W
MEMORY8DFTREADCTRL	Read returns 0s	R/W
MEMORY8DFTWRITECTRL	Read returns 0s	R/W
MEMORY7DFTREADCTRL	Read returns 0s	R/W
MEMORY7DFTWRITECTRL	Read returns 0s	R/W
MEMORY6DFTGLXCTRL	Read returns 0s	R/W
MEMORY5DFTGLXCTRL	Read returns 0s	R/W

### 7.6.4.5 CONTROL\_MSUSPENDMUX\_0

**Table 7-94. CONTROL\_MSUSPENDMUX\_0**

<b>Address Offset</b>	0x0000 0020	<b>Instance</b>	GENERAL
<b>Physical address</b>	0x4800 2290		
<b>Description</b>	MSuspend Control register: control the use of MSuspend signals at module level

### 7.6.5 MEM\_WKUP Register Descriptions

0x4800 2600 to 0x4800 29FC physical addresses are memories mapped for save and restore location (1Kbytes).

- 0x4800 2600 - 0x4800 2830: non accessible (pad configuration)
- 0x4800 2834 - 0x4800 29FC: user accessible

### 7.6.6 PADCONFS\_WKUP Register Description

Each 32-bit PADCONF register gathers the configuration of two pads. For example, CONTROL.CONTROL\_PADCONF\_GPMC\_7 is used to configure gpmc\_7 pad (bits [15:0]) and gpmc\_8 pad (bits [31:16]). See [Figure 7-8](#) for more information about PADCONF registers.

According to the pad type, some features are configurable or not. [Table 7-86](#) gives the description of a fully configurable pad.

[Table 7-262](#) describes the reset values, the capabilities, and the corresponding register for each pad.

---

**NOTE:**

- All '-' assume that the corresponding bit is not available. These bits are considered as Reserved.
  - The reset value for Reserved bits is 0.
  - In the MUX Reset States and PU/PD Reset States columns of [Table 7-262](#), a dash (-) indicates that the field is hardwired to logic 0. No corresponding control block ports are implemented for these bits.
-

## Memory Management Units (MMUs)

---

---

This chapter describes the memory management units (MMUs).

Topic	Page
8.1 MMU Overview .....	1078
8.2 MMU Integration .....	1079
8.3 MMU Functional Description .....	1082
8.4 MMU Basic Programming Model .....	1094
8.5 MMU Registers .....	1102
8.6 Revision History .....	1120

## 8.1 MMU Overview

The device contains three memory management units (MMUs):

- Microprocessor unit (MPU) MMU
- Camera MMU
- Image Video and Audio accelerator (IVA2.2) MMU

The camera MMU and IVA2.2 MMU share the same architecture and are both described in this chapter. The MPU MMU, which implements a different architecture, is covered in the *ARM® Cortex™-A8 Technical Reference Manual* which can be downloaded via the internet at <http://infocenter.arm.com>.

---

**NOTE:** The MMUn prefix provides information about the register instantiation, where n = 1 for the camera MMU, and n = 2 for the IVA2.2 MMU.

---

The MMU instances include the following main features:

- N entries fully associative translation look-aside buffer (TLB) with N = 8 for the camera MMU and N = 32 for the IVA2.2 MMU
- 1 interrupt line out to the MPU subsystem
- 32-bit virtual addresses, 32-bit physical address
- Mapping size: 4KB and 64KB pages, 1MB section, and 16MB supersection
- Predefined (static) or table-driven (hardware table walker) software translation strategies

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

Figure 8-1 shows the MMU instances in the device.

**Figure 8-1. MMU Instances**

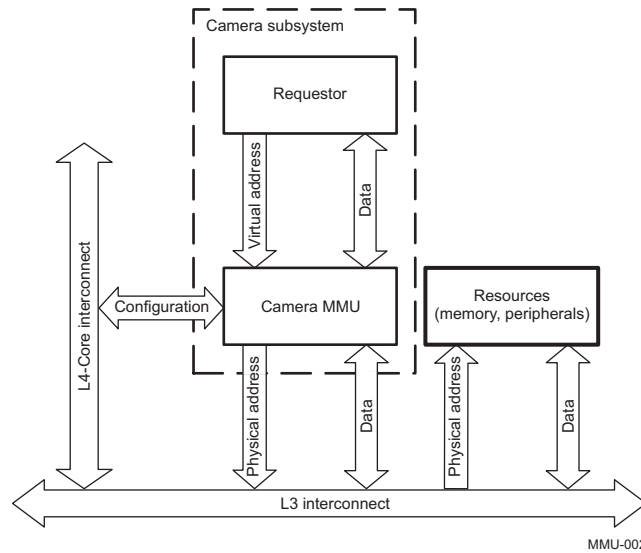

## 8.2 MMU Integration

The MMU communicates accesses from the requestor (either the camera subsystem or the IVA2.2) to the L3 main interconnect, performing virtual to physical address translation. The camera MMU is programmed through the L4-core interconnect. The IVA2.2 MMU is programmed through the L3 interconnect. Both MMU error conditions are signaled as interrupts to the system master processor (that is, the MPU).

Figure 8-2 and Figure 8-3 show the system integration of the camera MMU instance and the IVA2.2 MMU instance.

**Figure 8-2. Camera MMU System Integration**

**Figure 8-3. IVA2.2 MMU System Integration**

### 8.2.1 Clock Domains

The camera MMU instance has two clock domains: the functional clock domain for the MMU, which is synchronous to the L3 interconnect clock, and the L4 interconnect clock, which is used to configure the MMU instance. Both camera MMU clocks are derived from a common reference clock generated by the power reset and clock management (PRCM) module.

The IVA2.2 MMU instance has only one clock domain: the functional clock domain for the MMU. The IVA MMU clock is generated by the DPLL2 embedded in IVA2.2, but controlled by PRCM registers.

## 8.2.2 Power Management

The processor's functional units are grouped into power domains. Each power domain is a section of the device with independent and dedicated power rails. Fifteen different power domains exist. For information about the device's power management, see the *Power, Reset, and Clock Management* chapter.

The MMU instances belong to different power domains. [Table 8-1](#) shows the correspondence between the MMU instance and power domains.

**Table 8-1. Power Domains of the MMU Instances**

MMU Instance	Power Domain
MMU1 (camera MMU)	CAM
MMU2 (IVA2.2 MMU)	IVA2

### 8.2.2.1 System Power Management

As part of the device's system-wide power management scheme, each MMU instance supports a communication protocol with the PRCM module that allows the PRCM module to request an MMU instance to enter a low-power state. When the MMU instance acknowledges a low-power mode request from the PRCM module, the clock to the instance is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock gating method in the local power management.

The MMU instance can be configured through the MMUn.MMU\_SYSCONFIG[4:3] IDLEMODE field as one of the following acknowledgement modes:

- No-idle mode: The MMU instance never enters the idle state.
- Force-idle mode: The MMU instance immediately enters the idle state after receiving a low-power mode request from the PRCM module. In this mode, the software must ensure that there are no pending interrupts before requesting this mode to go into the idle state; otherwise, an error can occur.
- Smart-idle mode: After receiving a low-power mode request from the PRCM module, the MMU instance enters the idle state only after all interrupts are acknowledged.

[Table 8-2](#) describes the MMU power management modes. For details, see the MMU\_SYSCONFIG register.

**Table 8-2. Power Domains of the MMU Instances**

Power Management Mode Requested by the PRCM	MMUn.MMU_SYSCONFIG[4:3] IDLEMODE field
Force-idle	00
No-idle	01
Smart-idle	10
Reserved	11

### 8.2.2.2 Module Power Saving

To conserve power, the MMU instance supports an automatic idle mode whenever activity is not detected on the configuration register port of the MMU instance. The automatic idle mode is enabled or disabled through the MMUn.MMU\_SYSCONFIG[0] AUTOIDLE bit.

If the MMUn.MMU\_SYSCONFIG[0] AUTOIDLE bit is asserted, the automatic idle mode is enabled when activity is not detected on the configuration register port, and the MMU instance clock is disabled internally to the module, thereby reducing power consumption.

When new activity is detected on the configuration register port, the clock is restarted with no latency penalty. After reset, the automatic idle mode is disabled; therefore, it is recommended to enable the automatic idle mode to reduce power consumption.

### 8.2.3 Reset

The MMU instances are reset together with their respective reset domains. [Table 8-3](#) shows the correspondence between the MMU instances and the reset domains.

**Table 8-3. Reset Domains of the MMU Instances**

MMU Instance	Reset Domain
MMU1 (camera MMU)	CAM_RST
MMU2 (IVA2.2 MMU)	IVA_RST2

Software reset is applied when the MMUn.MMU\_SYSCONFIG[1] SOFTRESET is set to 1. The MMUn.MMU\_SYSSTATUS[0] RESETDONE bit can be polled to know the reset status.

When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

---

**NOTE:** IVA2.2 MMU can be accessed from the L3 interconnect (configuration registers) even if the DSP is still under reset (IVA\_RST1 active).

---

### 8.2.4 Interrupts

Each MMU instance can generate an interrupt to the MPU on the occurrence of the following predefined set of events:

- Multi-hit fault  
There is more than one TLB entry for the given virtual address.
- Table walk fault  
A table walk data read generated an error.
- Emulation miss  
A TLB miss was caused by an emulation access.
- Translation fault  
No translation is found for the given virtual address. The hardware table walker is enabled but no valid page table entry exists for the requested address.
- TLB miss with table walk disabled  
No translation is found in the TLB for the given virtual address and the table walking logic is disabled.

Each of these events can be individually enabled and disabled using the MMUn.MMU\_IRQENABLE register. If an event occurs and is enabled, an interrupt is generated to the MPU. The MPU can use the MMUn.MMU\_IRQSTATUS register to find the precise cause of the interrupt.

The MMUn.MMU\_FAULT\_AD register holds the virtual address of the translation that causes the interrupt. The MMUn.MMU\_EMU\_FAULT\_AD indicates the address of the last emulation event causing an MMU interrupt.

[Table 8-4](#) shows the generated interrupt versus the MMU instance.

**Table 8-4. Interrupts of the MMU Instances**

MMU Instance	MMU Interrupt Name	MMU Interrupt Mapping
MMU1 (camera MMU)	CAM_IRQ0	M_IRQ_24
MMU2 (IVA2.2 MMU)	IVA2_MMU_IRQ	M_IRQ_28

---

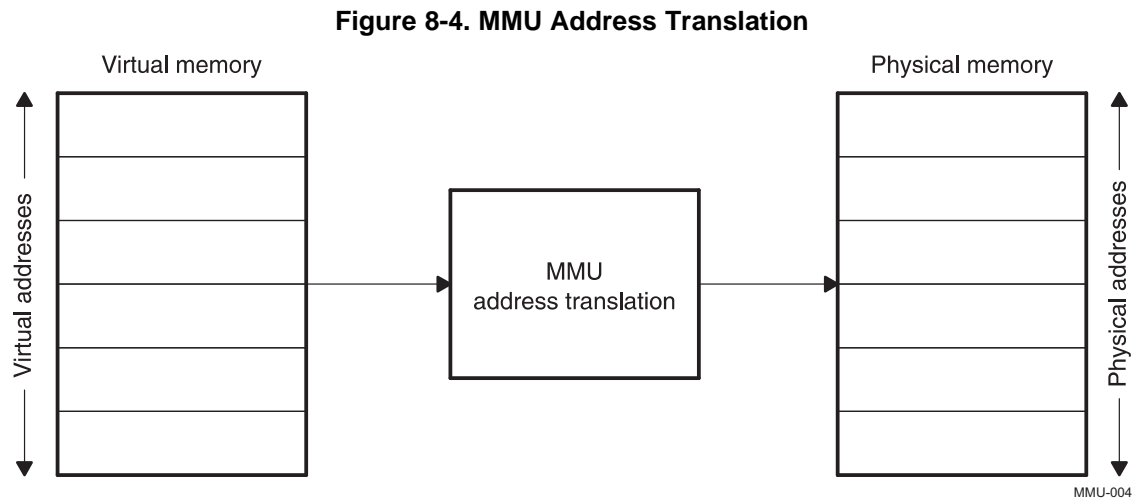

**NOTE:** The IVA2\_MMU\_IRQ (MMU2 instance) interrupt is a dedicated interrupt to the MPU subsystem.  
The *Camera Subsystem* and the *IVA2.2 Subsystem* chapters outline details about interrupt generation in the camera and IVA2.2 subsystems. For details about the MPU interrupt scheme, see the *Interrupt Controller* chapter.

---

### 8.3 MMU Functional Description

The MMUs handle the translation from virtual into physical addresses. The requestor (either the camera subsystem or the DSP mega cell or the EDMA module for IVA2.2) issues virtual addresses to the respective MMU (MMU1 for the camera subsystem and MMU2 for the IVA2.2). The MMU translates these virtual addresses into physical addresses to access the actual resource (memory) when the MMU instance is enable. That is when MMUn.MMU\_CNTL[1] MMUENABLE is set to 1. MMU does not translate the virtual address into physical address when MMU is disabled. When MMUn.CNTL[1].MMUENABLE is cleared to 0, the physical address is the same as the virtual address.

Figure 8-4 shows the relationship between the physical address, the virtual address, and the MMU.

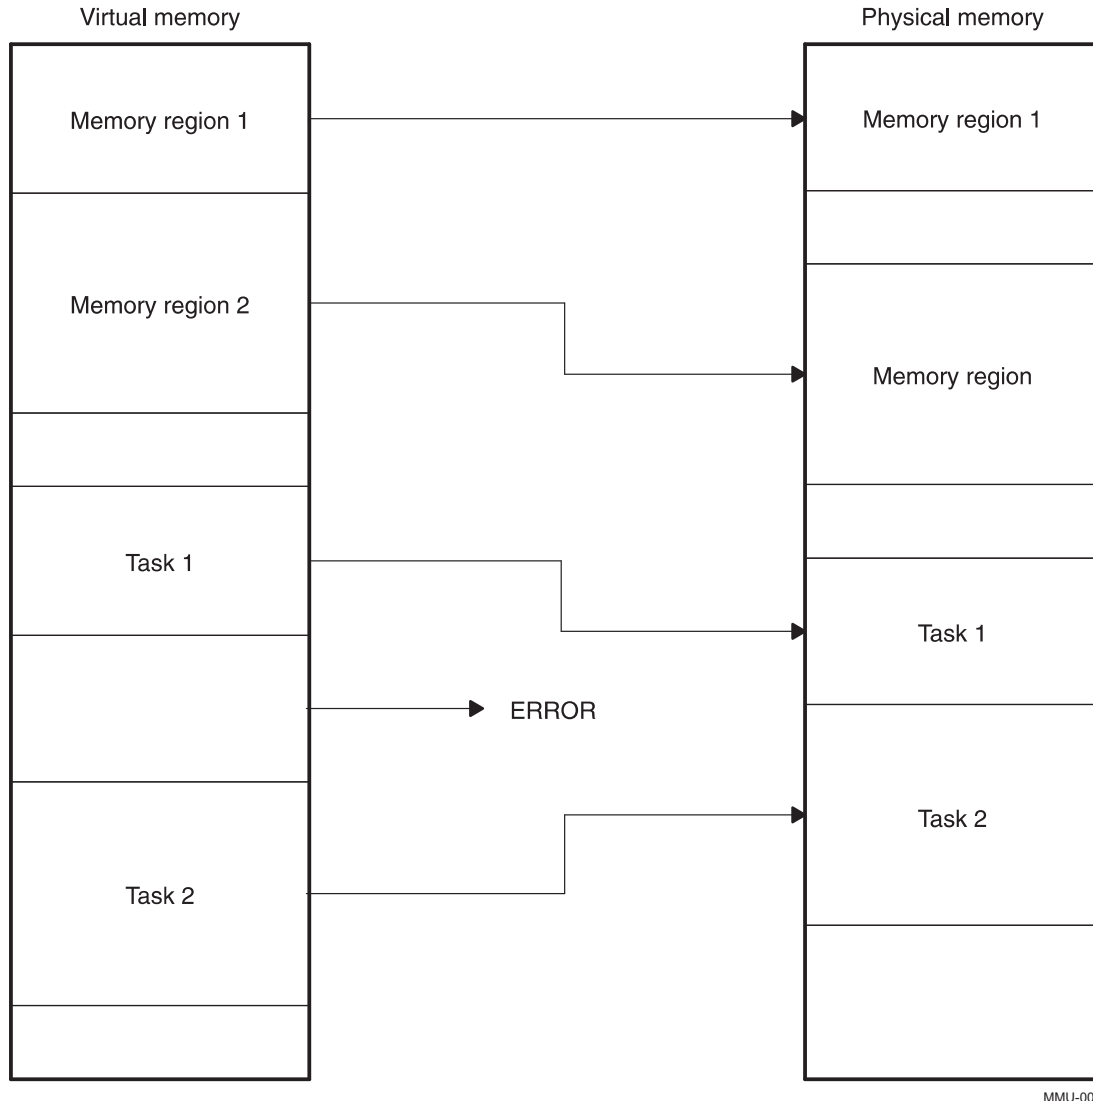

#### 8.3.1 MMU Benefits

The MMU offers two major benefits:

- Memory defragmentation: Fragmented physical memory can be translated into contiguous virtual memory without moving data.
- Memory protection: Illegal, that is, non-allowed accesses to memory locations can be detected and prevented.

Figure 8-5 shows two typical MMU use cases.

Figure 8-5. MMU Usage Examples

MMU-005

Figure 8-5 shows two benefits of using an MMU. Memory region 1 and memory region 2 are fragmented in physical memory. Using the MMU, they appear as one contiguous memory region in the virtual memory space.

On the other hand, task 1 and task 2 are located adjacent to each other in physical memory. In systems without an MMU, there is a danger that task 1 can accidentally write into the memory area allocated to task 2 and vice versa. Allocating task 1 and task 2 into two separate virtual memory regions prevents this problem, because a region of unmapped memory separates the two tasks. Any erroneous access to this region results in an error that can be detected easily.

### 8.3.2 MMU Architecture

The MMU translation process is based on translation entries stored in translation tables. One first-level translation table can exist with several optional second-level translation tables.

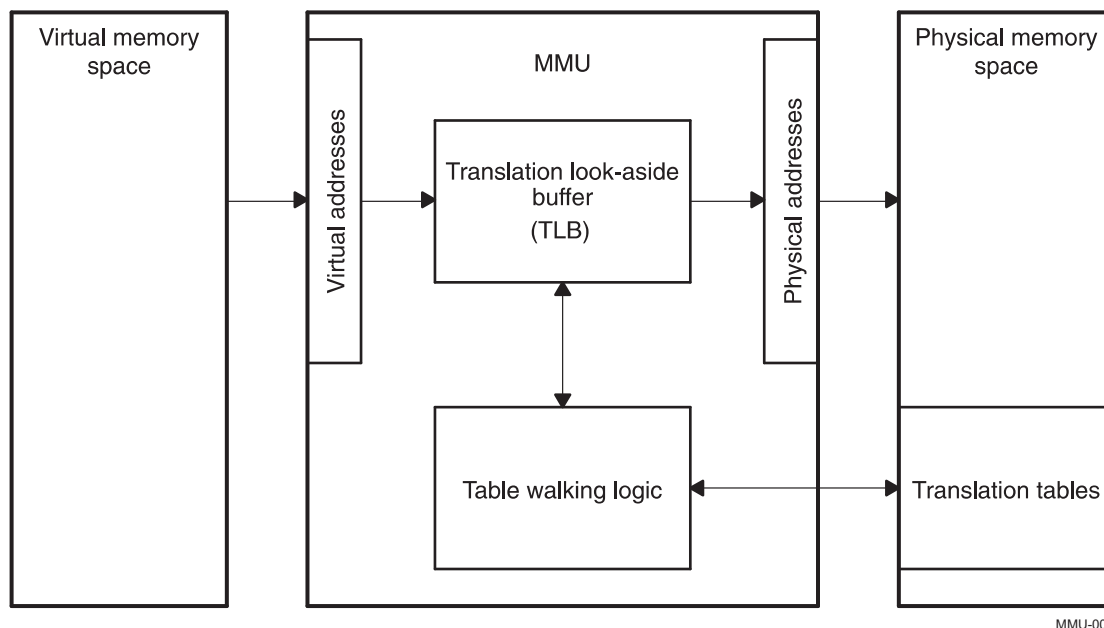

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see [Section 8.3.3, Translation Tables](#).

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. Two-level translation is described later in this chapter.
- The TLB stores recently used translation entries, acting like a cache of the translation table.

This basic architecture is outlined in [Figure 8-6](#).

**Figure 8-6. MMU Architecture**

MMU-006

### 8.3.2.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is already contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. [Figure 8-7](#) summarizes the process.

Figure 8-7. Translation Process

MMU-007

### 8.3.3 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates
- Endianness, data access size, and the mixed property of this memory region

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

#### 8.3.3.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4KB and 64KB pages, a 1MB section, and a 16MB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4KB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4KB memory pages with one translation table would require one million entries to span the entire 4GB address range. The table itself would be 32MB, a size that is not feasible.

However, using bigger pages greatly reduces the functionality of the OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1MB memory regions.

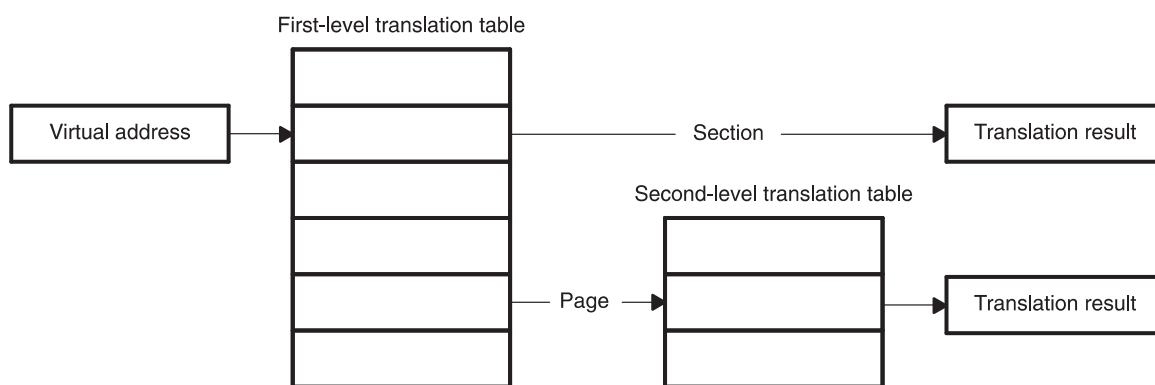

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1MB (section) or 16MB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.

- A pointer to a second-level translation table that specifies individual translation properties based on smaller pages within the 1MB page of memory. These pages can be either 64KB (large page) or 4KB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used. [Figure 8-8](#) shows this hierarchy.

**Figure 8-8. Translation Hierarchy**

MMU-008

The structure of the first and second-level translation tables and their entries are described in more detail in [Section 8.3.3.2, First-Level Translation Table](#), and [Section 8.3.3.3, Two-Level Translation](#).

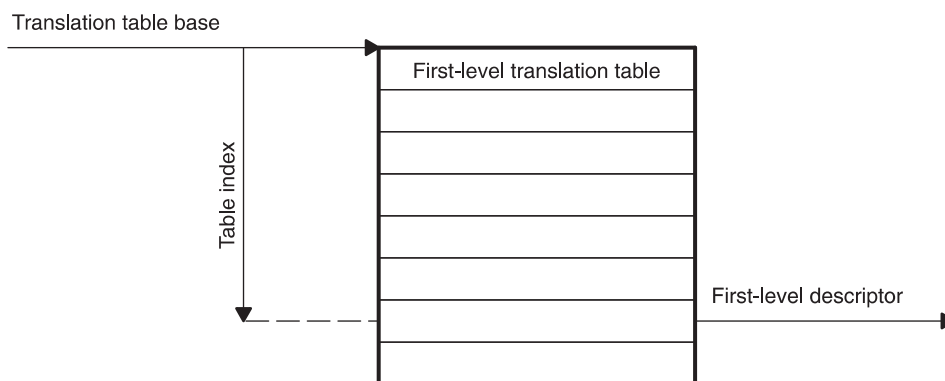

### 8.3.3.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1MB sections. To describe a 4GB address range requires 4096 32-bit entries (so-called first-level descriptors).

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. This mechanism is shown in [Figure 8-9](#).

**Figure 8-9. First-level Descriptor Address Calculation**

MMU-009

To summarize, the translation table base and the translation table index together define the first-level descriptor address. [Figure 8-10](#) outlines the precise mechanism used to calculate this address.

Figure 8-10. Detailed First-level Descriptor Address Calculation

MMU-010

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is  $0x8000:0000 + (0x123 \ll 2) = 0x8000:048C$ .

### 8.3.3.2.1 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1MB or 16MB sections or provides a pointer to a second-level translation table for 4KB or 64KB pages. The first-level descriptor format is shown in Table 8-5.

Table 8-5. First-Level Descriptor Format

First-Level Descriptor Format													
31:24	23:20	19	18	17	16	15	14:12	11:10	9:2	1	0		
X											0	0	Fault
Second-Level Translation Table Base Address									X	0	1	Page	
Section Base Address		X	0	M	X	E <sup>(1)</sup>	X	ES	X	1	0	Section	
Supersection Base Address		X	1	M	X	E	X	ES	X	1	0	Supersection	
X											1	1	Fault

<sup>(1)</sup> See Table 8-21 for endianness limitations.

M = Mixed region: 0 = Page-based access-size, 1 = Access-based access-size

E = Endianness: 0 = Little endian, 1 = Big endian (endianness is locked on little endian)

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

### 8.3.3.2.2 First-Level Page Descriptor Format

If a translation granularity smaller than 1MB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

### 8.3.3.2.3 First-Level Section Descriptor Format

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1MB section or a 16MB supersection.

**NOTE:** Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1MB of memory. If an access points to a descriptor which is not initialized, MMU will behave in an unpredictable way.

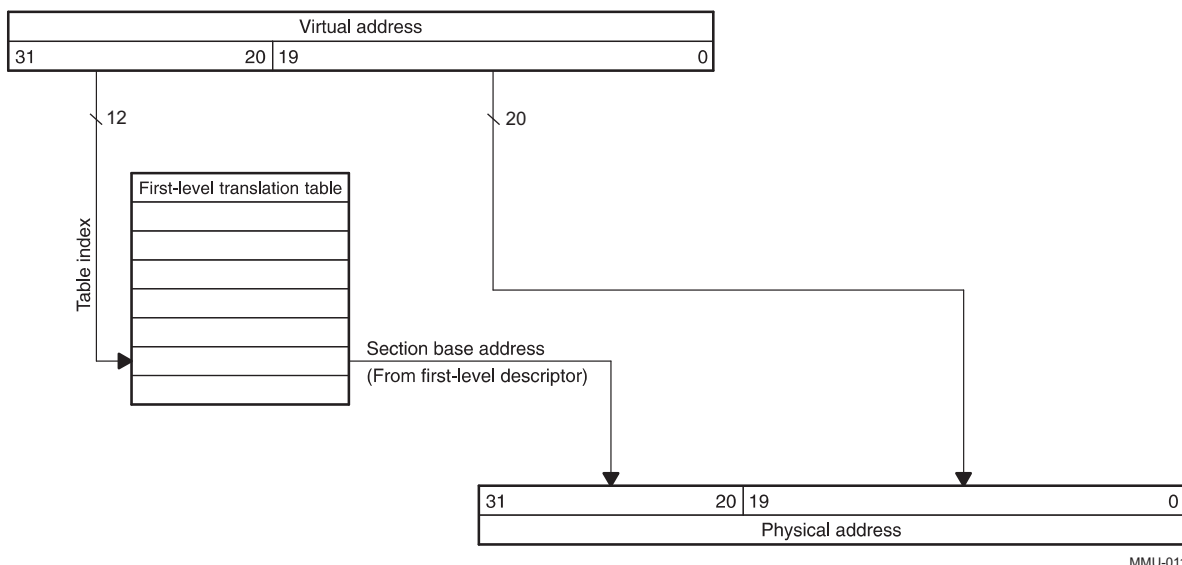

In addition to the address translation itself, three parameters are specified in the section descriptors:

- **Endianness**  
The *endianness* parameter specifies whether the memory section uses a big- or little-endian data format. This parameter is locked to little endian. See [Table 8-21](#) for more information.
- **Element size**  
The *element size* parameter can optionally specify the data access size (8, 16, or 32 bits) for all data items in the defined section.
- **Mixed region**  
The *mixed region* parameter specifies whether the information about the data access size is detected from the access itself (access-based detection) or if the specified element size parameter is used (page-based detection). For example, the specified element size parameter can be used when several smaller sized accesses are packed into a bigger sized access, such as two 16-bit accesses packed into one 32-bit access. In this case, with no specified data access size, 32 bits would be the access size detected, leading to an incorrect result. To avoid this problem, specify the data access size for the memory section.

### 8.3.3.2.4 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table. [Figure 8-11](#) summarizes the address translation process for a section.

**Figure 8-11. Section Translation Summary**

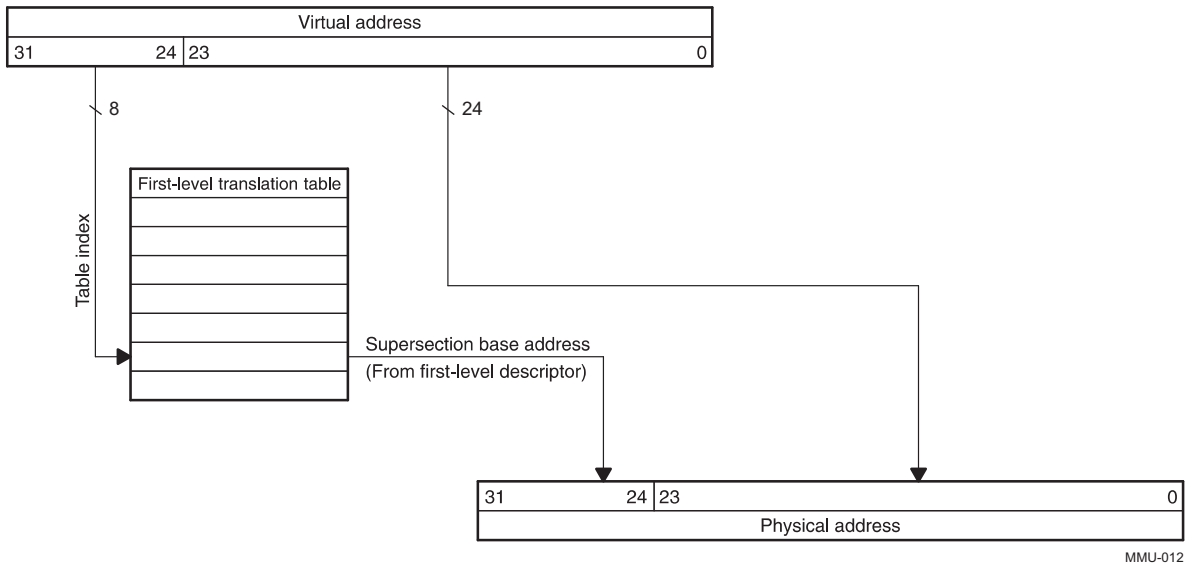

MMU-011

### 8.3.3.2.5 Supersection Translation Summary

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

[Figure 8-12](#) shows the translation mechanism for a supersection.

**Figure 8-12. Supersection Translation Summary**

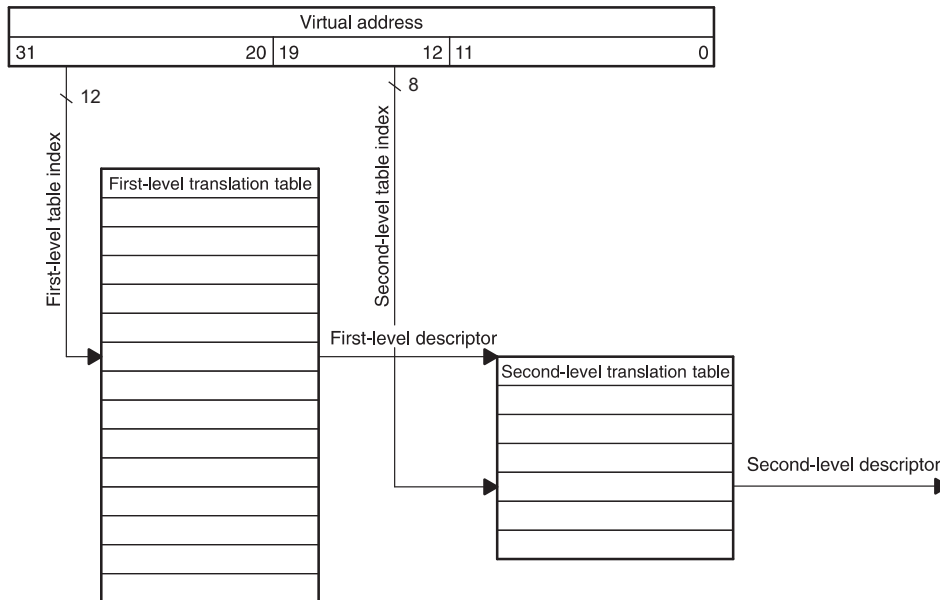

MMU-012

**8.3.3.3 Two-Level Translation**

Two-level translation is used when fine-grain granularity is required, that is when memory sections smaller than 1MB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address. Figure 8-13 shows this indexing mechanism.

**Figure 8-13. Two-Level Translation**

MMU-013

Each second-level translation table describes the translation of 1MB of address space in pages of 64KB (large page) or 4KB (small page). It consists of 256 second-level descriptors describing 4KB each.

**NOTE:** In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor which is not initialized, MMU will behave in an unpredictable way.

### 8.3.3.3.1 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. Table 8-6 shows the format of second-level descriptors. The translation parameters (endianness, element size, and mixed region) have the same meaning as those for sections.

**Table 8-6. Second-Level Descriptor Format**

Second-Level Descriptor Format											
31:16	15:12	11	10	9	8:6	5:4	3:2	1	0		
X									0	0	Fault
Large Page Base Address	X	M	X	E <sup>(1)</sup>	X	ES	X	0	1	Large Page	
Small Page Base Address		M	X	E	X	ES	X	1	X	Small Page	

<sup>(1)</sup> See Table 8-21 for endianness limitations.

M = Mixed region: 0 = Page-based access-size, 1 = Access-based access-Fsize

E = Endianness: 0 = Little-endian, 1 = Big-endian (endianness is locked on little endian)

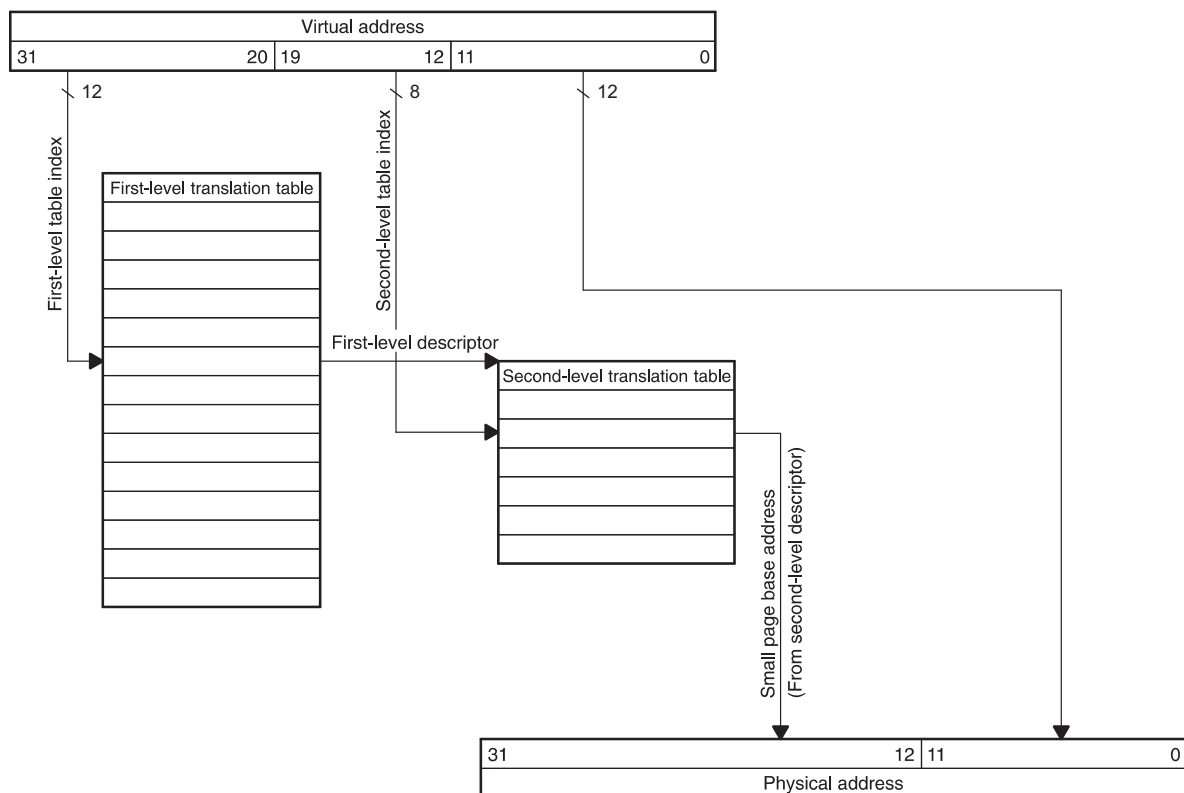

ES = Element Size: 00 = 8-bit, 01 = 16-bit, 10 = 32-bit, 11 = No endianness conversion

X = Don't care

### 8.3.3.3.2 Small Page Translation Summary

Figure 8-14 summarizes the translation process for small pages.

**Figure 8-14. Small Page Translation Summary**

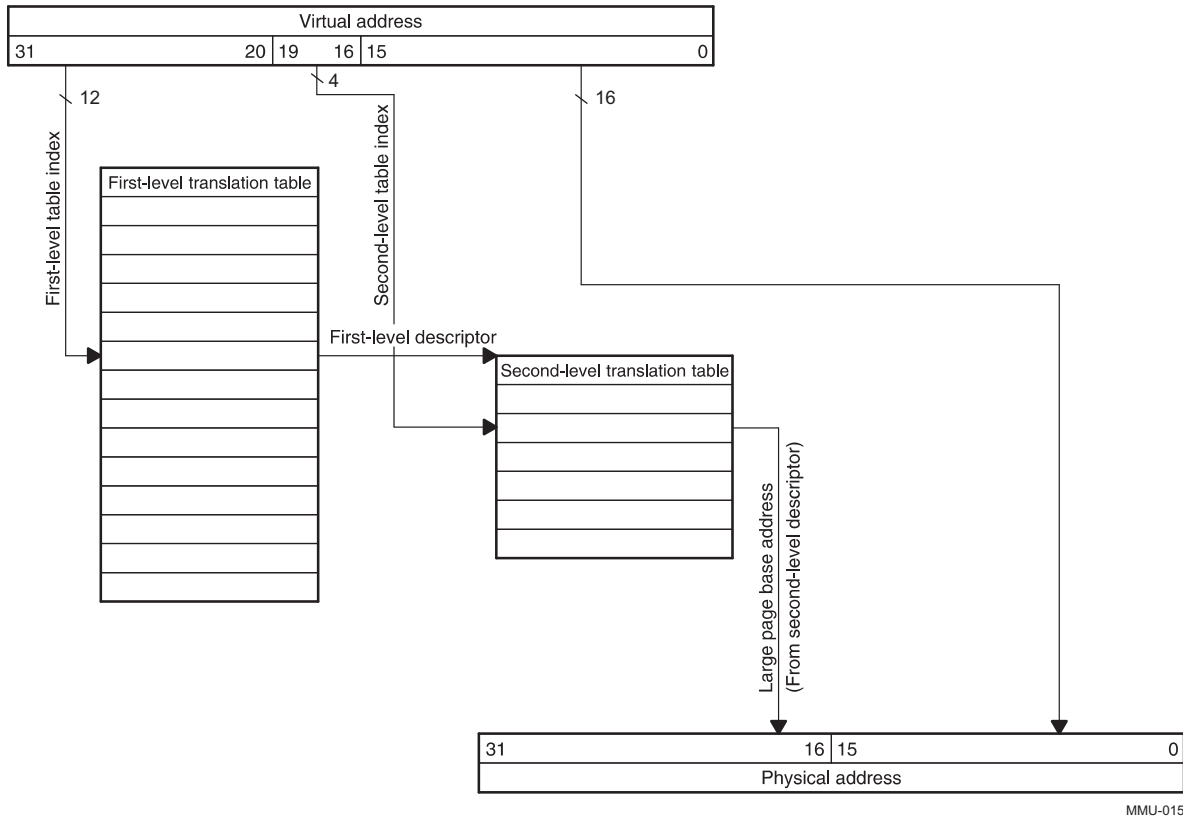

MMU-014

### 8.3.3.3.3 Large Page Translation Summary

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page. This is shown in Figure 8-15.

Figure 8-15. Large Page Translation Summary

MMU-015

### 8.3.4 Translation Lookaside Buffer

Translating virtual to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

The first  $n$  TLB entries, where  $n < \text{Total Number } N \text{ of TLB Entries}$ , can be protected (locked) against being overwritten by setting the TLB base pointer to  $n$ . When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. Figure 8-16 shows an example of TLB with  $N$  TLB entries (ranging from 0 to  $N-1$ ). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

**NOTE:** The last TLB entry (Entry  $N-1$ , where  $N = 8$  for the camera MMU and  $N = 32$  for the IVA2.2 MMU) always remains unprotected.

**Figure 8-16. TLB Entry Lock Mechanism**

MMU-016

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

### 8.3.4.1 TLB Entry Format

TLB entries consist of two parts:

- The CAM part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the MMU\_CAM register table for more details.
- The RAM part contains the address translation that belongs to the virtual address tag as well as the endianness, element size, and mixed parameters described in [Section 8.3.3.2](#). See the MMU\_RAM register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is when MMU\_GFLUSH[0] GLOBALFLUSH is set to 1. Preserved entries must be deleted manually. [Section 8.3.3.2](#) describes the procedure to delete TLB entries.

[Figure 8-17](#) shows the TLB entry structure.

Figure 8-17. TLB Entry Structure

MMU-017

### 8.3.5 MMU Error Handling

The following types of faults can occur:

- TLB miss with table walker disabled  
No translation is found for the virtual address required. If the hardware table walker is disabled, a fault is generated.
- Translation fault  
No translation is found for the virtual address required (TLB miss). The table walker is enabled but a page table entry does not exist for the given virtual address.
- Table walk fault  
A table walk results in a memory read error.
- Multi-hit fault  
More than one valid entry exists in the TLB for the given virtual address.

When a fault occurs and its corresponding interrupt is enabled, an interrupt is signaled to the MPU. The interrupt service routine (ISR) is then responsible for fault recovery. The requestor is stalled by the MMU while the fault is handled. For example, for a TLB miss, the ISR might load the missing entry into the TLB.

The ISR can determine the cause of the fault interrupt by reading the MMU<sub>n</sub>.MMU\_IRQSTATUS register. The virtual address that caused the fault can be determined by reading the MMU<sub>n</sub>.MMU\_FAULT\_AD register.

In the case of a TLB miss, the MMU continues servicing the request as soon as a valid TLB entry is written. In the case of a translation fault, table walk fault, or multi-hit fault, the ISR first addresses the cause of the fault and then releases the MMU by writing to the interrupt status register. The MMU then continues servicing the request.

### 8.3.6 MMU Instance Design Parameters

The various MMU instances have different design parameters, most notably the size of the virtual address space and the number of TLB entries. Table 8-7 shows the correspondence between the MMU instances and the design parameters.

**Table 8-7. Design Parameters of the MMU Instances**

MMU Instance	Virtual Address Space	TLB Entries
MMU1 (camera MMU)	4GB	8 entries
MMU2 (IVA2.2 MMU)	4GB	32 entries

## 8.4 MMU Basic Programming Model

MMU instances handle translation from virtual into physical addresses. Virtual addresses are issued by the Camera or the IVA2.2 subsystems to the MMU, which converts them into physical addresses. These physical addresses correspond to actual memory resource. Refer to the *Memory Mapping* chapter for more information on the device memory mapping.

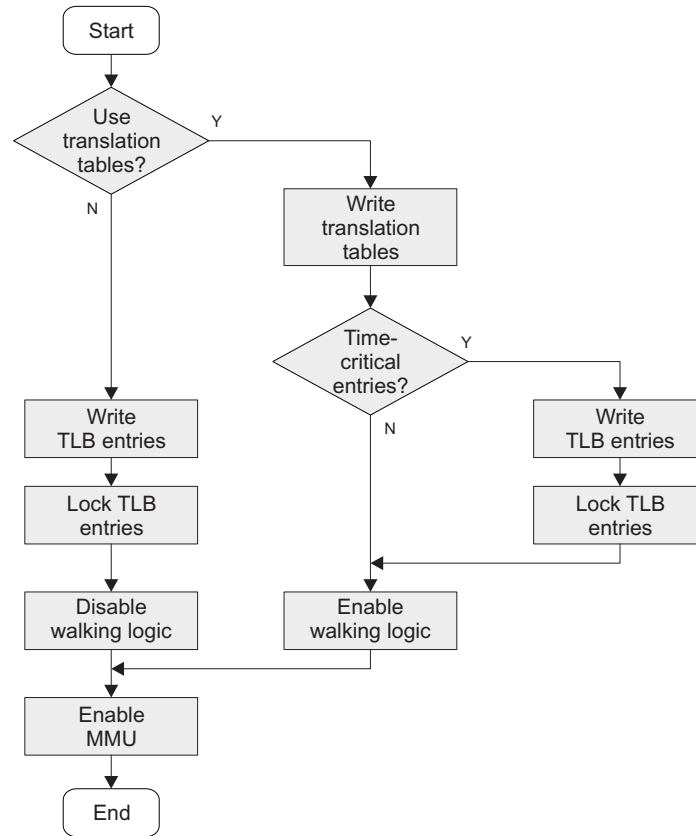

MMU instances can be used dynamically or statically, in other words, MMU can be managed by the MPU software or configured directly.

An MMU is configured dynamically when a software subroutine writes translation tables into the appropriate physical memory space. Translation tables are most likely stored in external SDRAM. They are automatically written by the MPU OS (symbian, Linux,...). Operating System may limit the memory section size to page or sections. A MPU memory management software treats all information concerning addressing. Sub-set tables can be copied into external SDRAM to automatically create a given MMU translation table. Features such as mixed region, endianness, element size are then overwritten in SDRAM to match one's need and customize Camera or IVA2.2 subsystems' need (8-bit exchange in little-endian format for example). Note that 16MB sections and 64KB page table entries must be duplicated 16 times with the same content in translation tables. This process avoids a second read operation when an access points to another element than first one in the table. If they are not copied the MMU will behave in an unpredictable way.

When an MMU is configured statically, translation tables are not used, and TLB entries are written directly by the programmer.

[Figure 8-18](#) shows the configuration strategies: static, dynamic and mixed use of MMU.

Figure 8-18. MMU Configuration Strategies

MMU-018

MMU components must be set up before the MMU can be used for address translation. The following steps are required:

- Initialize translation tables and the table walker logic if translation tables are used.
- Write TLB entries if required.
- Enable MMU.

Next paragraph explains how to configure the IVA2.2 MMU by directly writing the entries in the Translation Look-aside Buffer (TLB). The focus of this example is to explain the required configuration steps rather than to provide the most efficient implementation.

### 8.4.1 Writing TLB Entries Statically

This example deals with predefined translation strategy, that is, entries are “statically” written in the TLB.

This method avoids the need to write Translation tables in memory and is commonly used for relatively small address spaces. It ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten. To setup the MMU follow those steps:

1. Reset MMU: write MMU\_SYSCONFIG[1] SOFTRESET=1 and wait for the system reset completion by polling MMU\_SYSSTATUS[0] RESETDONE until it is equal to 1.
2. Set MMU\_SYSCONFIG[0] AUTOIDLE bit to enable power saving via automatic interface clock gating. After reset the Table walking logic remain disabled (MMU\_CNTL[2] TWLENABLE=0), the TLB is empty and the victim pointer points to the first TLB entry, Entry 0 (MMU\_LOCK[8:4] CURRENTVICTIM at 0). To initialize a TLB entry, follow those steps:
  3. Load the Virtual Address (VATAG), the preserved (P=1) and valid (V=1) bits and the page size (small or large page, section, supersection) into MMU\_CAM register.
  4. Load the Physical Address (PHYSICALADDRESS), the endianness (ENDIANNESS=0), element size

- (ELEMENTSIZE) and mixed page attributes bits (MIXED) into MMU\_RAM register.
5. Specify the TLB entry you want to write by setting the MMU\_LOCK[8:4] CURRENTVICTIM pointer. Start with TLB Entry 0 and increment this pointer for each subsequent entry you want to write.
  6. Load the specified entry in the TLB by setting MMU\_LD\_TLB[0] LDTLBITEM=1.
  7. Repeat steps 3 to 6 for all entries you want to write.  
Remember to increment the MMU\_LOCK[8:4] CURRENTVICTIM pointer with each entry you are writing. To prevent replacement of TLB entries see [Section 8.4.1.1](#), Protecting TLB Entries.  
To enable error handling when more than one valid entry exists in the TLB for the given virtual address or when no translation is found for the virtual address required (with the Table walking logic disabled):
  8. Enable Multi-hit fault and TLB miss with table walker disabled interrupts by writing 1 in MMU\_IRQENABLE[4] MULTIHITFAULT and MMU\_IRQENABLE[0] TLBMISS.
  9. To determine the cause of the fault interrupt the interrupt service routine (ISR) can read corresponding MMU\_IRQSTATUS bits. The virtual address that caused the fault can be determined by reading MMU\_FAULT\_AD.

---

**NOTE:** MMU errors result in a memory stall; the MMU will not process any request until the cause of the error has been addressed.

---

To enable memory translations enable MMU (virtual addresses are treated as physical addresses when MMU is disabled):

10. Set MMU\_CNTL[1] MMUENABLE=1 to enable memory translations enable the MMU (virtual addresses are treated as physical addresses when the MMU is disabled).

#### 8.4.1.1 Protecting TLB Entries

The first  $n$  TLB entries (with  $n <$  total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval via the table walking process.

The entry protection mechanism is shown in [Figure 8-16](#). To protect the first  $n$  TLB entries, set the MMU1.MMU\_LOCK[12:10] BASEVALUE field for the camera MMU (MMU2.MMU\_LOCK[14:10] BASEVALUE field for the IVA2.2 MMU) to  $n$ .

#### 8.4.1.2 Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, i.e., TLB entries that were written with the preserved bit set to zero, can be deleted by invoking a TLB flush. Such a TLB flush is invoked by setting the MMUn.MMU\_GFLUSH[0] GLOBALFLUSH bit.

Individual TLB entries can be flushed, regardless of the preserved bit setting, by specifying its virtual address in the MMUn.MMU\_CAM register and setting the MMUn.MMU\_FLUSH\_ENTRY[0] FLUSHENTRY bit.

The preserved bit should only be used on protected TLB entries, *as it does not prevent replacement by the table walking logic.*

#### 8.4.1.3 Reading TLB Entries

TLB entries can be read by you to determine the TLB content at runtime. In doing so, the TLB entry number is specified by setting the MMUn.MMU\_LOCK[8:4] CURRENTVICTIM pointer. CAM and RAM parts of the TLB entry can then be read in the MMUn.MMU\_READ\_CAM and MMUn.MMU\_READ\_RAM registers, respectively.

### 8.4.2 Programming the MMU Dynamically

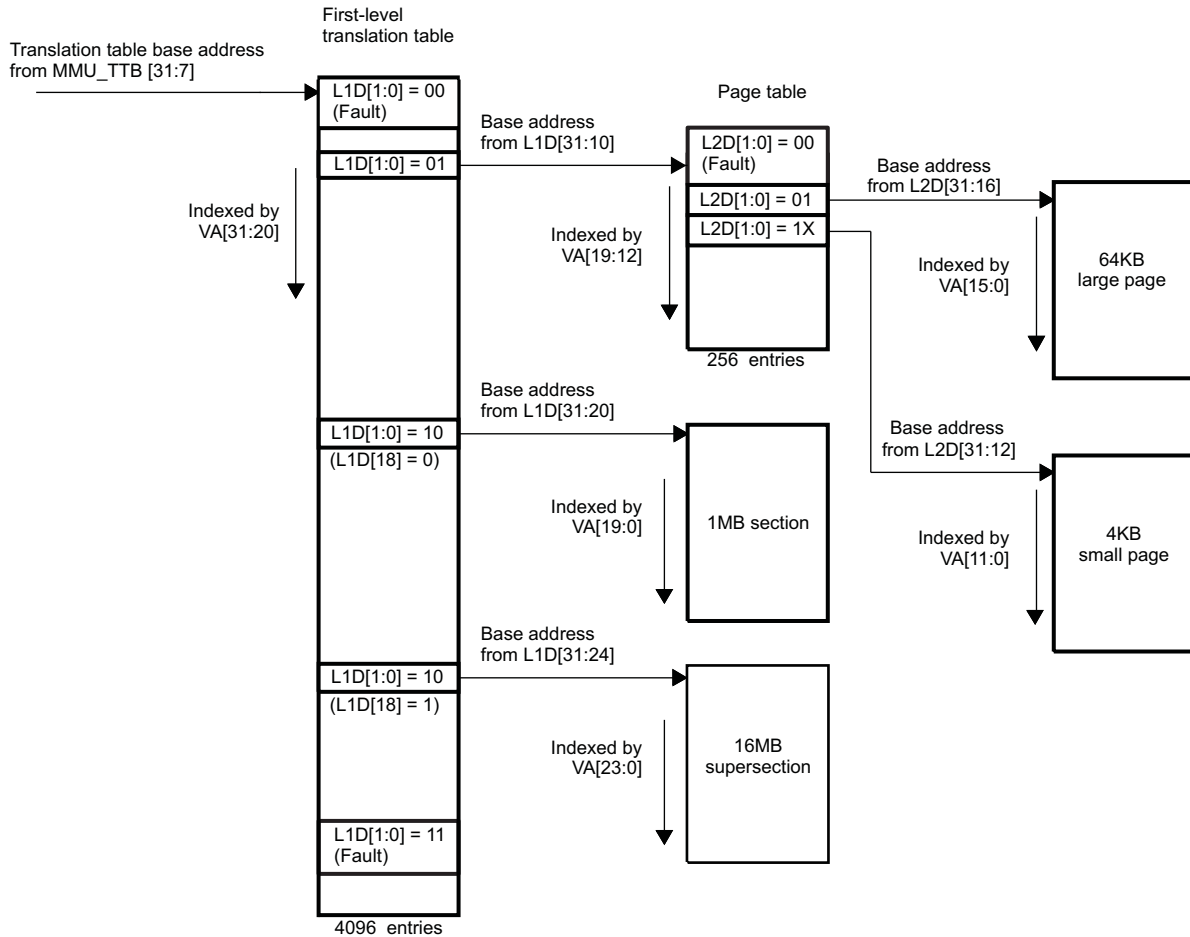

When translation tables are used for MMU address translation they must be properly set up and the table walking logic must be enabled.

The following page sizes are supported:

- Supersection: 16M bytes
- Section: 1M bytes
- Large page: 64K bytes
- Small page: 4K bytes

The memory location of these sections or pages (the Physical Address) is found by reading the Translation Table Hierarchy using a combination of the Virtual Address and the Translation Table Base address. Figure 8-19 illustrates the MMUn translation table hierarchy, with first-level descriptors (L1D) and second-level descriptors (L2D).

Figure 8-19. MMUn Translation Table Hierarchy

MMU-019

The first step is to build translation tables (first- and second-level translation tables depending on translation strategy) and place them into memory.

The start address of translation tables must always be aligned according to their size. For example, a 4096-entry first-level translation table must be aligned on a 16KB boundary (4096 Entries \* 4 bytes = 16KB), that is, the lower 14 bits of the translation table start address (MMUn.MMU\_TTB[13:0]) must be zero. For more details see Section 8.3.3.2.

After the translation tables have been written to memory the translation table base address, i.e. the most significant bits of the first-level translation table start address must be set. This is done using the MMUn.MMU\_TTB[31:7] TTBADDRESS field. See Section 8.5 for a complete description of the MMU control registers.

Once the translation tables have been written to memory and the translation table base is set, the table walking logic can be enabled. This is done by setting the MMUn.MMU\_CNTL[2] TWLENABLE bit.

### 8.4.2.1 Programming the MMU Using First- and Second-Level Translation Tables

Translation tables must be setup and written in memory. Each TLB entry contains a memory page size: 1MB section or 16MB supersection. When page size is smaller, 4KB or 64KB, second-level translation tables are necessary. To setup the MMU follow the same steps as in previous example but write the first- and second-level descriptors in physical memory.

The first-level translation table describes the translation properties for 1MB sections. 4096 32-bit entries (so-called first-level descriptors) are required to describe a 4GB address range with 1MB sections. The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table, that is, at least the last 14 address bits must be zero. The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address. Figure 8-20 through Figure 8-23 shows how the physical address is built from the virtual address as a function of the page sizes and hierarchy.

## 8.5 MMU Registers

The MMU1 (camera ISP MMU) and MMU2 (IVA2.2 MMU) instances are programmed using two identical sets of configuration registers. [Table 8-8](#) lists the base address of each register set.

**Table 8-8. MMU Instance Summary**

MMU Instance	Base Address	Size
MMU1 (Camera ISP MMU)	0x480B D400	256 bytes
MMU2 (IVA2.2 MMU)	0x5D00 0000	256 bytes

**NOTE:** The MPU MMU is configured using register CP15. For more information, please download the *ARM® Cortex™-A8 Technical Reference Manual* via the internet at <http://infocenter.arm.com>.

### 8.5.1 MMU Register Mapping Summary

Each MMU instance (except the MPU MMU) is programmed using a set of 18 configuration registers. [Table 8-9](#) lists these registers and their access type, access size, and offset against their respective base address.

**NOTE:** The registers and their bit fields in this set are identical for the two instances except the MMUn.MMU\_LOCK register, which has bit fields for the MMU1 (camera ISP MMU) that are different from the MMU2 (IVA2.2 MMU).

#### CAUTION

MMU2 instance (IVA2.2 MMU) registers are limited to 32-bit data accesses. Data access of 16-bit and 8-bit are not allowed and can corrupt register content.

**Table 8-9. MMU Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	MMU1 (Camera MMU) Physical Address	MMU2 (IVA2.2 MMU) Physical Address

## 8.5.2 MMU Register Descriptions

### 8.5.2.1 MMU\_SYSCONFIG

**Table 8-10. MMU\_SYSCONFIG**

<b>Address Offset</b>	0x010	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D410 0x5D00 0010		
<b>Description</b>	This register contains the various parameters of the interconnect interface.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																CLOCK ACTIVITY		Reserved			IDLEMODE		Reserved	SOFTRESET	AUTOIDLE						

Bits	Field Name	Description	Type	Reset
31:10	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x000000
9:8	CLOCKACTIVITY	Clock activity during wake-up mode Read 0x0: Functional and interconnect clocks can be switched off. Read 0x1, 0x2, 0x3: never happens. Write 0s for future compatibility.	R	0x0
7:5	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x0
4:3	IDLEMODE	Idle mode  0x0: Force idle. Idle request is acknowledged unconditionally. 0x1: No idle. Idle request is never acknowledged. 0x2: Smart idle. Acknowledgement to an idle request is given based on the internal activity of the module. 0x3: Reserved - Do not use	RW	0x0
2	Reserved	Reads return 0. Write 0s for future compatibility.	R	0
1	SOFTRESET	Software reset. This bit is automatically reset by the hardware. During reads, it always returns 0. Read 0x0: Always returns 0 Write 0x0: No functional effect Read 0x1: Never happens Write 0x1: The module is reset.	RW	0
0	AUTOIDLE	Internal interconnect clock gating strategy  0x0: Interconnect clock is free-running. 0x1: Automatic interconnect clock gating strategy is applied, based on the interconnect interface activity.	RW	0

**8.5.2.2 MMU\_SYSSTATUS**
**Table 8-11. MMU\_SYSSTATUS**

<b>Address Offset</b>	0x014		
<b>Physical address</b>	0x480B D414	<b>Instance</b>	MMU1 (Camera ISP MMU)
	0x5D00 0014		MMU2 (IVA2.2 MMU)
<b>Description</b>	This register provides status information about the module, excluding the interrupt status information.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																Reserved											RESETDONE				

Bits	Field Name	Description	Type	Reset
31:8	Reserved	Reads return 0.	R	0x000000
7:1	Reserved	Reads return 0. Reserved for interconnect-socket status information	R	0x00
0	RESETDONE	Internal reset monitoring 0x0: Internal module reset in ongoing. 0x1: Reset completed	R	-

### 8.5.2.3 MMU\_IRQSTATUS

**Table 8-12. MMU\_IRQSTATUS**

<b>Address Offset</b>	0x018		
<b>Physical address</b>	0x480B D418	<b>Instance</b>	MMU1 (Camera ISP MMU)
	0x5D00 0018		MMU2 (IVA2.2 MMU)
<b>Description</b>	This interrupt status register regroups all the status of the module internal events that can generate an interrupt.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																MULTIHITFAULT	TABLEWALKFAULT	EMUMISS	TRANSLATIONFAULT	TLBMISS											

Bits	Field Name	Description	Type	Reset
31:5	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x00000000
4	MULTIHITFAULT	Error due to multiple matches in the TLB Read 0x0: MultiHitFault false Write 0x0: MultiHitFault status bit unchanged Read 0x1: MultiHitFault is true (pending) Write 0x1: TableWalkFault status bit is reset	RW	0
3	TABLEWALKFAULT	Error response received during a table walk Read 0x0: TableWalkFault false Write 0x0: TableWalkFault status bit unchanged Read 0x1: TableWalkFault is true (pending) Write 0x1: TableWalkFault status bit is reset	RW	0
2	EMUMISS	Unrecoverable TLB miss during debug (hardware TWL disabled) Read 0x0: EMUMiss false Write 0x0: EMUMiss status bit unchanged Read 0x1: EMUMiss is true (pending) Write 0x1: EMUMiss status bit is reset	RW	0
1	TRANSLATION FAULT	Invalid descriptor in translation tables (translation fault) Read 0x0: TranslationFault false Write 0x0: TranslationFault status bit unchanged Read 0x1: TranslationFault is true (pending) Write 0x1: TranslationFault status bit is reset	RW	0
0	TLBMISS	Unrecoverable TLB miss (hardware TWL disabled) Read 0x0: TLBMiss false Write 0x0: TLBMiss status bit unchanged Read 0x1: TLBMiss is true (pending) Write 0x1: TLBMiss status bit is reset	RW	0

### 8.5.2.4 MMU\_IRQENABLE

**Table 8-13. MMU\_IRQENABLE**

<b>Address Offset</b>	0x01C	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D41C 0x5D00 001C		
<b>Description</b>	The interrupt enable register allows the module's internal sources of interrupt to be masked and unmasked on an event-by-event basis..		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reserved																												MULTIHITFAULT	TABLEWALKFAULT	EMUMISS	TRANSLATIONFAULT	TLBMISS

Bits	Field Name	Description	Type	Reset
31:5	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x0000000
4	MULTIHITFAULT	Error due to multiple matches in the TLB 0x0: MultiHitFault interrupt is masked 0x1: MultiHitFault event generates an interrupt if occurs	RW	0
3	TABLEWALKFAULT	Error response received during a table walk 0x0: TableWalkFault interrupt is masked 0x0: TableWalkFault event generates an interrupt if occurs	RW	0
2	EMUMISS	Unrecoverable TLB miss during debug (hardware TWL disabled) 0x0: EMUMiss interrupt is masked 0x1: EMUMiss event generates an interrupt if occurs	RW	0
1	TRANSLATIONFAULT	Invalid descriptor in translation tables (translation fault) 0x0: TranslationFault interrupt is masked 0x1: TranslationFault generates an interrupt if occurs	RW	0
0	TLBMISS	Unrecoverable TLB miss (hardware TWL disabled) 0x0: TLBMiss interrupt is masked 0x1: TLBMiss event generates an interrupt if occurs	RW	0

**8.5.2.5 MMU\_WALKING\_ST**
**Table 8-14. MMU\_WALKING\_ST**

<b>Address Offset</b>	0x040	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D440 0x5D00 0040		
<b>Description</b>	This register provides status information about the table walking logic.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																	TWLRUNNING														

Bits	Field Name	Description	Type	Reset
31:1	Reserved	Reads return 0.	R	0x00000000
0	TWLRUNNING	Table walking logic is running. 0x0: TWL completed 0x1: TWL running	R	0

### 8.5.2.6 MMU\_CNTL

**Table 8-15. MMU\_CNTL**

<b>Address Offset</b>	0x044	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D444 0x5D00 0044		
<b>Description</b>	This register programs the MMU features.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																EMUTLBUPDATE	TWLENABLE	MMUENABLE	Reserved												

Bits	Field Name	Description	Type	Reset
31:4	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x00000000
3	EMUTLBUPDATE	Enable TLB update on emulator table walk 0x0: Emulator TLB update disabled 0x1: Emulator TLB update enabled	RW	0
2	TWLENABLE	Table walking logic enable 0x0: TWL disabled 0x0: TWL enabled	RW	0
1	MMUENABLE	MMU enable 0x0: MMU disabled 0x1: MMU enabled	RW	0
0	Reserved	Reads return 0. Write 0s for future compatibility.	R	0

### 8.5.2.7 MMU\_FAULT\_AD

**Table 8-16. MMU\_FAULT\_AD**

<b>Address Offset</b>	0x048	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D448 0x5D00 0048		
<b>Description</b>	This register contains the virtual address that generated the interrupt.		
<b>Type</b>	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FAULTADDRESS																															

Bits	Field Name	Description	Type	Reset
31:0	FAULTADDRESS	Virtual address of the access that generated a fault	R	0x00000000

**8.5.2.8 MMU\_TTB**
**Table 8-17. MMU\_TTB**

<b>Address Offset</b>	0x04C	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D44C 0x5D00 004C		
<b>Description</b>	This register contains the resolution table base address.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TTBADDRESS																Reserved															

Bits	Field Name	Description	Type	Reset
31:7	TTBADDRESS	Translation table base address	RW	0x0000000
6:0	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x00

### 8.5.2.9 MMU\_LOCK

**Table 8-18. MMU\_LOCK**

<b>Address Offset</b>	0x050		
<b>Physical address</b>	0x480B D450	<b>Instance</b>	MMU1 (Camera ISP MMU)
	0x5D00 0050		MMU2 (IVA2.2 MMU)
<b>Description</b>	This register locks some of the TLB entries or specifies the TLB entry to be read.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														BASEVALUE			Reserved	CURRENTVICTIM			Reserved										

Bits	Field Name	Description	Type	Reset
31:15	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x00000
14:10	BASEVALUE	Locked entries base value Note: In the Camera MMU instance, BASEVALUE is a 3-bit field, ie. bits 13 and 14 are reserved.	RW	0x00
9	Reserved	Reads return 0. Write 0s for future compatibility.	R	0
8:4	CURRENTVICTIM	Current entry to be updated either by the TWL or by the software or TLB entry to be read. Note: In the Camera MMU instance, CURRENTVICTIM is a 3-bit field, ie. bits 7 and 8 are reserved. Write value: TLB entry to be updated by software or TLB entry to be read. Read value: TLB entry to be updated by table walk logic.	RW	0x00
3:0	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x0

**8.5.2.10 MMU\_LD\_TLB**
**Table 8-19. MMU\_LD\_TLB**

<b>Address Offset</b>	0x054	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D454 0x5D00 0054		
<b>Description</b>	This register loads a TLB entry (CAM+RAM).		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																LDTLBITEM															

Bits	Field Name	Description	Type	Reset
31:1	Reserved	Reads return 0. Write 0s for future compatibility	R	0x00000000
0	LDTLBITEM	Write (load) data in the TLB Read 0x0: Always returns 0 Write 0x0: No functional effect Read 0x1: Never happens Write 0x1: Load TLB data	RW	0

**8.5.2.11 MMU\_CAM**
**Table 8-20. MMU\_CAM**

<b>Address Offset</b>	0x058		
<b>Physical address</b>	0x480B D458	<b>Instance</b>	MMU1 (Camera ISP MMU)
	0x5D00 0058		MMU2 (IVA2.2 MMU)
<b>Description</b>	This register holds a CAM entry.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VATAG																Reserved								P	V	PAGESIZE					

Bits	Field Name	Description	Type	Reset
31:12	VATAG	Virtual address tag	RW	0x00000
11:4	Reserved	Reads return 0. Write 0s for future compatibility.	R	0x00
3	P	Preserved bit 0x0: TLB entry can be flushed 0x1: TLB entry is protected against flush	RW	0
2	V	Valid bit 0x0: TLB entry is invalid 0x1: TLB entry is valid	RW	0
1:0	PAGESIZE	Page size 0x0: Section (1MB) 0x1: Large page (64KB) 0x2: Small page (4KB) 0x3: Supersection (16MB)	RW	0x0

### 8.5.2.12 MMU\_RAM

**Table 8-21. MMU\_RAM**

<b>Address Offset</b>	0x05C	<b>Instance</b>	MMU1 (Camera ISP MMU) MMU2 (IVA2.2 MMU)
<b>Physical address</b>	0x480B D45C 0x5D00 005C		
<b>Description</b>	This register holds a RAM entry.		
<b>Type</b>	RW

## System Direct Memory Access (SDMA)

This chapter describes the system direct memory access (SDMA).

**NOTE:** This chapter gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. Ensure that DMA requests of unavailable modules and features are masked in DMA subsystems.

## 9.1 SDMA Module Overview

The System Direct Memory Access (SDMA), also called DMA4, performs high-performance data transfers between memories and peripheral devices without microprocessor unit (MPU) support during transfer. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The device also embeds dedicated DMA controllers: the video processing front end (VPFE) DMA; the display DMA; and the universal serial bus (USB) high-speed (HS) DMA. For more information, see *Video Processing Front End*, *Display Subsystem*, and *High-Speed USB Controllers* chapters.

The DMA controller includes the following main features:

- Data transfer support in either direction between:
  - Memory and memory
  - Memory and peripheral device
- 32 logical DMA channels supporting:
  - Multiple concurrent transfers
  - Independent transfer profile for each channel
  - 8-bit, 16-bit, or 32-bit data element transfer size
  - Software-triggered or hardware-synchronized transfers
  - Flexible source and destination address generation
  - Burst read and write
  - Chained multiple-channel transfers
  - Endianism conversion
  - Per-channel secure transaction attribute (not available on GP device)
- First-come, first-serve DMA scheduling with fixed priority
- Up to 96 DMA requests
- Constant fill
- Transparent copy
- Four programmable interrupt request output lines
- Software or hardware enabling
- FIFO depth: 256 x 32-bits
- Data buffering
- FIFO budget allocation
- Power-management support
- Auto-idle power-saving support
- Implementation of retention flip-flops (RFFs) to support dynamic power saving (DPS) between system power modes without MPU involvement
- Initiators for secure transactions on the L3 and L4 interconnect (not available on GP device)

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

Figure 9-1 shows an overview of the SDMA module.

Figure 9-1. SDMA Overview

DMA-001

The SDMA module has two ports—one read and one write—and provides multiple logical channel support. A dynamically allocated FIFO queue memory pool provides buffering between the read and write ports.

The MPU configures the SDMA through the L4 interconnect.

## 9.2 SDMA Controller Environment

### 9.2.1 Environment Overview

The read and write ports of the SDMA controller are connected to the device through the L3 interconnect. The control port is connected to the L4 interconnect. The SDMA interrupt lines are connected to the interrupt lines of the MPU interrupt controller. The SDMA can handle up to 96 DMA requests, including four external hardware DMA requests.

### 9.2.2 SDMA Request Scheme

The hardware DMA request line schemes can be either edge-sensitive or transition-sensitive.

The sensitivity selection of the DMA request line can be configured in the system control module with the following register bits:

- CONTROL.CONTROL\_DEVCONF0[0] SENSDMAREQ0 register bit for sys\_ndmareq0
- CONTROL.CONTROL\_DEVCONF0[1] SENSDMAREQ1 register bit for sys\_ndmareq1
- CONTROL.CONTROL\_DEVCONF1[7] SENSDMAREQ2 register bit for sys\_ndmareq2
- CONTROL.CONTROL\_DEVCONF1[8] SENSDMAREQ3 register bit for sys\_ndmareq3

The default scheme is transition sensitive. All internal peripherals of the device use the transition-sensitive scheme.

Figure 9-2 shows the DMA request captured on a falling edge in the edge-sensitive scheme.

**Figure 9-2. Edge-Sensitive DMA Request Scheme**

108-013

For a transition-sensitive DMA request (see Figure 9-3), the line must be maintained low (asserted) until the first DMA access is complete, after which the line must be maintained high (de-asserted) for a minimum of one clock cycle (CORE\_L3\_ICLK):

When the de-assertion time is less than one clock cycle, the SDMA might not detect the de-assertion.

When the channel is enabled one cycle after a DMA request is disabled, the channel detects the DMA request and starts the corresponding transfer.

When the channel is enabled two cycles after the DMA request is disabled, the channel does not detect the DMA request.

**Figure 9-3. Transition-Sensitive DMA Request Scheme**

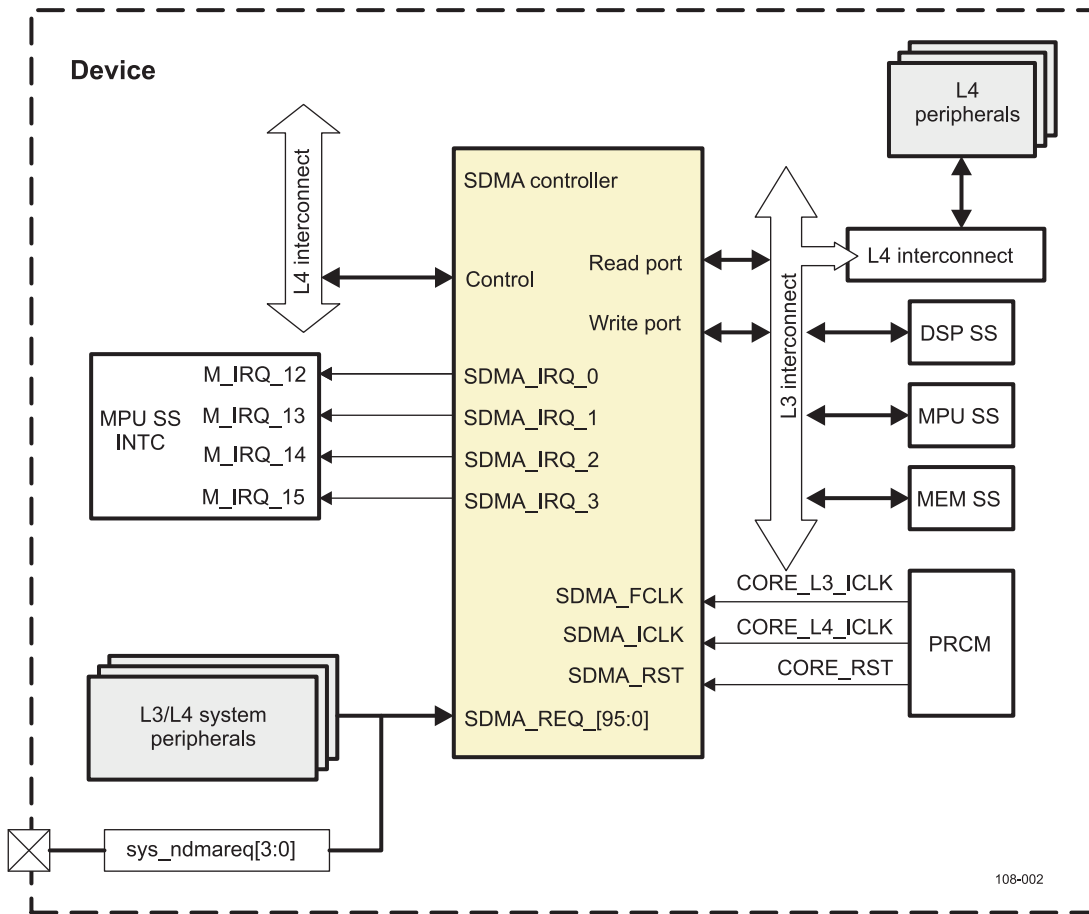

108-012

### 9.3 SDMA Module Integration

Figure 9-4 highlights the SDMA controller integration.

Figure 9-4. SDMA Controller Integration

#### 9.3.1 External SDMA Request Interface Description

The sys\_ndmareq pins are optional external DMA requests used by external devices to establish direct hardware synchronization with the SDMA controller. A logical channel can be configured to respond to an external synchronization request. These requests can be configured to either active low on level or falling edge active by the control module.

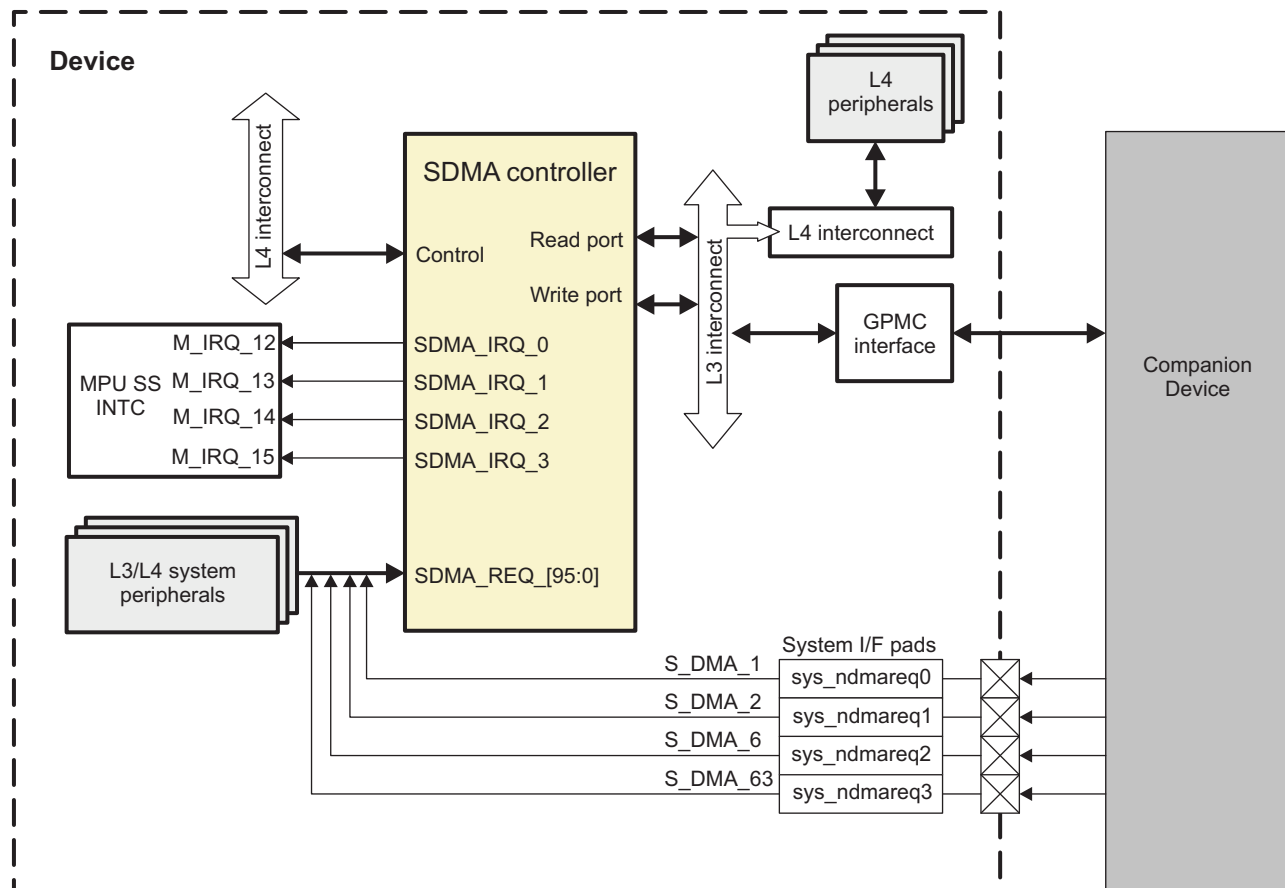

Table 9-1 shows the I/O description of the external DMA request pin.

Table 9-1. Description External DMA Request Pin

Signal Name	IO	Description	Reset
sys_ndmareq0	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq1	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq2	I	External DMA request to the SDMA controller	Unknown
sys_ndmareq3	I	External DMA request to the SDMA controller	Unknown

Figure 9-5 shows the SDMA environment with an example of how to use the external hardware DMA request pins.

**Figure 9-5. Example of External DMA Requests to the SDMA Controller**

108-003

For example, an external device can use the external DMA request pins to start a logical channel transfer over the general-purpose memory controller (GPMC) interface. The transfer can be a memory-to-memory transfer in which the source memory is in the external device.

The external DMA request signals are not available on external pins by default after cold reset. See the *System Control Module* chapter for instructions on multiplexing out the seven signal lines to pins.

### 9.3.2 Clocking, Reset, and Power-Management Scheme

#### 9.3.2.1 Clocking

The SDMA controller uses two clock domains:

- CORE\_L4\_ICLK supports the configuration port.
- CORE\_L3\_ICLK is both a functional clock for all internal logic and for the two master read and write ports.

The SDMA controller supports a software-controlled standby mode with an input clock shutoff. Setting the `PRCM.CM_IDLEST1_CORE[2] ST_DMA` status bit to 1 allows detection of the SDMA power mode.

For more information about power management and clock idle, see [Section 9.4.20, Power Management](#).

### 9.3.2.2 Resets

#### 9.3.2.2.1 Asynchronous Hardware Reset

The SDMA controller is part of the CORE\_RST reset domain.

#### 9.3.2.2.2 Software Reset through the Configuration Port

The SDMA controller can be reset independently by software through the SDMA.DMA4\_OCP\_SYSCONFIG[1] SOFTRESET bit. Setting the bit to 1 enables an active software reset that is functionally equivalent to a hardware reset.

Hardware and software resets initialize all of the logic in the SDMA module and the global registers and some of the per-channel registers (such as the enable bit hardware request line number and link bit field) implemented in flip-flops. However, all remaining per-channel registers are memory-based and, therefore, are not reset.

### 9.3.3 Hardware Requests

#### 9.3.3.1 Interrupts to the MPU Subsystem

DMA4 has four interrupt lines, numbered  $L_j$  with  $j=0..3$ . Each logical channel can request an interrupt over any line. The attachment of a channel interrupt event to one of these four external lines is programmable. The software determines whether it attaches a channel interrupt to a single IRQ line or to multiple IRQ lines.

There are two different registers per interrupt line:

- SDMA.DMA4\_IRQSTATUS\_Lj CH\_31\_0\_Lj field shows the status of the different sources of interrupt. If the SDMA.DMA4\_IRQENABLE\_Lj bit  $i$  is 1, the channel  $i$  is the source of interrupt in line  $j$ . In contrast to the SDMA.DMA4\_CSRi registers, the SDMA.DMA4\_IRQSTATUS\_Lj registers are updated regardless of the corresponding bits in the SDMA.DMA4\_IRQENABLE\_Lj registers.
- SDMA.DMA4\_IRQENABLE\_Lj CH\_31\_0\_Lj\_EN field masks/unmasks the channel interrupt. If the SDMA.DMA4\_IRQENABLE\_Lj bit  $i$  is set to 0, the channel interrupt  $i$  of the line  $j$  is masked.

Each logical channel can generate 10 different interrupt events when enabled (that is, set to 1) in the SDMA.DMA4\_CICRi register. Each status bit is updated in the SDMA.DMA4\_CSRi register only when the corresponding enable bit is enabled in the SDMA.DMA4\_CICRi register.

To determine an interrupt source when an interrupt rises on an interrupt line  $L_j$ , you must:

- Identify the channel (LCH $i$ ) generating the interrupt.  
Read the SDMA.DMA4\_IRQSTATUS\_Lj.LCH $i$  (LCH0 to LCH31). If LCH $i$  = 1, channel  $i$  is the originator of the interrupt.
- Identify the interrupt event.  
Read the LCH $i$  SDMA.DMA4\_CSRi. For example, if the drop event (the SDMA.DMA4\_CSRi[1] DROP bit) is 1, there will be a request collision.  
The interrupt event status bit in the SDMA.DMA4\_CSRi register is immediately reset after it is written to 1.  
The interrupt status bit in the SDMA.DMA4\_IRQSTATUS\_Lj register is cleared after it is written to 1.

Table 9-2 shows how the SDMA module interrupt lines are connected to the interrupt lines of the MPU interrupt controller.

**Table 9-2. SDMA Interrupt Mapping to the MPU Subsystem**

### 9.3.3.2 DMA Requests to the SDMA Controller

This section gives information about all modules and features in the high-tier device. See Chapter 1, the *Device Family* section, to check availability of modules and features. Ensure that DMA requests of unavailable modules and features are masked in DMA subsystems.

All peripherals internal to the device use the transition-sensitive scheme for DMA requests. For more information on the transition-sensitive scheme, see [Section 9.2.2, SDMA Request Scheme](#). [Table 9-3](#) lists the SDMA request mapping.

### 9.4 SDMA Functional Description

The SDMA module provides high-performance data transfers between memories and peripheral devices with low processor use. A DMA transfer is programmed through a logical DMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

Figure 9-6 shows the SDMA controller top-level block diagram.

Figure 9-6. SDMA Controller Top-Level Block Diagram

108-005

### 9.4.1 Logical Channel Transfer Overview

As Figure 9-6 shows, the SDMA module has one read port and one write port operating independently of each other. Buffering is provided between the read and write ports through a FIFO queue memory pool that is shared dynamically between the active logical channels.

- Logical channel synchronization

A logical channel is described as hardware-synchronized when the DMA transfers are triggered by DMA requests from a hardware device. Alternatively, a logical channel is described as nonsynchronized when the DMA transfer is triggered by software.

- Logical channel activation

A logical channel becomes active as follows:

- For hardware-synchronized transfers, when the logical channel is enabled and the hardware DMA request line is asserted
- For software-triggered (nonsynchronized) transfers, as soon as software enables the logical channel

- Logical channel transfer composition

A DMA transfer is divided automatically into a number of transactions. Depending on the logical channel context configured, transfer size, the start address alignment, the addressing mode, and the configured maximum burst size, each transaction can be either a single access or a burst of accesses.

- Logical channel scheduling

When several logical channels are active at the same time, schedulers manage the read and write ports. The scheduling of logical channel transfers is similar for both read and write ports. When a logical channel becomes active, it is added to the tail of a scheduling queue. If more than one logical channel becomes active at the same time, the one with the lower number is queued first. This mechanism provides a first-come, first-serve scheduling scheme between the concurrently active logical channels.

In addition, each read and write port has a high-priority queue and a low-priority queue. The priority bit in the logical channel SDMA.DMA4\_CCRi register determines if a logical channel is queued as high or low priority. The relative weighting of the scheduling of the high-priority queue to the low priority queue is programmable from 1:1 to 1:256 through the DMA global channel register (SDMA.DMA4\_GCR).

---

**NOTE:** The SDMA.DMA4\_GCR[23:16] ARBITRATION\_RATE field is not dependent on the SDMA.DMA4\_GCR[13:12] HI\_THREAD\_RESERVED field. The ARBITRATION\_RATE field is dependent on the SDMA.DMA4\_CCRi[26] WRITE\_PRIORITY bit and the SDMA.DMA4\_CCRi[6] READ\_PRIORITY bit.

---

- Read/write port access scheduling policy

When either the read or write port becomes available, the port access scheduler selects the next logical channel for which to perform a DMA transaction from either the high- or low-priority queue.

When the current DMA transaction (single or burst access) is complete and the full DMA transfer is not finished, the logical channel returns to the tail of the queue. Because the port access scheduling is on a per-transaction basis, a logical channel can be queued repeatedly this way several times during a single transfer.

The SDMA module can have up to four outstanding read transactions and two outstanding write transactions in the system interconnect; four read and two write thread IDs exist. For an arbitration cycle to occur, these two conditions must be met:

- At least one channel is requesting.
- At least one free thread ID is available.

On an arbitration cycle, the scheduler grants the highest priority channel that has an active request, allocates the thread ID, and tags this thread as busy. At a given time, a channel cannot be allocated for more than one thread ID.

---

**NOTE:** If more than one channel is active, each channel is given a thread ID for the current service only, not for the whole channel transfer.

---

When only one channel is active, one thread ID is allocated during the channel transfer. The access can be up to a 16 x 32-bit access (that is, 16 32-bit single access, four bursts of 16bytes, two bursts of 32bytes, or one burst of 64bytes) without rescheduling the channel at the end of each burst transfer.

When nonburst alignment is at the beginning of the transfer, the channel is rescheduled for each smaller access until burst-aligned. When the end of the transfer is not burst-aligned, the channel is rescheduled for each of the remaining smaller accesses.

For a logical channel transfer completion, when the last access is written to the destination, the logical channel becomes inactive. If enabled, an interrupt request is generated (see [Section 9.4.12, Interrupt Generation](#)).

### 9.4.2 FIFO Queue Memory Pool

A FIFO queue memory pool provides buffering between the read and write ports. The hardware allocates the space dynamically to a number of FIFO queues, and each queue is associated with an active logical channel.

To avoid a memory pool overflow, if there are fewer entries in the FIFO queue memory pool than are required for the maximum configured source burst size of the next logical channel to be scheduled, the logical channel is returned to the tail of the queue, and the port access scheduler continues to search the queue until it finds a logical channel that can be scheduled.

The maximum FIFO depth that can be allocated to each individual logical channel can be limited globally through the SDMA.DMA4\_GCR register. This value should be configured to allow a fair allocation of the memory pool between the active channels.

A logical channel is scheduled if it has not yet reached its allocation limit, even if the access to be performed will exceed this limit. This means that the effective number of entries used by a particular logical channel is limited to the configured maximum entries per channel + channel maximum configured burst size (in words) - 1.

### 9.4.3 Addressing Modes

A DMA transfer block consists of a number of frames (FN). Each frame consists of a number of elements, and each element can have a size of 8, 16, or 32 bits, as follows:

$$\text{transfer block size} = \text{number of frames} \times \text{number of elements per frame} \times \text{element size}$$

The FN, number of elements per frame (EN), and size of elements are common for both the source and destination. However, the way in which the data is represented (addressing profile/mode) is independently programmable for the source and destination devices, using one of these four addressing modes:

- Constant: The address remains the same for consecutive element accesses.
- Post-increment: The address increases by the element size (ES), even across consecutive frames.
- Single-index: The address increases by the ES, plus the element index (EI) value minus one (even across consecutive frames).
- Double-index: The address increases by the ES, plus the EI value minus one within a frame. When a full frame is transferred, the address increases by the ES plus the frame index (FI) value minus 1.

The ES, EI, and FI values are expressed in bytes. The EI and FI values can be positive or negative.

When calculating the EI and FI values, it is critical to note that, after an element is accessed, the logical channel address pointer equals the address of the last byte (highest address) of the accessed element. The correct value for the EI or FI should be such that, when added to the logical channel address pointer, results in the address of the first byte (lowest address) of the next element to be accessed.

The EI and FI values must be configured so that the address of each element in the transfer is aligned on an ES boundary.

Consequently, the single-index addressing mode with EI = 1 or double-index addressing mode with EI = 1 and FI = 1 is equivalent to post-increment addressing.

---

**NOTE:** The source and destination start addresses must also be aligned on an ES boundary.

---

When the address of an element to be accessed is not aligned on an ES boundary, the transfer is stopped and an address error interrupt occurs, if enabled (see [Section 9.4.12, Interrupt Generation](#)).

The SDMA.DMA4\_CFNi register configures the FN in a block.

The SDMA.DMA4\_CENi register configures the EN.

The SDMA.DMA4\_CSDPi register configures the ES.

The SDMA.DMA4\_CSSAi and SDMA.DMA4\_CDSAi registers configure the source and destination start addresses.

The SDMA.DMA4\_CCRi register configures the source and destination addressing modes.

The SDMA.DMA4\_CSEli, SDMA.DMA4\_CSFli, SDMA.DMA4\_CDEli, and SDMA.DMA4\_CDFli registers configure the source EI, source FI, destination EI, and destination FI, respectively.

The addressing profiles are expressed as equations as follows:

Equation 1. Constant addressing:

$$A(n+1) = A(n)$$

Equation 2. Post-increment addressing:

$$A(n+1) = A(n) + ES$$

Equation 3. Single-indexed addressing:

$$A(n+1) = A(n) + ES + (EI - 1)$$

Equation 4. Double-indexed addressing:

When not at the end of a frame or transfer (that is, when the element counter  $\neq 0$ ):

$$A(n+1) = A(n) + ES + (EI - 1)$$

When at the end of a frame but not at the end of the transfer (that is, when the element counter = 0 and the frame counter  $\neq 0$ ):

$$A(n+1) = A(n) + ES + (FI - 1)$$

Calculate the element and frame index as follows:

Equation 5. Element index

$$EI = [(Stride EI - 1) * ES] + 1$$

Equation 6. Frame index

$$FI = [(Stride FI - 1) * ES] + 1$$

where:

A(n): Byte address of the element n within the transfer.

ES is in bytes,  $ES \in \{1, 2, 4\}$ .

EI is in bytes, specified in a configuration register,  $-32768 \leq EI \leq 32767$ .

Stride EI: The difference in the number of elements between the start of the current element, n, to the start of next element, n+1.

Element counter: A counter that is (re)initiated with the number of elements per frame or per transfer. Decreased by 1 for each element transferred. The initial value is configured in the register DMA channel element number, SDMA.DMA4\_CENi.

F is in bytes, specified in a configuration register,  $-2147483648 \leq FI \leq 2147483647$ .

Stride FI: The difference in the number of elements between the start of the last element of the current frame and the beginning of the first element of the next frame.

Frame counter: A counter that is (re)initiated with the FN per transfer. Decreased by 1 for each frame transferred. The initial value is configured in the register DMA channel frame number, SDMA.DMA4\_CFNi.

Figure 9-7 shows how a stride EI and FI are defined. When handling complex configurations, using strides can make it easier to calculate EI and FI because you can calculate in elements instead of bytes. (This approach is used in the 90Degrees clockwise image rotation example shown in Figure 9-11.) The double-index addressing example shown in Figure 9-7 has  $ES = 4$ ,  $EN = 2$ ,  $EI = 5$ ,  $FI = 5$ , and  $FN = 2$ .

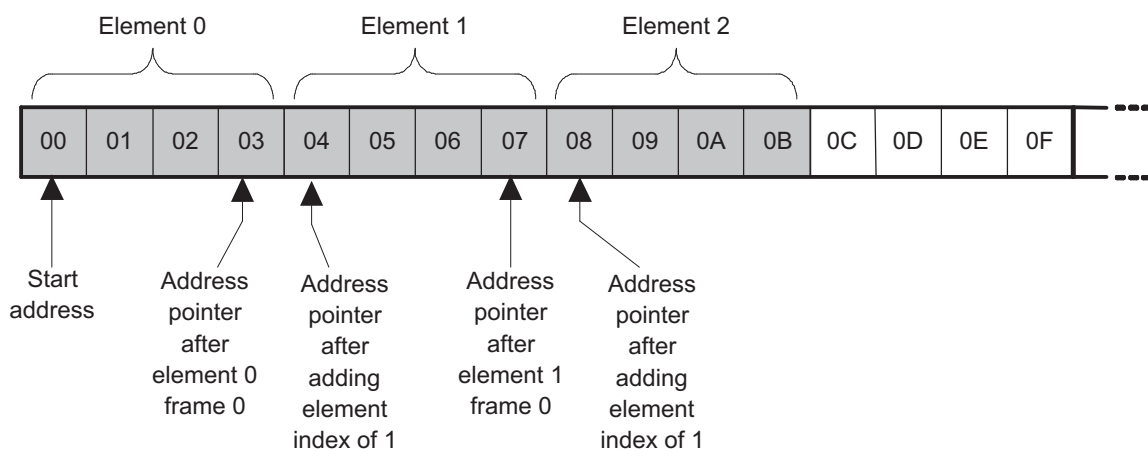

Figure 9-7 through Figure 9-10 show examples of addressing mode configurations. Table 9-4 lists parameter values for the examples.

**Figure 9-7. Example Showing Double-Index Addressing, Elements, Frames, and Strides**

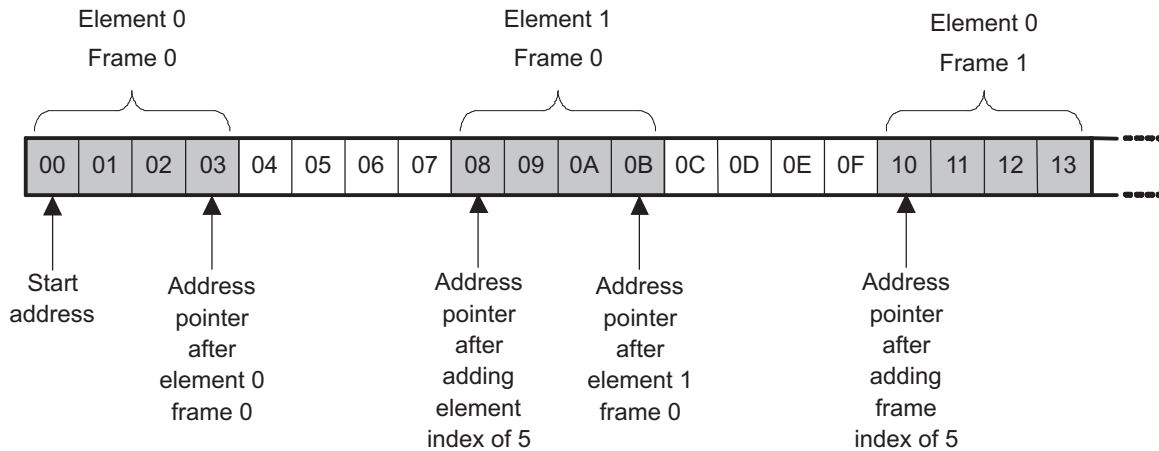

108-011

**Figure 9-8. Addressing Mode Example (a)**

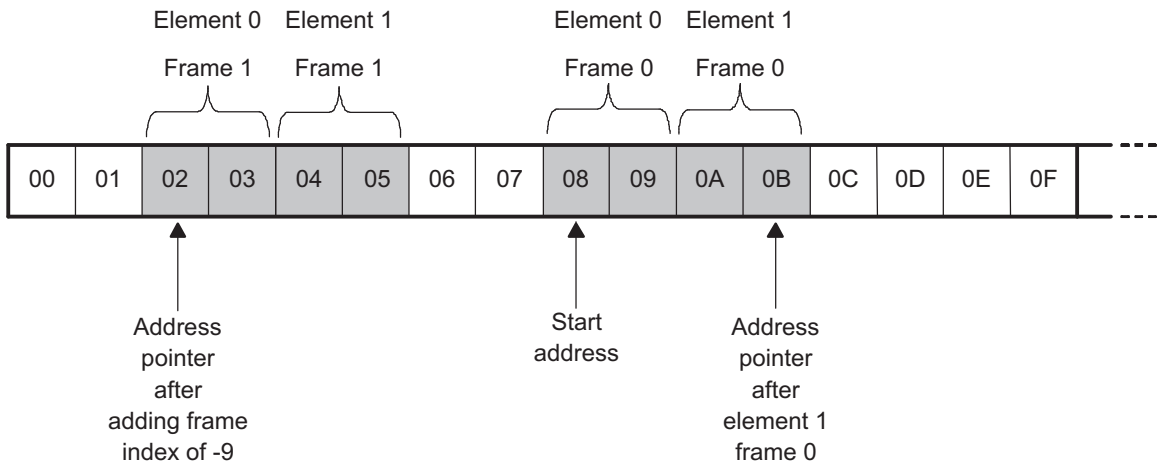

108-010

Figure 9-9. Addressing Mode Example (b)

108-009

Figure 9-10. Addressing Mode Example (c)

108-008

Table 9-4. Parameter Values for Addressing Mode Examples (a), (b), and (c)

Parameter	Example (a)	Example (b)	Example (c)
Addressing mode	Single index (or post-increment)	Double index	Double index
Start address	0	0	8
ES	4 (32-bit)	4 (32-bit)	2 (16-bit)
EN	3	2	2
EI	1	5	1
FN	1	2	2
Frame index	N/A	5	-9

Double indexing can occur either on source (read) or destination (write). Equations for rotation of  $xx$  degrees on destination are obtained by taking equations for rotation of  $(360-xx)$  degrees on source, and swapping  $x$  and  $y$  in them. The opposite is also true. Table 9-5 list the equations for rotation for  $90$ ,  $180$  and  $270^\circ$ .

**Table 9-5. Equations for Rotation**

		90° Rotation	180° Rotation	270° Rotation
Double indexing on destination (write)	Base address	$ES*(y-1)$	$ES*(x*y-1)$	$ES*y*(x-1)$
	Element index (EI)	$ES*(y-1)+1$	$1-2*ES$	$1-ES*(y+1)$
	Frame index (FI)	$1 - ES*[(x-1)*y+2]$	$1-2*ES$	$1+ES*(x-1)*y$
Double indexing on source (read)	Base address	$ES*x*(y-1)$	$ES*(x*y-1)$	$ES*(x-1)$
	Element index (EI)	$1-ES*(x+1)$	$1-2*ES$	$ES*(x-1)+1$
	Frame index (FI)	$1+ES*(y-1)*x$	$1-2*ES$	$1 - ES*[(y-1)*x+2]$

Table 9-6 and Figure 9-11 show the configuration required to perform a 90° clockwise image rotation of a 240 x 160 pixel, 32-bit image. The EI, frame size, and FI values are configured so that the image is rotated line by line starting at the left-hand end of the top line.

**NOTE:** The FI value for the destination is negative so that the first pixel of each subsequent line of the source image is written to the correct location at the destination.

Equation 5 and Equation 6 calculate the destination FI and EI. The example assumes that the image lines are stored at consecutive addresses in memory, meaning that both EI and FI on the source side are 1.

### Rotations:

Section 9.5.7, 90° Clockwise Image Rotation, describes how to program this example.

Observe that:

- One pixel = one element
- One line = one DMA frame
- Pixel size = element size = ES

**Table 9-6. Example Parameter Values for a 90° Clockwise Image Rotation**

Parameter	Source Value	Destination Value
Bits per pixel	32	32
ES	4	4
Image width	SW	SH
Image height	SH	SW
Stride elements (stride EI)	1 element	SH
Stride frames (stride FI)	1 element	$-[(SW-1)*SH+1] = -38241$ elements
Start address	0x100000	$0x200000 + (SH - 1) \times ES = 0x20027C$
EN	SW	SW
EI	$[(Stride EI - 1) * ES] + 1 = 1$	$[(Stride EI - 1) * ES] + 1 = 637$
FN	SH	SH
FI	$[(Stride FI - 1) * ES] + 1 = 1$	$[(Stride FI - 1) * ES] + 1 = -152967$

Figure 9-11. Example of a 90° Clockwise Image Rotation

108-007

#### 9.4.4 Packed Accesses

When the logical channel ES is less than the DMA module read/write port size, and the addressing profile supports it (that is, post-increment mode or single- or double-index mode with EI = 1), the number of elements to transfer in each read/write port access may be maximized by specifying that the source or destination is packed through the channel SDMA.DMA4\_CSDPi register. Thus:

- For a read/write port size of 32 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (four elements per access) and 16 bits (two elements per access).
- For a read/write port size of 64 bits, the source or destination can be configured as packed for transfer ESs of 8 bits (eight elements per access), 16 bits (four elements per access), and 32 bits (two elements per access).

Depending on the start address and transfer length, the first or last packed access might be only partially filled. This is indicated to the source or destination using the byte-enable signals.

---

**NOTE:** When a constant addressing mode is specified, only nonpacked accesses are used, and specifying the accesses as packed has no effect.

---

#### 9.4.5 Burst Transactions

Transfer performance can be improved, where the source or destination and addressing profile supports it, by configuring the logical channel to perform burst transactions consisting of multiple instead of single accesses. The channel can be programmed to use burst sizes equivalent to 16, 32, or 64 bytes through the SDMA.DMA4\_CSDPi register, with the read burst size being programmable independently of the write burst size. Typically, the optimal burst size is 64 bytes (16 accesses for a 32-bit read/write port size or 8 accesses for a 64-bit read/write port size).

To obtain the maximum benefit from burst transactions, the source and destination start addresses should be aligned with the burst size. If this is not the case, the start of the transfer can consist of a number of smaller (single or burst) transactions until the first burst size boundary is reached.

Similarly, if the end of the transfer is not aligned on a burst size boundary, the final part of the transfer can consist of a number of smaller transactions.

---

**NOTE:** Except in the constant addressing mode, the source or destination must be specified as packed for burst transactions to occur.

---

### 9.4.6 Endianism Conversion

The source and destination are each specified as little-endian or big-endian through the SDMA.DMA4\_CSDPi register for the particular logical channel. If the endianism of the source and destination differ, and the logical channel ES is less than the SDMA module read/write port size, an endianism conversion is applied to the data before it is written to the destination.

When transferring data between a source and a destination with different endianism, it is important to specify an ES that is equal to the type of data being transferred to preserve the correct data image at the destination.

In the system, endianism conversion can be performed in more than one place. It is possible to inform the source and/or destination to lock the endianism (that is, to not perform a conversion) through the logical DMA channel SDMA.DMA4\_CSDPi register.

### 9.4.7 Transfer Synchronization

A logical channel can be programmed for either software-triggered or hardware synchronized transfers.

#### 9.4.7.1 Software Synchronization

A transfer is software-triggered when the logical channel is set up and started by software. To specify a software-triggered transfer, set the channel DMA register bits SDMA.DMA4\_CCRi[4:0] and SDMA.DMA4\_CCRi[20:19] to 0. The transfer starts as soon as the DMA register bit SDMA.DMA4\_CCRi[7] is set (that is, enters the scheduling process).

#### 9.4.7.2 Hardware Synchronization

A transfer is hardware-synchronized if the logical channel activation is driven by hardware requests from either the source or destination target. A hardware synchronized transfer is specified by configuring the DMA request line number in the channel SDMA.DMA4\_CCRi register to a value that corresponds to the DMA request line from the source or destination that generates the DMA requests. The DMA request numbers to be configured are specified in the DMA request mapping (see [Table 9-8](#)).

Specify the DMA request number in the channel DMA register bits SDMA.DMA4\_CCRi[4:0] and SDMA.DMA4\_CCRi[20:19]. After the DMA register bit SDMA.DMA4\_CCRi[7] is set, the logical channel becomes enabled but not activated (that is, it does not enter the scheduling process), which means that channel registers are not updated until the first DMA request is received.

---

**NOTE: DMA Request Line**

A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

The channel synchronization control registers are 1-based. For example, to enable the S\_DMA\_1 request, SDMA.DMA4\_CCRi[4:0] SYNCHRO\_CONTROL must be set to 0x2 (DMA request number + 1).

---

For hardware synchronization, the amount of data to be transferred for each assertion of the DMA request line is configured through the frame synchronization (FS) and block synchronization (BS) bits in the logical channel SDMA.DMA4\_CCRi register and the DMA register bits SDMA.DMA4\_CCRi[5] and SDMA.DMA4\_CCRi[18], respectively.

The amount of data can be any of the following:

- A single element transfer: A complete element defined by Data\_type. For example, 8/16/32 bits are transferred in response to a DMA request.
- A full frame: A complete frame of several elements is transferred in response to a DMA request.

- A full block (a full channel transfer): A complete block of several frames is transferred in response to a DMA request.
- A full packet (a full channel transfer): A complete packet of several elements is transferred in response to a DMA request.

Packets allow the size of each part of the full DMA transfer to be configured independent of the organization of the data to be transferred (typically a number of elements). This can be useful when the source or destination has a buffer (such as a FIFO queue) with a size unrelated to the frame size of the transfer. The packet size then can be set to the size of the buffer.

Packet transfer must be used only where the source or destination is addressed in constant addressing mode, because FI registers are reused to specify size of the packet.

To support the burst mode, the logical channel must also be configured to use the source-port packed access mode. The packed address mode cannot be used with a constant address mode: it must be configured to use a post-increment address mode.

The packet size is configured based on the source/destination synchronization select bit in the SDMA.DMA4\_CCRi register through either the channel SDMA.DMA4\_CDFli register (source synchronized) or the SDMA.DMA4\_CSFli register (destination synchronized).

When the logical channel transfer block is not an exact multiple of the packet size, the final packet consists of the remaining elements in the transfer, using burst or single accesses to complete the block transfer.

The maximum transfer size, regardless of the packet size, is always as follows:

$$\text{Block\_size} = \text{Number\_of\_Frame\_in\_Block} * \text{Number\_of\_Element\_in\_Frame} * \text{Element\_Size}$$

- Synchronized at the source

The DMA module optimizes the transfer with respect to the number and size of burst transactions for the given source and destination addressing profiles and configured maximum burst sizes. When writing to the destination is slower than reading from the source, data is buffered in the channel FIFO queue. If the transfer is packet-synchronized at the source, the end-of-packet interrupt is disabled (see [Section 9.4.11, Reprogramming an Active Channel](#)).

For a source synchronized transfer, buffering can be enabled or disabled by setting the SDMA.DMA4\_CCRi[25] BUFFERING\_DISABLE bit. For a packet source synchronization with buffering disabled and the packed/burst across the packet boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the packet transfer size. However, for a packet source synchronized transfer with buffering enabled and with the packed/burst across the packet boundary, the DMA module waits for the next DMA request(s) to read enough data to issue an atomic packed/burst write transaction (assuming the address is packed/burst aligned).

---

**NOTE:** Regardless whether buffering is enabled or not, buffering is not performed between frames. If the packed/burst is across the frame boundary, the last packed/burst write transaction is split in optimized smaller accesses to complete the frame transfer size.

---

- Synchronized at the destination

The performance of a hardware-synchronized transfer can be improved by using the prefetch mode, enabled through the channel DMA register bit SDMA.DMA4\_CCRi[23]. Data is prefetched on the read port side in advance of the DMA request received and buffered in the FIFO queue. Up to a full transfer block can be prefetched, although this can be limited by the specified maximum channel FIFO queue depth (see [Section 9.4.2, FIFO Queue Memory Pool](#)).

Buffering disable is not allowed for a destination-synchronized transfer.

**NOTE:** Behavior is undefined when prefetch is enabled and a transfer is synchronized to the source.

Whichever buffering is enabled or disabled, the last transaction in the frame or in the block is write nonposted (WNP) even if the write mode is specified as write last nonposted (WLNP; the WRITE\_MODE bit field of the SDMA.DMA4\_CSDPi register = 0x2). However, in a packet synchronization mode, the last transaction of each packet in the transfer is WNP only if the buffering disable is on (even if the write mode is specified as WLNP).

Regardless whether buffering disable is enabled or disabled, the packet interrupt is not generated in the packet source synchronized mode.

### CAUTION

The BUFFERING\_DISABLE bit field of the SDMA.DMA4\_CCRi register must be filled with an allowed value, as specified in [Table 9-7](#).

**Table 9-7. Buffering Disable**

	BUFFERING_DISABLE (0: buffering enable, 1: buffering disable)	
Destination synchronized	0	Allowed
	1	Not allowed
Source synchronized	0	Allowed
	1	Allowed

Synchronized transfer monitoring using CDAC (SDMA.DMA4\_CDACi):

Context is restored only when the channel becomes active on a DMA request (not at software enable). The channel is software-enabled first, and then a DMA request is asserted followed by the first context restore.

The CDAC register is writable; thus, you can initialize the CDAC to monitor the transfer and determine if the transfer is started or not.

**NOTE:** The CDAC register must be written or read so that the least-significant byte (LSByte) is read first; otherwise, the shadow registers do not update the CDAC registers.

This is not an issue for 32-bit read-write transactions. Nevertheless, for 16-bit transactions, start reading or writing the LSByte first to enable the register update.

### 9.4.8 Thread Budget Allocation

When several concurrent channels are latency critical and hardware synchronized, a specific latency cannot be ensured until the target is served. This situation occurs when the concurrent channel number is superior to the number of available threads.

**NOTE:** Four threads are available on the read port, and two threads are available on the write port.

For a hardware-synchronized transfer (memory to peripheral), a minimum bandwidth for a latency-critical transfer must be ensured to avoid collisions between two hardware requests.

Because it is latency critical, the software user is responsible for the following:

- Programming the synchronized channel as a high-priority channel
- Reserving one or several threads for high-priority channels

The proposed implementation is as follows (see [Section 9.5.5](#)):

Prevent the regular channel queue from exceeding more than a programmable (3, 2, or 1) number of threads on the read port and no more than one thread on the write port. This number can be set on the global register SDMA.DMA4\_GCR[13:12].

The thread reservation is programmable for maximum use of thread resources for concurrent, low-priority channel transfer. Programmability can also allow a partial throughput control by limiting in software the number of concurrent outstanding requests that break the pipelining.

Depending on the SDMA.DMA4\_GCR [13:12] value, the following threadID on the read/write ports are allocated for a high-priority channel:

Read port priority thread reservation:

- SDMA.DMA4\_GCR[13:12] = 0x0 => No ThreadID is allocated for high-priority channels.
- SDMA.DMA4\_GCR[13:12] = 0x1 => Read ThreadID 0 is allocated for high-priority channels.
- SDMA.DMA4\_GCR[13:12] = 0x2 => Read ThreadID 0 and Read ThreadID 1 are allocated for high-priority channels.
- SDMA.DMA4\_GCR[13:12] = 0x3 => Read ThreadID 0, Read ThreadID 1, and Read ThreadID 2 are allocated for high-priority channels.

Write port priority thread reservation:

- SDMA.DMA4\_GCR[13:12] = 0x0 => No ThreadID is allocated for high-priority channels
- SDMA.DMA4\_GCR[13:12] = 0x1 => Write ThreadID 0 is allocated for high-priority channels.
- SDMA.DMA4\_GCR[13:12] = 0x2 => Write ThreadID 0 is allocated for high-priority channels.
- SDMA.DMA4\_GCR[13:12] = 0x3 => Write ThreadID 0 is allocated for high-priority channels.

Regardless whether or not the enabled channels are of high priority, only the setting of the SDMA.DMA4\_GCR[13:12] value forces the thread reservation to these values. Set the appropriate value to avoid losing threads using only regular channels.

To have an independent read and write priority context, a per-channel bit SDMA.DMA4\_CCRi[26] is added for write priority, and the previous priority bit becomes read priority bit SDMA.DMA4\_CCRi[6].

---

**NOTE:** The device has one priority bit per logical channel, not one per port.

---

### 9.4.9 FIFO Budget Allocation

To avoid fully occupying the FIFO with a high-priority transfer while low-priority channels wait in the arbitration queue, two separate FIFO budgets are specified: one for high-priority channels and one for low-priority channels. This is defined in the SDMA.DMA4\_GCR register, allowing the user to share the FIFO budget between the low- and high-priority channels. The amount of the FIFO allocated by the low- and high-priority channels is fixed by the value set in the SDMA.DMA4\_GCR[15:14]

HI\_LO\_FIFO\_BUDGET field. The maximum channel FIFO depth is limited by the HI\_LO\_FIFO\_BUDGET field as follows:

If the channel is low priority:

- When HI\_LO\_FIFO\_BUDGET = 0x1, then low priority cannot exceed 75 percent of the total FIFO.
- When HI\_LO\_FIFO\_BUDGET = 0x2, then low priority cannot exceed 25 percent of the total FIFO.
- When HI\_LO\_FIFO\_BUDGET = 0x3, then low priority cannot exceed 50 percent of the total FIFO.

If channel is high priority

- When HI\_LO\_FIFO\_BUDGET = 0x1, then high priority cannot exceed 25 percent of the total FIFO.
- When HI\_LO\_FIFO\_BUDGET = 0x2, then high priority cannot exceed 75 percent of the total FIFO.
- When HI\_LO\_FIFO\_BUDGET = 0x3, then high priority cannot exceed 50 percent of the total FIFO.

The user is responsible for performing the following equation:

- For a high-priority channel: (Per\_Channel\_Maximum FIFO Depth + 1) x Number of High Channel =< High Budget FIFO
- For a low-priority channel: (Per\_Channel\_Maximum FIFO Depth + 1) x Number of Low Channel =< Low Budget FIFO

---

**NOTE:** Ensure that *Number of High Channel* means *Number of Active High-Priority Channel* and that *Number of Low Channel* means *Number of Active Low-Priority Channel*.

---

### 9.4.10 Chained Logical Channel Transfers

Chaining multiple logical channels permits transfers consisting of multiple parts to be executed without repeated software intervention. This results in better performance than the alternative of software setting up and starting each transfer separately. Each part of a chained transfer can have the data addressed in a different manner that permits the programming of a variety of complex transfers. For example:

- Interlaced video data with one logical channel configured to transfer the even lines and another logical channel configured to transfer the odd lines
- Protocol headers with a separate DMA4 channel configured to transfer each field in the header

Channels can be chained through each channel SDMA.DMA4\_CLNK\_CTRLi register. When the transfer for the first channel completes, the next channel in the chain is enabled. The number of channels in the chain that are configured for hardware-synchronized transfers is flexible (although typically it might be all, none, or just the first one). The DMA request line number should be set to 0 to specify that any or all of the channels in a chain are software-triggered or nonsynchronized.

The last channel in a chain can be chained to the first channel to create a continuously looping chain. The continuously looping transfer can be stopped on the fly at a specific channel by disabling the SDMA.DMA4\_CLNK\_CTRLi[15] ENABLE\_LNK bit. The looping transfer stops after the specified channel transfer is complete.

---

**NOTE: DMA Request Line**

A DMA request line must not be shared between concurrently enabled DMA channels. However, a DMA request line can be shared between several chained logical channels.

---

For more information on the programming model, see [Section 9.5, SDMA Basic Programming Model](#).

### 9.4.11 Reprogramming an Active Channel

A currently active logical DMA channel can be disabled through the SDMA.DMA4\_CCRi[7] ENABLE bit. When any ongoing transaction is complete and the read-active and write-active bits in the SDMA.DMA4\_CCRi register (SDMA.DMA4\_CCRi[9] RD\_ACTIVE and SDMA.DMA4\_CCRi[10] WR\_ACTIVE) are reset, the channel can be reprogrammed for a new transfer.

### 9.4.12 Interrupt Generation

The SDMA module has four interrupt request output lines, SDMA\_IRQ\_0 to SDMA\_IRQ\_3. One or more logical channels can be programmed to generate an interrupt request on any of these lines when any one of the maskable DMA events listed in [Table 9-8](#) occurs.

**Table 9-8. Logical DMA Channel Events**

Event	Description
End of packet	A packet transfer completed.
End of block	A block transfer completed.
End of frame	A frame transfer completed.
Half of frame	Half of the current frame transferred.
Start of last frame	The first element of the last frame transferred.
Transaction error	A transaction error returned by the interconnect in either the read or write port.
Address error	An attempt was made to perform a DMA access to an address not aligned on an ES boundary.
Secure transaction error (not available on GP device)	An attempt was made to set or modify the configuration of a channel specified as secure through a nonsecure access, or an attempt was made to perform a nonsecure DMA transfer to or from a secure region.

**Table 9-8. Logical DMA Channel Events (continued)**

Event	Description
Supervisor transaction error	An error occurred, for example, when an unauthorized initiator (that is, neither supervisor nor secure) tries to use a supervisor transfer.
Synchronization error	A new DMA request arrived before completion of the transfer because of the previous DMA request.
Drain end	Drain is completed (SDMA.DMA4_CCRi[10] WR_ACTIVE becomes 0).
System transaction error	An error has occurred, for example, when an unauthorized initiator tries to set a normal channel to a System channel or tries to change a System channel to a normal channel or tries to access (write) any register of a System channel registers.
Drop error	A drop event interrupt is generated when a DMA request is being serviced while a second one is asserted and a third one arrives before the second DMA request is serviced.

The logical DMA channels that generate an interrupt on a particular IRQ output are specified through the SDMA.DMA4\_IRQENABLE\_Lj register (where *j* is the IRQ number: 0, 1, 2, or 3). The events that generate an interrupt for a particular channel can be configured through the channel SDMA.DMA4\_CICRi register.

When an interrupt is detected, the logical DMA channel generating the event can first be identified by reading the SDMA.DMA4\_IRQSTATUS\_Lj register. The event causing the interrupt then can be identified by reading the interrupt status via the relevant DMA channel SDMA.DMA4\_CSRi register.

### 9.4.13 Packet Synchronization

A packet transfer notion is related to the behavior of some peripheral, which have certain buffering capability and requires to transfer the buffer content once an element number threshold is reached (a hardware DMA request is generated). To associate a frame synchronization to each DMA request is possible, but this limits the maximum transfer size. Indeed the maximum transfer size is proportional to the FIFO depth of the peripheral:

maximum\_transfer\_size = peripheral\_FIFO\_depth x number\_of\_frame\_in\_block.

The packet synchronization allows to dissociate the transfer size from the FIFO depth of the peripheral. Only Constant addressing mode is allowed on RD port or WR port if source target or destination target is packet synchronized respectively.

The main features of DMA Packet transfer are as follows:

- DMA Packet\_Data\_Size for each DMA Request: typically this will be Peripheral\_element\_number\_threshold Number of elements in a packet shares the SDMA.DMA4\_CSFli and SDMA.DMA4\_CDFli configuration registers. Indeed if the peripheral is the source target, respectively destination target, that means the used addressing mode is constant, consequently SDMA.DMA4\_CSFli[15:0], respectively SDMA.DMA4\_CDFli[15:0], is used to specify the packet data size (PKT\_ELNT\_NBR) and the bit fields [31:16] are unused. To specify the Packet data size in the SDMA.DMA4\_CSFli or SDMA.DMA4\_CDFli, the user must set the SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC respectively to 1 or 0.

---

**NOTE:** The packet size can be a sub-multiple or non sub-multiple of a frame size. If DMA Packet\_Data\_Size is aligned on DMA channel block data size boundary, then DMA will transfer the last data in channel block boundary, and stop at block boundary for the last packet DMA Request. If the Packet\_Data\_size is not aligned on the block boundary then the remaining data smaller than a packet size are transferred using burst or single accesses to complete the block

---

- DMA Packet\_Data\_Transfer does not affect DMA channel capabilities in term of packing and bursting. The Packet synchronization mode is active when SDMA.DMA4\_CCRi[5] FS = SDMA.DMA4\_CCRi[18] BS = 1. Then
  - if SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC=0; SDMA.DMA4\_CDFli[15:0] gives the number of element in packet and SDMA.DMA4\_CDFli[31:16] is unused for the packet size.
  - if SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC=1; SDMA.DMA4\_CSFli[15:0] gives the number of element in packet and SDMA.DMA4\_CSFli[31:16] is unused for the packet size.

**NOTE:** The maximum transfer size, regardless to the packet size, is always:  $\text{Block\_size} = \text{Number\_of\_Frame\_in\_Block} \times \text{Number\_of\_Element\_in\_Frame} \times \text{Element\_Size}$  If DMA channel packet/burst access across packet boundary, then DMA hardware will automatically split this packing/burst access into a multiple smaller accesses, which will be aligned on packet boundary. Otherwise, DMA will transfer data as usual packing/burst access.

#### 9.4.14 Graphics Acceleration Support

The SDMA supports two graphic acceleration features:

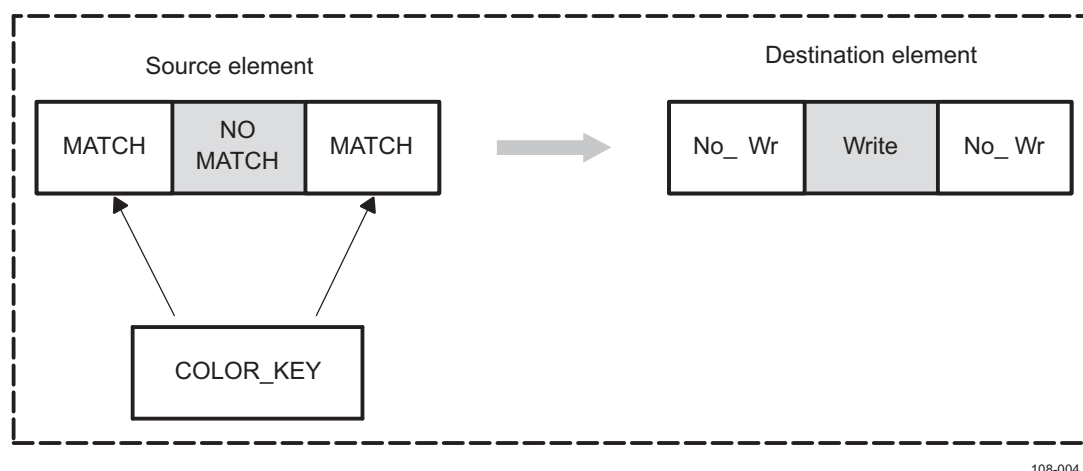

- Transparent copy
- Constant fill

Only one of these features can be enabled at any given time through the SDMA.DMA4\_CCRi register for the particular logical DMA channel.

The transparent copy feature enables specification of a particular color through the SDMA.DMA4\_COLORi register, so that when it is recognized in the data from the source, it is not copied to the corresponding location in the destination, but instead leaves the data in the corresponding location in the destination as it is.

Figure 9-12 shows the 2-D graphic transparent color block diagram.

**Figure 9-12. 2-D Graphic Transparent Color Block Diagram**

The constant fill feature provides the ability to specify a particular color through the SDMA.DMA4\_COLORi register for every specified location in the destination. In this case, the transfer consists only of writing to the destination without reading from a source.

Both features support 8 bpp (bits per pixel), 16 bpp, and 24 bpp, depending on what is specified as the DMA transfer ES via the SDMA.DMA4\_CSDPi register. An ES of 32 bits corresponds to 24 bpp. During a 32-bit (24 bpp) transfer, the most-significant 8 bits ([31:24]) are 0. Both features are compatible with packed and burst transactions.

#### 9.4.15 Secure (Not Available on GP Device) and Supervisor Modes

A logical DMA channel can be configured to operate either in secure mode (not available on GP device) and/or supervisor mode through the corresponding bits in the channel SDMA.DMA4\_CCRi register. This must be done using secure or supervisor access. Once a channel is configured either in secure or supervisor mode, the channel configuration is protected from nonsecure or nonsupervisor accesses. All DMA transactions on a secure or supervisor channel are secure or supervisor transactions.

A supervisor transaction is possible in secure mode, but a secure transaction is not possible in supervisor mode. Secure mode is not available on GP devices.

### 9.4.16 Posted and nonposted Writes

A logical channel can be configured in its DMA register bits SDMA.DMA4\_CSDPi[17:16] to use one of three write access handshake modes for the destination:

- nonposted write: Each write must complete before transfer can continue or complete.
- Posted write: Transfer continues without waiting for each write to complete (might improve performance with slow devices).
- Posted with final write nonposted: Transfer continues without waiting for each write to complete, but final write is completed before transfer can complete.

### 9.4.17 Disabling a Channel During Transfer

When a channel is disabled during a transfer, the channel will undergo an abort, except if the channel was hardware source synchronized with buffering Enabled (SDMA.DMA4\_CCRi[25] BUFFERING\_DISABLE='0'). In that case, the FIFO will be drained in order to avoid losing data. See [Section 9.4.18](#) for details on this feature.

### 9.4.18 FIFO Draining Mechanism

When a source synchronized channel is disabled during a transfer, then the current hardware request (element/packet/frame/block) service is completed and the channel SDMA.DMA4\_CCRi[9] RD\_ACTIVE bit is set to 0, which means the channel is not active on the read port. The remaining data in the corresponding disabled channel FIFO is drained onto the write port and transferred to the programmed destination as in normal transfer.

At the end of the draining the SDMA.DMA4\_CCRi[10] WR\_ACTIVE bit is set to 0 (channel is no more active on the write port) and if the SDMA.DMA4\_CICRi[12] DRAIN\_END\_IE is set to 1, the status bit DMA4\_CSRi[12] DRAIN\_END is updated and an interrupt is generated.

Once a channel is disabled during a transfer, it needs to wait for SDMA.DMA4\_CCRi[9] RD\_ACTIVE and SDMA.DMA4\_CCRi[10] WR\_ACTIVE to become '0' before being re-enabled for a new transfer. The FIFO drain for a channel will happen only in the following cases:

- If the channel is a source synchronized channel and SDMA.DMA4\_CCRi[25] BUFFERING\_DISABLE='0' and
- If the channel is not a solid fill channel and
- If the channel is not a transparent and copy channel

---

**NOTE:** In case of self-linked or chain-linked channel it is user responsibility to disable the SDMA.DMA4\_CLNK\_CTRLi[15] ENABLE\_LINK bit before disabling the channel.

---

In all other cases, the channel will undergo an abort.

### 9.4.19 Reset

Following a software or hardware reset, all fields in the logical channel registers have undefined values, except 5 bits in the SDMA.DMA4\_CCRi and SDMA.DMA4\_CICRi registers. Thus, when programming a channel for the first time, the remaining fields in all channel registers must be configured before enabling the channel.

---

**NOTE:** After a reset, the global registers take their specified reset values.

---

### 9.4.20 Power Management

The SDMA module provides two methods to reduce power consumption:

- Interconnect clock auto-idle
- Automatic standby mode

#### 9.4.20.1 Interconnect Clock Auto-Idle

The interconnect clock auto-idle power-saving mode is enabled or disabled in DMA register bit SDMA.DMA4\_OCP\_SYSCONFIG[0]. When this mode is enabled and there is no activity on the interconnect interface, the interconnect clock is disabled internally to the module to reduce power consumption. When there is new activity on the interconnect interface, the interconnect clock is restarted without any latency penalty. After reset, this mode is disabled by default. Enabling this mode is recommended to reduce power consumption.

#### 9.4.20.2 Automatic Standby Mode

As part of the system-wide power-management scheme, the module can go into a standby mode at the request of the power, reset, and clock management (PRCM) module (for more information, see the *Power, Reset, and Clock Management* chapter).

The module can be configured to one of the following standby modes using the DMA register bits SDMA.DMA4\_OCP\_SYSCONFIG[13:12]:

- No standby mode: The module never goes into standby mode.
- Force standby mode: The module goes into standby mode only when all the DMA channels are disabled.
- Smart standby mode: The module enters standby mode when:
  - All DMA channels are disabled.
  - No nonsynchronized channel is enabled, no DMA request line is asserted, and no DMA request is pending in the module.

## 9.5 SDMA Basic Programming Model

### 9.5.1 Setup Configuration

After a software or hardware reset, program all fields in the logical channel registers to default values for any channels used, because most fields are undefined following reset.

Before programming any DMA transfers, the priority arbitration rate and the maximum FIFO depth must be configured through the SDMA.DMA4\_GCR register, and any required interrupts must be enabled through the SDMA.DMA4\_IRQENABLE\_Lj registers and the logical channel SDMA.DMA4\_CICRi registers.

Software clears the SDMA.DMA4\_CSRi register and the IRQSTATUS bit for the different interrupt lines before enabling the channel.

### 9.5.2 Software-Triggered (nonsynchronized) Transfer

To program a software-triggered DMA transfer:

1. Configure the transfer parameters in the logical DMA channel registers:

- SDMA.DMA4\_CSDPi:
  - Transfer ES (8 bits, 16 bits, or 32 bits) and DMA register bits SDMA.DMA4\_CSDPi[1:0]
  - Read and write port access types (single/burst), DMA register bits SDMA.DMA4\_CSDPi[8:7] and SDMA.DMA4\_CSDPi[15:14]
  - Source and destination endianness, DMA register bits SDMA.DMA4\_CSDPi[21] and SDMA.DMA4\_CSDPi[19]
  - Write mode (posted or nonposted) and DMA register bits SDMA.DMA4\_CSDPi[17:16]
  - Source or destination packed or nonpacked (if the ES is less than the read/write port size), DMA register bits SDMA.DMA4\_CSDPi[6] and SDMA.DMA4\_CSDPi[13]
- SDMA.DMA4\_CENi: EN
- SDMA.DMA4\_CFNi: FN per transfer block
- SDMA.DMA4\_CSSAi and SDMA.DMA4\_CDSAi: source and destination start address (aligned with transfer ES)
- SDMA.DMA4\_CCRi:
  - Read and write port addressing modes, DMA register bits SDMA.DMA4\_CCRi[13:12] and SDMA.DMA4\_CCRi[15:14]
  - Priority bit for both read and write ports, DMA register bits SDMA.DMA4\_CCRi[6] and SDMA.DMA4\_CCRi[26]
  - DMA request number (set to 0 for a software-triggered transfer) and DMA register bits SDMA.DMA4\_CCRi[4:0] = 0 and SDMA.DMA4\_CCRi[20:19] = 0
- SDMA.DMA4\_CSEli, SDMA.DMA4\_CSFli, SDMA.DMA4\_CDEli, and SDMA.DMA4\_CDFli: source and destination element and frame indexes (depending on addressing mode)

2. Start the transfer through the enable bit in the channel SDMA.DMA4\_CCRi register and DMA register bit SDMA.DMA4\_CCRi[7]

The example below perform a DMA transfer on channel 10 of a 240\*160 picture from RAM to RAM (0x80C00000 to 0x80F00000) :

```
UWORD32 RegVal = 0;
DMA4_t *DMA4;

DMA4 = (DMA4_t *)malloc(sizeof(DMA4_t));

/* Init. parameters */
DMA4->DataType = 0x2; // DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0; // DMA4_CSDPi[8:7]
DMA4->WritePortAccessType = 0; // DMA4_CSDPi[15:14]
DMA4->SourceEndiansim = 0; // DMA4_CSDPi[21]
DMA4->DestinationEndianness = 0; // DMA4_CSDPi[19]
DMA4->WriteMode = 0; // DMA4_CSDPi[17:16]
DMA4->SourcePacked = 0; // DMA4_CSDPi[6]
DMA4->DestinationPacked = 0; // DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; // DMA4_CENi
DMA4->NumberOfFramePerTransferBlock = 160; // DMA4_CFNi
```

```

DMA4->SourceStartAddress = 0x80C00000;      // DMA4_CSSAi
DMA4->DestinationStartAddress = 0x80F00000; // DMA4_CDSAi
DMA4->SourceElementIndex = 1;              // DMA4_CSEli
DMA4->SourceFrameIndex = 1;               // DMA4_CSfli
DMA4->DestinationElementIndex = 1;        // DMA4_CDEli
DMA4->DestinationFrameIndex = 1;          // DMA4_CDFli
DMA4->ReadPortAccessMode = 1;             // DMA4_CCRi[13:12]
DMA4->WritePortAccessMode = 1;            // DMA4_CCRi[15:14]
DMA4->ReadPriority = 0;                    // DMA4_CCRi[6]
DMA4->WritePriority = 0;                   // DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0;              // DMA4_CCRi[4:0]
DMA4->WriteRequestNumber = 0;             // DMA4_CCRi[20:19]

/* 1) Configure the transfer parameters in the logical DMA registers */
/*-----*/

/* a) Set the data type CSDP[1:0], the Read/Write Port access type CSDP[8:7]/[15:14], the
Source/dest endianness CSDP[21]/CSDP[19], write mode
CSDP[17:16], source/dest packed or nonpacked CSDP[6]/CSDP[13]*/
// Read CSDP
RegVal = DMA4_CSDP_CH10;

// Build reg
RegVal = ((RegVal & ~0x3) | DMA4->DataType );
RegVal = ((RegVal & ~(0x3 << 7)) | (DMA4->ReadPortAccessType << 7));
RegVal = ((RegVal & ~(0x3 << 14)) | (DMA4->WritePortAccessType << 14));
RegVal = ((RegVal & ~(0x1 << 21)) | (DMA4->SourceEndiansim << 21));
RegVal = ((RegVal & ~(0x1 << 19)) | (DMA4->DestinationEndianness << 19));
RegVal = ((RegVal & ~(0x3 << 16)) | (DMA4->WriteMode << 16));
RegVal = ((RegVal & ~(0x1 << 6)) | (DMA4->SourcePacked << 6));
RegVal = ((RegVal & ~(0x1 << 13)) | (DMA4->DestinationPacked << 13));

// Write CSDP
DMA4_CSDP_CH10 = RegVal;

/* b) Set the number of element per frame CEN[23:0]*/
DMA4_CEN_CH10 = DMA4->NumberOfElementPerFrame;

/* c) Set the number of frame per block CFN[15:0]*/
DMA4_CFN_CH10 = DMA4->NumberOfFramePerTransferBlock;

/* d) Set the Source/dest start address index CSSA[31:0]/CDSA[31:0]*/
DMA4_CSSA_CH10 = DMA4->SourceStartAddress; // address start
DMA4_CDSA_CH10 = DMA4->DestinationStartAddress; // address dest

/* e) Set the Read Port addressing mode CCR[13:12], the Write Port addressing mode CCR[15:14],
read/write priority CCR[6]/CCR[26], the current LCH CCR[20:19]=00 and CCR[4:0]=00000*/
// Read CCR
RegVal = DMA4_CCR_CH10;

// Build reg
RegVal = ((RegVal & ~(0x3 << 12)) | (DMA4->ReadPortAccessMode << 12));
RegVal = ((RegVal & ~(0x3 << 14)) | (DMA4->WritePortAccessMode << 14));
RegVal = ((RegVal & ~(0x1 << 6)) | (DMA4->ReadPriority << 6));
RegVal = ((RegVal & ~(0x1 << 26)) | (DMA4->WritePriority << 26));

RegVal&= 0xFFCFFFE0 ;

// Write CCR
DMA4_CCR_CH10 = RegVal;

/* f)- Set the source element index CSEI[15:0]*/
DMA4_CSEli_CH10 = DMA4->SourceElementIndex;

/* - Set the source frame index CSFI[15:0]*/
DMA4_CSfli_CH10 = DMA4->SourceFrameIndex ;

```

```

/*      - Set the destination element index CDEI[15:0]*/
DMA4_CDEli_CH10 = DMA4->DestinationElementIndex;

/*      - Set the destination frame index CDFI[31:0]*/
DMA4_CDFli_CH10 = DMA4->DestinationFrameIndex;

/* 2) Start the DMA transfer by Setting the enable bit CCR[7]=1 */
/*-----*/
//write enable bit

```

### 9.5.3 Hardware-Synchronized Transfer

To monitor a hardware synchronized DMA transfer, initialize the SDMA.DMA4\_CDACi register before the software enable.

To configure an LCh to synchronize by element, packet, frame, or block, the frame synchronization SDMA.DMA4\_CCRi[5] FS bit and the block synchronization SDMA.DMA4\_CCRi[18] BS bit register must be programmed. For all the following synchronized transfers (element, packet, frame or block synchronized transfers) User must set first : SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC to 1 when the source triggers on the DMA request and SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC to 0 when the Destination triggers on the DMA request. Note: User must take care when setting the SDMA.DMA4\_CCRi[23] PREFETCH bit it is in conjunction with SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC bit .

- To configure an LCh to transfer one element per DMA request:
  1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER and SDMA.DMA4\_CCRi[4:0] SYNCHRO bitfield
  2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4\_CSDPi[1:0] DATA\_TYPE bitfield
  3. Set the Read Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[8:7] SRC\_BURST\_EN bitfield
  4. Set the Write Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[15:14] DST\_BURST\_EN bitfield
  5. Set the Read Port addressing mode in the SDMA.DMA4\_CCRi[13:12] SRC\_AMODE bitfield.
  6. Set the Write Port addressing mode in the SDMA.DMA4\_CCRi[15:14] DST\_AMODE bitfield
  7. Set the Read start address in the SDMA.DMA4\_CSSAi[31:0] SRC\_START\_ADRS bitfield
  8. Set the Write start address in the SDMA.DMA4\_CDSAi[31:0] DST\_START\_ADRS bitfield
  9. Set both FS and BS to 0 in SDMA.DMA4\_CCRi[5] FS and SDMA.DMA4\_CCRi[18] BS
  10. Set to 1 the channel enable bit SDMA.DMA4\_CCRi[7] EN bit
- To configure an LCh to transfer one frame per DMA request:
  1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER and SDMA.DMA4\_CCRi[4:0] SYNCHRO bitfield
  2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4\_CSDPi[1:0] DATA\_TYPE bitfield
  3. Set the number of element per frame in the SDMA.DMA4\_CENi[23:0] CHANNEL\_ELMNT\_NBR bitfield
  4. Set the Read Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[8:7] SRC\_BURST\_EN bitfield
  5. Set the Write Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[15:14] DST\_BURST\_EN bitfield
  6. Set the Read Port addressing mode in the SDMA.DMA4\_CCRi[13:12] SRC\_AMODE bitfield.
  7. Set the Write Port addressing mode in the SDMA.DMA4\_CCRi[15:14] DST\_AMODE bitfield
  8. Set the Read start address in the SDMA.DMA4\_CSSAi[31:0] SRC\_START\_ADRS bitfield
  9. Set the Write start address in the SDMA.DMA4\_CDSAi[31:0] DST\_START\_ADRS bitfield
  10. Set FS to 1 and BS to 0 respectively in SDMA.DMA4\_CCRi[5] FS and SDMA.DMA4\_CCRi[18] BS
  11. Set to 1 the channel enable bit SDMA.DMA4\_CCRi[7] EN bit

- To configure an LCh to transfer one block per DMA request:
  1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER and SDMA.DMA4\_CCRi[4:0] SYNCHRO bitfield
  2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4\_CSDPi[1:0] DATA\_TYPE bitfield
  3. Set the number of element per frame in the SDMA.DMA4\_CENi[23:0] CHANNEL\_ELMNT\_NBR bitfield
  4. Set in the SDMA.DMA4\_CFNi[15:0] CHANNEL\_FRAME\_NBR bitfield the number of frame (transfers), to take place before the LCH gets disabled
  5. Set the Read Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[8:7] SRC\_BURST\_EN bitfield
  6. Set the Write Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[15:14] DST\_BURST\_EN bitfield
  7. Set the Read Port addressing mode in the SDMA.DMA4\_CCRi[13:12] SRC\_AMODE bitfield.
  8. Set the Write Port addressing mode in the SDMA.DMA4\_CCRi[15:14] DST\_AMODE bitfield
  9. Set the Read start address in the SDMA.DMA4\_CSSAi[31:0] SRC\_START\_ADRS bitfield
  10. Set the Write start address in the SDMA.DMA4\_CDSAi[31:0] DST\_START\_ADRS bitfield
  11. Set FS to 0 and BS to 1 respectively in SDMA.DMA4\_CCRi[5] FS and SDMA.DMA4\_CCRi[18] BS
  12. Set to 1 the channel enable bit SDMA.DMA4\_CCRi[7] EN bit
- To configure an LCh to transfer one packet per DMA request:
  1. Set the number of DMA request associated to the current LCH in the SDMA.DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER and SDMA.DMA4\_CCRi[4:0] SYNCHRO bitfield
  2. Set the data type, also referenced as element size (ES), in the SDMA.DMA4\_CSDPi[1:0] DATA\_TYPE bitfield
  3. Set the number of element per packet to transfer: If the packet requestor is in the source then set SDMA.DMA4\_CCR.Sel\_Src\_Dst\_Sync to 1 and set the packet element number in the SDMA.DMA4\_CSFi register. Else if the packet requestor is in the destination then set SDMA.DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC to 0 and set the packet element number in the SDMA.DMA4\_CDFi register.
  4. Set the number of element per frame in the SDMA.DMA4\_CENi[23:0] CHANNEL\_ELMNT\_NBR bitfield
  5. Set in the SDMA.DMA4\_CFNi[15:0] CHANNEL\_FRAME\_NBR bitfield the number of frame (transfers), to take place before the LCH gets disabled
  6. Set the element number in the packet in the SDMA.DMA4\_CSFi[15:0] PKT\_ELNT\_NBR, if constant addressing or post-incremented addressing modes are used in the source side. However, the number of element in the packet is set in the SDMA.DMA4\_CDFi[15:0] PKT\_ELNT\_NBR if constant addressing mode is used in the destination side.
  7. Set the Read Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[8:7] SRC\_BURST\_EN bitfield
  8. Set the Write Port access type (single or burst access) in the SDMA.DMA4\_CSDPi[15:14] DST\_BURST\_EN bitfield
  9. Set the Read Port addressing mode in the SDMA.DMA4\_CCRi[13:12] SRC\_AMODE bitfield.
  10. Set the Write Port addressing mode in the SDMA.DMA4\_CCRi[15:14] DST\_AMODE bitfield
  11. Set the Read start address in the SDMA.DMA4\_CSSAi[31:0] SRC\_START\_ADRS bitfield
  12. Set the Write start address in the SDMA.DMA4\_CDSAi[31:0] DST\_START\_ADRS bitfield
  13. Set FS to 1 and BS to 1 respectively in SDMA.DMA4\_CCRi[5] FS and SDMA.DMA4\_CCRi[18] BS
  14. Set to 1 the channel enable bit SDMA.DMA4\_CCRi[7] EN bit

---

**NOTE:** It is possible to stop a transfer by disabling the channel. This is done by reset the ENABLE bit in the SDMA.DMA4\_CCRi register.

---

### 9.5.4 Synchronized Transfer Monitoring using CDAC

The SDMA.DMA4\_CDACi register is writable and noninitialized (value undefined). It can be initialized to monitor a transfer by applying the following programming model:

1. Write 0 in the SDMA.DMA4\_CDACi
2. Enable the channel.
3. If time-out occurs, read SDMA.DMA4\_CDACi
4. If SDMA.DMA4\_CDACi != SDMA.DMA4\_CDACi reset value:  
Then transfer starts. User can then rely on SDMA.DMA4\_CCENi and SDMA.DMA4\_CCFNi element and frame counters.  
Else, if SDMA.DMA4\_CDACi = SDMA.DMA4\_CDACi reset value:  
Then transfer does not start.

### 9.5.5 Concurrent Software and Hardware Synchronization

This section describes thread allocation only and not the entire transfer. Because synchronized transfers are latency critical, you must allocate a thread on the synchronized target side at least.

Even for multiple concurrent channels, thread reservation guarantees that as soon as an HW DMA request comes in, the read/write scheduler finds available thread(s) to initiate a channel schedule and issue a read/write transaction.

Consider these six concurrent channels:

- Channels 0/1/2/3 are dedicated to memory-memory transfer: they are software triggered and not synchronized.
  - Channel 4 is dedicated to memory→peripheral transfer, hardware triggered, and synchronized on the write side.
  - Channel 5 is dedicated to peripheral→memory transfer, hardware triggered, and synchronized on the read side.
1. Allow thread reservation for priority channel 4 and channel 5:  
Reserve one thread (Read ThreadID 0) on the read port: set SDMA.DMA4\_GCR[13:12] = 0x1.  
Reserve one thread (Write ThreadID 0) on the write port: set SDMA.DMA4\_GCR[13:12] = 0x1.
  2. Specify channel priority:  
Channel 4 is a write high priority channel: set SDMA.DMA4\_CCRi[26] = 1.  
Channel 5 is a read high priority channel: set SDMA.DMA4\_CCRi[6] = 1.

### 9.5.6 Chained Transfer

A chained DMA transfer can be programmed as follows:

1. Configure the transfer parameters for each logical DMA channel in the chain as in step 1 for either the synchronized or nonsynchronized transfers above.
2. For each channel in the chain, configure the SDMA.DMA4\_CLNK\_CTRLi register as follows:
  - Next logical DMA channel number (for a looping chained transfer link last channel to first channel number), in DMA register bits SDMA.DMA4\_CLNK\_CTRLi[4:0].
  - Include the logical channel to the chain and enable link by setting the DMA register bit SDMA.DMA4\_CLNK\_CTRLi[15].
  - For a nonlooping chain, the last logical channel in the chain must have the DMA register bit SDMA.DMA4\_CLNK\_CTRLi[15] set to 0 to indicate the end of the chain.
3. Enable the transfer via the enable bit in the first logical channel DMA register bit SDMA.DMA4\_CCRi[7]. All other channels in the chain must be configured as disabled. Each channel is enabled automatically in turn when the previous logical channel transfer completes. A nonsynchronized transfer starts immediately; a hardware-synchronized transfer starts when the DMA request line corresponding to the first DMA channel in the chain is asserted.

To stop a looping chained transfer, disable the NEXTLCH\_ID bit, DMA register bit SDMA.DMA4\_CLNK\_CTRLi[15](ENABLE\_LNK bit set to 0x0), of the final channel transfer.

In the RAM to RAM copy example, to copy in loop it's possible to link channel 10 on itself. The following line can be added in the channel configuration :

```
/* g) Set link for loop */
DMA4_CLINK_CTRL_CH10 = 0x0000800A;
```

### 9.5.7 90° Clockwise Image Rotation

The 90° clockwise image rotation example described in [Section 9.4.3, Addressing Modes](#), can be programmed as follows:

1. Configure the transfer parameters in the logical DMA channel registers:

- SDMA.DMA4\_CSDPi:
  - Transfer ES = 32-bit (32 bpp), DMA register bits SDMA.DMA4\_CSDPi[1:0]
  - Read and write port access types = maximum burst size supported by memory device, DMA register bits SDMA.DMA4\_CSDPi[8:7] and SDMA.DMA4\_CSDPi[15:14]
  - Source and destination endianness, DMA register bits SDMA.DMA4\_CSDPi[21] and SDMA.DMA4\_CSDPi[19]
  - Write mode = posted with last element nonposted, DMA register bits SDMA.DMA4\_CSDPi[17:16]
  - Source and destination packed = Yes (although destination writes will not benefit because EI>1), DMA register bits SDMA.DMA4\_CSDPi[6] and SDMA.DMA4\_CSDPi[13]
- SDMA.DMA4\_CENi: EN = 240
- SDMA.DMA4\_CFNi: FN per transfer block = 160
- SDMA.DMA4\_CSSAi: source start address = 0x100000
- SDMA.DMA4\_CDSAi: destination start address = 0x20013E
- SDMA.DMA4\_CCRi:
  - Read and write port addressing modes = double-index addressing mode for both or post-increment addressing on source and double-index addressing on destination, DMA register bits SDMA.DMA4\_CCRi[13:12] and SDMA.DMA4\_CCRi[15:14]
  - Low or high priority, DMA register bit SDMA.DMA4\_CCRi[6]
  - DMA request number = 0 (for software-triggered transfer), DMA register bits SDMA.DMA4\_CCRi[4:0] and SDMA.DMA4\_CCRi[20:19]
- SDMA.DMA4\_CSEli: source EI = 1
- SDMA.DMA4\_CSFli: source frame index = 1
- SDMA.DMA4\_CDEli: destination EI = 637
- SDMA.DMA4\_CDFli: destination frame index = -152967

2. Start the transfer via the enable bit in the channel SDMA.DMA4\_CCRi register.

Below are the parameters to perform this rotation from 0x80C00000 RAM address to 0x80F00000, with the same code as in [Section 9.5.2](#):

```
/* Init. parameters */
DMA4->DataType = 0x2; // DMA4_CSDPi[1:0]
DMA4->ReadPortAccessType = 0x3; // DMA4_CSDPi[8:7]
DMA4->WritePortAccessType = 0x3; // DMA4_CSDPi[15:14]
DMA4->SourceEndiansim = 0; // DMA4_CSDPi[21]
DMA4->DestinationEndianness = 0; // DMA4_CSDPi[19]
DMA4->WriteMode = 0x2; // DMA4_CSDPi[17:16]
DMA4->SourcePacked = 0x1; // DMA4_CSDPi[6]
DMA4->DestinationPacked = 0x1; // DMA4_CSDPi[13]
DMA4->NumberOfElementPerFrame = 240; // DMA4_CENi
DMA4->NumberOfFramePerTransferBlock = 160; // DMA4_CFNi
DMA4->SourceStartAddress = 0x80C00000; // DMA4_CSSAi
DMA4->DestinationStartAddress = 0x80F00000; // DMA4_CDSAi
DMA4->SourceElementIndex = 1; // DMA4_CSEli
DMA4->SourceFrameIndex = 1; // DMA4_CSFli
DMA4->DestinationElementIndex = 637; // DMA4_CDEli
DMA4->DestinationFrameIndex = -152967; // DMA4_CDFli
DMA4->ReadPortAccessMode = 0x3; // DMA4_CCRi[13:12]
DMA4->WritePortAccessMode = 0x3; // DMA4_CCRi[15:14]
DMA4->ReadPriority = 0; // DMA4_CCRi[6]
DMA4->WritePriority = 0; // DMA4_CCRi[23]
DMA4->ReadRequestNumber = 0; // DMA4_CCRi[4:0]
DMA4->WriteRequestNumber = 0; // DMA4_CCRi[20:19]
```

## 9.5.8 Graphic Operations

- Transparent copy :
  - 1. Set the SDMA.DMA4\_CCRi[17] Transparent\_Copy\_Enable bitfield to 1
  - 2. Set the SDMA.DMA4\_CCRi[16] Constant\_Fill\_Enable bitfield to 0
  - 3. Set the value of key the color in the SDMA.DMA4\_COLORi[15:0] color\_key bitfield

To perform this graphic operation, the following lines can be added to the example of [Section 9.5.2](#)

```
DMA4_CCR_CH10 &= ~(0x1 << 16);
DMA4_CCR_CH10 |= 0x1 << 17;
DMA4_COLOR_CH10 = 0x00000003;
```

- Solid Color fill :
  - 1. Set the SDMA.DMA4\_CCRi[16] Constant\_Fill\_Enable bitfield to 1
  - 2. Set the SDMA.DMA4\_CCRi[17] Transparent\_Copy\_Enable bitfield to 0
  - 3. Set the value of key the color in the DMA4\_COLORi[15:0] solid\_color bitfield

To perform this graphic operation, the following lines can be added to the example of [Section 9.5.2](#)

```
DMA4_CCR_CH10 &= ~(0x1 << 17);
DMA4_CCR_CH10 |= 0x1 << 16;
DMA4_COLOR_CH10 = 0x00000003;
```

## 9.6 SDMA Use Cases and Tips

### 9.6.1 Camcorder Use Case: How to Configure SDMA to Handle Transfers with McBSP2 and MMC to External DRAM

#### 9.6.1.1 Introduction

In this use case, the SDMA manages:

- The audio stream between the McBSP and the external DRAM
- The audio stream between the external DRAM and the MMC buffer
- The video stream between the external DRAM and the MMC buffer

The following sections describe how to configure the SDMA controller with MMC and McBSP in this use case.

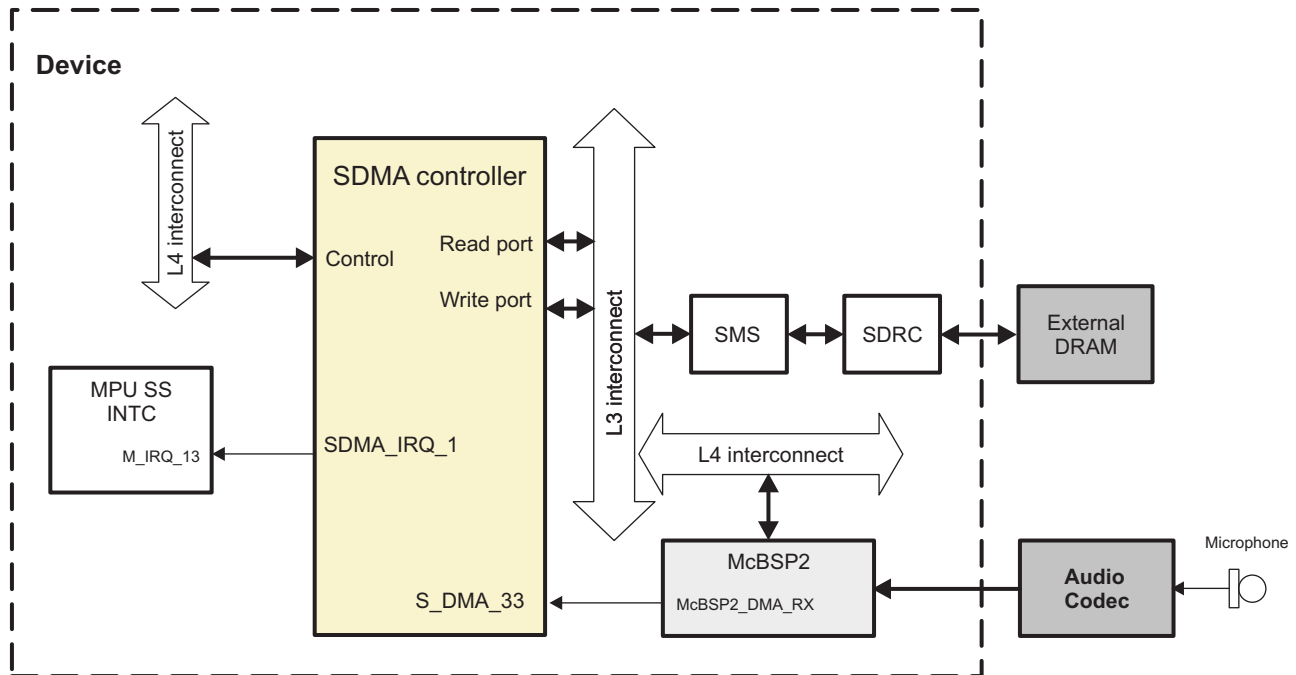

#### 9.6.1.2 SDMA Configuration to Transfer Data Between the McBSP and External DRAM

##### 9.6.1.2.1 Overview

The SDMA gets data from the McBSP\_DRR register and copies it into three rolling buffers in the external DRAM.

[Figure 9-13](#) is an overview of the audio path.

Figure 9-13. Overview

108-030

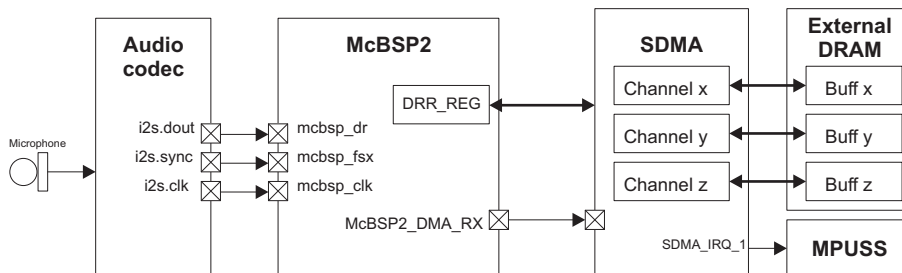

For the camcorder use case, the DMA transfer data format is:

- Frame size = 2048 x 32 bits
- Three DMA channels to manage three transfers to three memory buffers
- Interrupt generated at the end of each frame transfer
- Transfer triggered by McBSP2

### 9.6.1.2.2 Environment

The DMA accesses MCBSP2\_DRR\_REG through the interconnect and receives a DMA request from this McBSP module for driving transfers. The DMA accesses the external DRAM through the interconnect. The McBSP is directly connected to the audio codec. Figure 9-14 shows the environment of this scenario.

Figure 9-14. Environment

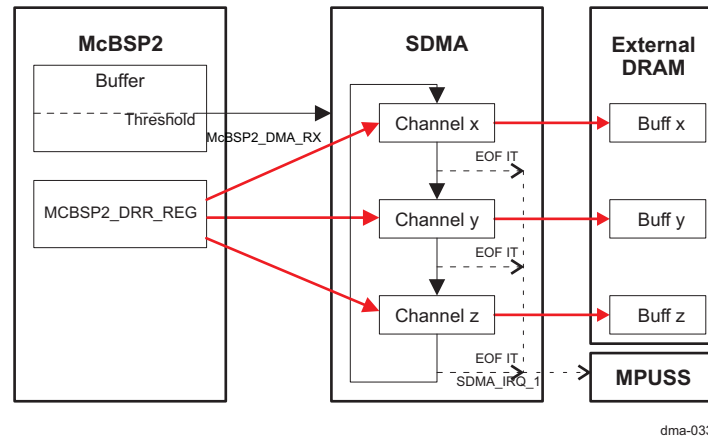

dma-032

### 9.6.1.2.3 Data Path

The transfer is started when the DMA transfer is enabled and the MCBSP2\_DMA\_REQ is asserted (that is, when the MCBSP FIFO threshold is reached). The DMA starts copying the first frame into the first memory buffer. When a whole frame has been transferred (2048 data), an interrupt is asserted to the MPU, and then the second channel is enabled and fills the second buffer, and so on. Figure 9-15 shows the data flow.

**Figure 9-15. Data Flow**

### 9.6.1.2.4 Programming Flow

To establish a configuration for the DMA transfers, the following points have been considered.

The MCBSP2\_DRR\_REG register is 32 bits wide, but in the camcorder use case, only the 16 LSBs are used (monophonic 16-bit-wide audio channel).

The McBSP receives data in a FIFO buffer. As long as the occupied locations level in this read buffer is greater than or equal to the threshold value + 1, the DMA request is asserted. After transferring the configured (THRSH1\_REG value + 1) number of words, the receive DMA request is de-asserted and then reasserted when the conditions are met again. Therefore, the DMA can receive at least threshold value data, with a threshold maximum value = 1280 elements = size of McBSP2 FIFO.

The frame synchronization transfer mode of the SDMA can be used with McBSP for frames with a size equal to the threshold. In the use case, however, the audio data frame is equal to 2048 elements, which is greater than the maximum transfer length possible with the McBSP.

Because the SDMA cannot be configured in frame synchronization mode, packet synchronization mode must be used. This mode enables to specify the maximum size of a transfer and to divide a frame into as many packet as needed. It is then possible to configure a frame of  $n$  elements and generate an interrupt at the end-of-frame transfer, while the transfer is segmented into packets.

The management of the three memory buffers is done by configuring three DMA channels linked between themselves: channel x is linked to channel y, channel y is linked to channel z, and channel z is linked to channel x. The three channels have the same configuration, except for the destination address, which corresponds to the three buffer addresses. Channels 11, 12, and 13 are used. Each channel generates the end-of-frame interrupts on the L1 interrupt line of the SDMA, to warn the MPU of the end of a frame transfer.

With these considerations, the DMA register of the three channels ( $i = 11, 12, \text{ and } 13$ ) is configured as follows:

1. Channel source destination parameters: DMA4\_CSDPi
  - DMA4\_CSDPi[1:0] DATA\_TYPE = 0x1: Read 16-bit elements from the MCBSP\_DRR\_REG register.
  - DMA4\_CSDPi[5:2] RESERVED: Write 0's for future compatibility. Read returns 0.
  - DMA4\_CSDPi[6] SRC\_PACKED = 0x0: Cannot pack source data
  - DMA4\_CSDPi[8:7] SRC\_BURST\_EN = 0x0: Cannot burst source

- DMA4\_CSDPi[12:9] RESERVED: Write 0s for future compatibility. Read returns 0.
  - DMA4\_CSDPi[13] DST\_PACKED = 0x1: Pack two 16-bit elements in one 32-bit packet to optimize transfer.
  - DMA4\_CSDPi[15:14] DST\_BURST\_EN = 0x3: Burst at 16x32-bit
  - DMA4\_CSDPi[17:16] WRITE\_MODE = 0x1: Write posted
  - DMA4\_CSDPi[18] DST\_ENDIAN\_LOCK = 0x0: Endianness adapt
  - DMA4\_CSDPi[19] DST\_ENDIAN = 0x0: Little endian type at destination
  - DMA4\_CSDPi[20] SRC\_ENDIAN\_LOCK = 0x0: Endianness adapt
  - DMA4\_CSDPi[21] SRC\_ENDIAN = 0x0: Little endian type at source
  - DMA4\_CSDPi[31:22] RESERVED = 0x0: For future compatibility
2. Channel control register: DMA4\_CCRi
- DMA4\_CCRi[4:0] SYNCHRO\_CONTROL = DmaReq & 0x1F = 0x2: 5 first bits of McBSP2\_DMA\_RX
  - DMA4\_CCRi[5] FS = 1: Packet mode with BS = 0x1
  - DMA4\_CCRi[6] READ\_PRIORITY = 0x0: Low priority on read side
  - DMA4\_CCRi[7] ENABLE = 0x0: The logical channel is disabled.
  - DMA4\_CCRi[8] SUSPEND\_SENSITIVE = 0
  - DMA4\_CCRi[9] RD\_ACTIVE: Read status, read-only access
  - DMA4\_CCRi[10] WR\_ACTIVE: Write status, read-only access
  - DMA4\_CCRi[11] RESERVED = 0: Write 0's for future compatibility.
  - DMA4\_CCRi[13:12] SRC\_AMODE = 0x0: Constant address mode; DMA always reads McBSP2\_DRR\_REG.
  - DMA4\_CCRi[15:14] DST\_AMODE = 0x1: Post-incremented address mode
  - DMA4\_CCRi[16] CONST\_FILL\_ENABLE = 0x0: Constant fill mode is disabled.
  - DMA4\_CCRi[17] TRANSPARENT\_COPY\_ENABLE = 0x0: Transparent copy mode is disabled.
  - DMA4\_CCRi[18] BS = 0x1: Packet mode with FS = 0x1
  - DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER = 0x1: Two MSBs of McBSP2\_DMA\_RX
  - DMA4\_CCRi[21] SECURE = 0x0: Channel secure mode is disabled.
  - DMA4\_CCRi[22] SUPERVISOR = 0x0: Supervisor mode is disabled.
  - DMA4\_CCRi[23] PREFETCH = 0x0: Prefetch mode is disabled, cannot prefetch a constant addressing source.
  - DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC = 0x1: Transfer is triggered by the source. The packet element number is specified in the DMA4\_CSFlI register.
  - DMA4\_CCRi[25] BUFFERING\_DISABLE = 0x0
  - DMA4\_CCRi[26] WRITE\_PRIORITY = 0x0: Channel has low priority on Write side during the arbitration process.
  - DMA4\_CCRi[31:27] RESERVED = 0x0: Write 0's for future compatibility.
3. Channel parameters: DMA4\_CENi, DMA4\_CFNi, DMA4\_CSSAi, DMA4\_CDSAi, DMA4\_CSEli, DMA4\_CSFli, DMA4\_CDEli
- DMA4\_CENi[23:0] CHANNEL\_ELMNT\_NBR = 2048: 2048 elements
  - DMA4\_CFNi[15:0] CHANNEL\_FRAME\_NBR = 1: One frame
  - DMA4\_CSSAi[31:0] SRC\_START\_ADRS = 0x49022000: Channel source start address = MCBSP2\_DRR\_REG
  - DMA4\_CDSAi[31:0] DST\_START\_ADRS= X, Y or Z: Channel destination start address in external DRAM, where X, Y, and Z represent the addresses of the three buffers
  - DMA4\_CSEli[31:0] CHANNEL\_SRC\_ELMNT\_INDEX = 1: Channel source element index
  - DMA4\_CSFli[15:0] 16BIT\_PKT\_ELNT\_NBR = 0x80: 16-bit Packet size = MCBSP\_FIFO\_THRESHOLD + 1
  - DMA4\_CDEli[15:0] CHANNEL\_DST\_ELMNT\_INDEX = 0x1: Channel destination element index
4. Channel linking: DMA4\_CLNK\_CTRLi
- DMA4\_CLNK\_CTRL11[31:0] = 0x0000800C: Channel 11 is linked to channel 12.
  - DMA4\_CLNK\_CTRL12[31:0] = 0x0000800D: Channel 12 is linked to channel 13.
  - DMA4\_CLNK\_CTRL13[31:0] = 0x0000800B: Channel 13 is linked to channel 11.
5. Interrupt management: DMA4\_CICRi and DMA4\_IRQENABLE\_Lj
- DMA4\_CICRi[31:0] = 0x00000008: Enables the end of frame interrupt and disables others (the value of these registers is unknown after a reset; it is necessary to clear other bits)
  - DMA4\_IRQENABLE\_L1[31:0] = 0x00022800; interrupts of channels 11, 12, and 13 are unmasked on IRQ line L1.

6. Launch transfer: DMA4\_CCRi[7] ENABLE = 0x1: Enables the three channels, starting with channel 13, then 12, and finally 11; the last one triggers the others.

Table 9-9 lists the registers of DMA channel 11 after a first transfer.

**Table 9-9. Registers Print**

Register Name	Address	Value	Value Description
DMA4_IRQENABLE_L1	0x4805601c	0x00022800	Interrupts of channels 11, 12, and 13 are unmasked on IRQ line L1.
DMA4_CICR11	0x480564a8	0x00000008	End-of-frame interrupt enabled
DMA4_CCR11	0x480564a0	0x010c40a2	Channel control register
DMA4_CSDP11	0x480564b0	0x0001e001	Channel source destination parameters
DMA4_CEN11	0x480564b4	0x00000800	Channel element number
DMA4_CFN11	0x480564b8	0x00000001	Channel frame number
DMA4_CSSA11	0x480564bc	0x49022000	Channel source start address
DMA4_CDSA11	0x480564c0	0x81e00000	Channel destination start address
DMA4_CSF11	0x480564c8	0x00000080	Packet size
DMA4_CSAC11	0x480564d4	0x49022000	Source address counter (read only)
DMA4_CDAC11	0x480564d8	0x81e01000	Destination address counter (read only)
DMA4_CCEN11	0x480564dc	0x00000800	Channel current transferred element number in the current frame (read only)
DMA4_CCFN11	0x480564e0	0x00000001	Channel current transferred frame number in the current transfer (read only)
DMA4_CLNK_CTRL11	0x480564a4	0x0000800C	Channel link control register: Link to channel 12

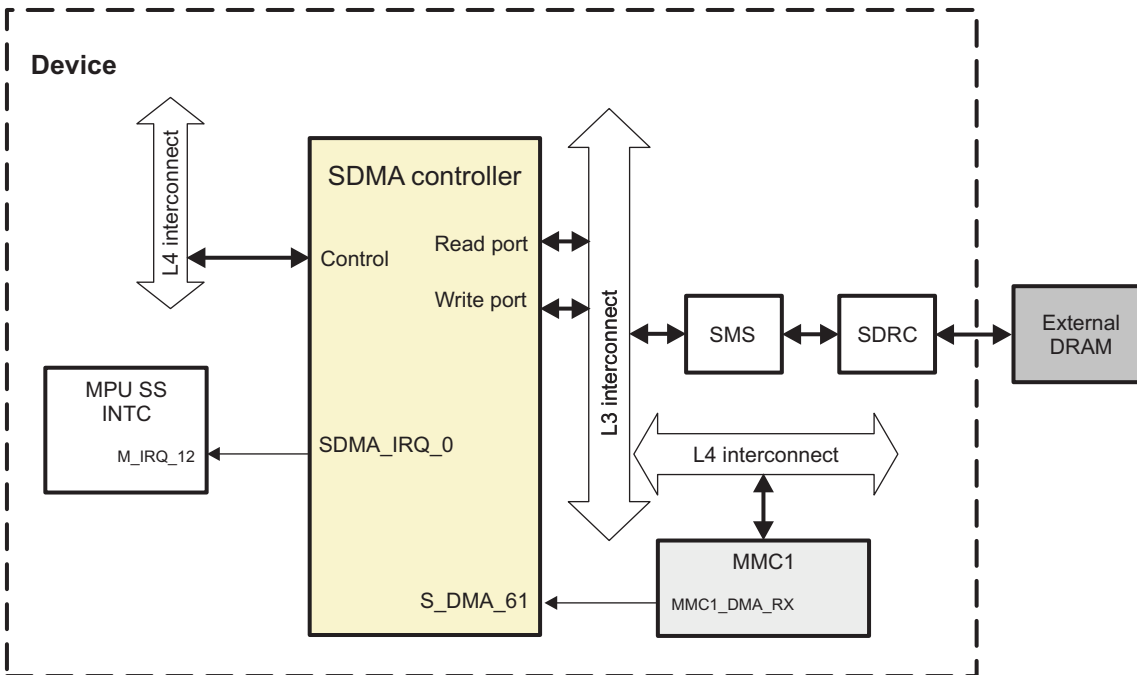

Channels 12 and 13 have a similar configuration; only the destination address and channel link change.

### 9.6.1.3 SDMA Configuration to Transfer Data Between MMC and External DRAM

#### 9.6.1.3.1 Overview

The SDMA gets data from the MMC.MMCHS\_DATA register and copies it into the external DRAM. The SDMA accesses the MMCHS\_DATA through the interconnect and receives a DMA request from the MMC module for driving transfers. The DMA accesses the external DRAM through the interconnect. The transfer is started when the DMA transfer is enabled and the MMC1\_DMA\_REQ is asserted (that is, when the MMC buffer is ready).

Figure 9-16 is an overview of the path.

**Figure 9-16. Overview**

108-031

For the camcorder use case, the DMA transfer data format is:

- Frame size = 4096 x 32 bits
- packet size = 512 x 32 bits (512 elements ready in MMC when a DMA request is asserted)
- DMA channel to manage the transfer
- Interrupt generated at the end of each frame transfer
- Transfer triggered by MMC

### 9.6.1.3.2 Programming Flow

To establish a configuration for the DMA transfers, the following points have been considered.

The MMCHS\_DATA register is 32 bits wide.

The SDMA is configured in packet synchronization mode. This mode enables to specify the transfer of any size frame and then to divide the frame into as many packet as needed. It is therefore possible to configure a frame of  $n$  elements and generate an interrupt at the end-of-frame transfer, while the transfer is segmented into packets.

The MMC puts its received data into a 1K-byte ping-pong buffer. When 512 x 32 bits are ready in this buffer, the DMA request is asserted. Then the DMA controller transfers the defined amount of elements divided into packets of 512 x 32-bit element (PKT\_ELNT\_NBR) transfers.

In the use case, the size of the transfer is set at 4096 x 32 bits, chosen after performance benches.

With these considerations, the DMA register of channel  $i$  is configured as follows:

1. Channel source destination parameters: DMA4\_CSDPi
  - DMA4\_CSDPi[1:0] DATA\_TYPE = 0x2: Read 32-bit elements from the MMCHS\_DATA register.
  - DMA4\_CSDPi[5:2] RESERVED: Write 0s for future compatibility. Read returns 0.
  - DMA4\_CSDPi[6] SRC\_PACKED = 0x0: Cannot pack source data
  - DMA4\_CSDPi[8:7] SRC\_BURST\_EN = 0x0: Cannot burst source
  - DMA4\_CSDPi[12:9] RESERVED: Write 0s for future compatibility. Read returns 0.
  - DMA4\_CSDPi[13] DST\_PACKED = 0x0: No packing
  - DMA4\_CSDPi[15:14] DST\_BURST\_EN = 0x3: Burst at 16x32 bits

- DMA4\_CSDPi[17:16] WRITE\_MODE = 0x1: Write posted
  - DMA4\_CSDPi[18] DST\_ENDIAN\_LOCK = 0x0: Endianness adapt
  - DMA4\_CSDPi[19] DST\_ENDIAN = 0x0: Little Endian type at destination
  - DMA4\_CSDPi[20] SRC\_ENDIAN\_LOCK = 0x0: Endianness adapt
  - DMA4\_CSDPi[21] SRC\_ENDIAN = 0x0: Little endian type at source
  - DMA4\_CSDPi[31:22] RESERVED = 0x0: For future compatibility
2. Channel control register: DMA4\_CCRi
- DMA4\_CCRi[4:0] SYNCHRO\_CONTROL = DmaReq & 0x1F = 0x1E: 5 first bits of MMC1\_DMA\_RX(62)
  - DMA4\_CCRi[5] FS = 1: Packet mode with BS = 0x1
  - DMA4\_CCRi[6] READ\_PRIORITY = 0x0: Low priority on read side
  - DMA4\_CCRi[7] ENABLE = 0x0: The logical channel is disabled.
  - DMA4\_CCRi[8] SUSPEND\_SENSITIVE = 0
  - DMA4\_CCRi[9] RD\_ACTIVE: Read status, read-only access
  - DMA4\_CCRi[10] WR\_ACTIVE: Write status, read-only access
  - DMA4\_CCRi[11] RESERVED = 0: Write 0's for future compatibility.
  - DMA4\_CCRi[13:12] SRC\_AMODE = 0x0: Constant address mode; DMA always reads the MMCHS\_DATA.
  - DMA4\_CCRi[15:14] DST\_AMODE = 0x1: Post-incremented address mode
  - DMA4\_CCRi[16] CONST\_FILL\_ENABLE = 0x0: Constant fill mode is disabled.
  - DMA4\_CCRi[17] TRANSPARENT\_COPY\_ENABLE = 0x0: Transparent copy mode is disabled.
  - DMA4\_CCRi[18] BS = 0x1: Packet mode with FS = 0x1
  - DMA4\_CCRi[20:19] SYNCHRO\_CONTROL\_UPPER = 0x1: Two MSB of MMC1\_DMA\_RX(62)
  - DMA4\_CCRi[21] SECURE = 0x0: Channel secure mode is disabled.
  - DMA4\_CCRi[22] SUPERVISOR = 0x0: Supervisor mode is disabled.
  - DMA4\_CCRi[23] PREFETCH = 0x0: Prefetch mode is disabled; cannot prefetch a constant addressing source.
  - DMA4\_CCRi[24] SEL\_SRC\_DST\_SYNC = 0x1: Transfer is triggered by the source. The packet element number is specified in the DMA4\_CSFlI register.
  - DMA4\_CCRi[25] BUFFERING\_DISABLE = 0x0
  - DMA4\_CCRi[26] WRITE\_PRIORITY = 0x0: Channel has low priority on write side during the arbitration process.
  - DMA4\_CCRi[31:27] RESERVED = 0x0: Write 0's for future compatibility.
3. Channel parameters: DMA4\_CENi, DMA4\_CFNi, DMA4\_CSSAi, DMA4\_CDSAi, DMA4\_CSEli, DMA4\_CSFlI, DMA4\_CDEli
- DMA4\_CENi[23:0] CHANNEL\_ELMNT\_NBR = 4096: 4096 elements
  - DMA4\_CFNi[15:0] CHANNEL\_FRAME\_NBR = 1: One frame
  - DMA4\_CSSAi[31:0] SRC\_START\_ADRS = 0x4809c120: Channel source start address = MMCHS\_DATA
  - DMA4\_CDSAi[31:0] DST\_START\_ADRS= X: Channel destination start address in external DRAM
  - DMA4\_CSEli[31:0] CHANNEL\_SRC\_ELMNT\_INDEX = 1: Channel source element index
  - DMA4\_CSFlI[15:0] 16BIT\_PKT\_ELNT\_NBR = 0x200: Packet size = number odd data available in MMC after DMA req
  - DMA4\_CDEli[15:0] CHANNEL\_DST\_ELMNT\_INDEX = 0x1: Channel destination element Index
4. Interrupt management: DMA4\_CICRi and DMA4\_IRQENABLE\_Lj
- DMA4\_CICRi[31:0] = 0x00000008: Enables the end-of-frame interrupt and disables others (the value of these registers is unknown after a reset; it is necessary to clear other bits)
  - DMA4\_IRQENABLE\_L0[31:0] = 0xi: Interrupt of channel i is unmasked on IRQ line L0.
5. Launch transfer: DMA4\_CCRi[7] ENABLE = 0x1: Enables the channel

[Table 9-10](#) lists the DMA channel 2 registers after a first transfer.

**Table 9-10. Registers Print**

Register Name	Address	Value	Value Description
DMA4_IRQENABLE_L0	0x48056018	0x00000003	Interrupt of channel 2 is unmasked on IRQ line L0
DMA4_CICR2	0x48056148	0x00000008	End-of-frame interrupt enabled

**Table 9-10. Registers Print (continued)**

Register Name	Address	Value	Value Description
DMA4_CCR2	0x48056140	0x010c403e	Channel control register
DMA4_CSDP2	0x48056150	0x0001c003	Channel source destination parameters
DMA4_CEN2	0x48056154	0x00000080	Channel element number
DMA4_CFN2	0x48056158	0x00000001	Channel frame number
DMA4_CSSA2	0x4805615c	0x4809c120	Channel source start address
DMA4_CDSA2	0x48056160	0x8071aafc	Channel destination start address
DMA4_CSFli2	0x48056168	0x00000080	Packet size

DMA4_CCEN2	0x4805617c	0x00000080	Channel current transferred element number in the current frame (read only)
DMA4_CCFN12	0x48056180	0x00000000	Channel current transferred frame number in the current transfer (read only)
DMA4_CLNK_CTRL2	0x48056144	0x00000000	Channel link control register: No link

## 9.7 System Direct Memory Access (SDMA) Registers

This section provides a global view of the memory mapping as seen from the MPU for SDMA (also called DMA4). [Table 9-11](#) shows the DMA register base address.

**Table 9-11. Instance Summary**

Module Name	Base Address	Size
SDMA	0x4805 6000	4K bytes

### 9.7.1 DMA4 Controller Register Mapping Summary

[Table 9-12](#) lists all DMA4 controller registers and their physical addresses. [Table 9-13](#) through [Table 9-39](#) describe the individual register bits.

Index *i* represents the logical channel number (from 0 to 31 for SDMA and 23 for dDMA). The offset address for some registers is calculated from channel *c* number. For example, register SDMA.DMA4\_CCR10 (channel 10) has an offset address of  $10 \times 0x60 = 0x3C0$ , and so a physical address of  $0x4800 A080 + 0x3C0 = 0x4800 A440$ .

Index *j* represents the interrupt line number from 0 to 3. The offset address for some registers is calculated from channel *c* number. For example, register SDMA.DMA4\_IRQSTATUS\_L3 (line 3) has an offset address of  $3 \times 0x4 = 0xC$ , and so a physical address of  $0x4800 A008 + 0xC = 0x4800 A014$ .

**Table 9-12. SDMA Register Mapping Summary**

Register Name	Type	Register Width (Bits)	Address Offset	Physical Address	Section
DMA4_IRQSTATUS_Lj	RW	32	0x0000 0008 + (j * 0x4)	0x4805 6008 - 0x4805 6014	<a href="#">Section 14.5.7.18</a>

## 9.7.2 DMA4 Register Descriptions

This section describes the registers used in the DMA4 controller.

**NOTE:** Some registers have no reset value (marked with -) because of hardware implementation in memory. Software must ensure the correct programming of these registers, if needed.

The shadow registers are used to read run time registers like CCEN, CCFN, CDAC, or CSAC. Typically, when accessed in 8-bit or 16-bit access for two consecutive access the value of the previous registers may change. This shadow register is used to hold the whole value to allow the next access recover the remaining 24-bit or 16-bit.

The CSAC, CDAC, CCEN, and CCFN registers must be written or read in a way that enables the LSByte; otherwise, the shadow registers do not update the register.

There is no issue for 32-bit read-write transactions. For 16-bit transactions, read or write the LSByte first to enable the register update.

Table 9-13 through Table 9-39 describe the DMA register bits.

### 9.7.2.1 DMA4\_IRQSTATUS\_Lj

**Table 9-13. DMA4\_IRQSTATUS\_Lj**

<b>Address Offset</b>	0x0000 0008	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 6008 + (j * 0x4)		
<b>Description</b>	The interrupt status register regroups all the status of the DMA4 channels that can generate an interrupt over line Lj.		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH_31_0_Lj																															

Bits	Field Name	Description	Type	Reset
31:0	CH_31_0_Lj	Channel 31 Interrupt on Lj: When an interrupt is seen on the line Lj the status of a interrupting channel i is read in the bitfield i.  0x0: Channel Interrupt Lj false 0x0: Channel Interrupt Lj status bit unchanged 0x1: Channel Interrupt Lj true (pending) 0x1: Channel Interrupt Lj status bit is reset	RW	0x00000000

### 9.7.2.2 DMA4\_IRQENABLE\_Lj

**Table 9-14. DMA4\_IRQENABLE\_Lj**

<b>Address Offset</b>	0x0000 0018	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 6018 + (j * 0x4)		
<b>Description</b>	The interrupt enable register allows to mask/unmask the module internal sources of interrupt, on line Lj		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH_31_0_Lj_EN																															

Bits	Field Name	Description	Type	Reset
31:0	CH_31_0_Lj_EN	Channel Interrupt on Lj mask/unmask : to Mask/Unmask a channel i interrupt on Lj the user writes 0/1 on the bitfield i.  0x0: Channel Interrupt Lj is masked 0x1: Channel Interrupt Lj generates an interrupt when it occurs	RW	0x00000000

### 9.7.2.3 DMA4\_SYSSTATUS

**Table 9-15. DMA4\_SYSSTATUS**

<b>Address Offset</b>	0x0000 0028	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 6028		
<b>Description</b>	The register provides status information about the module excluding the interrupt status information (see interrupt status register)		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															RESETDONE

Bits	Field Name	Description	Type	Reset
31:1	RESERVED	Reserved for module-specific status information	RW	0x00000000
0	RESETDONE	Internal reset monitoring  0x0: Internal module reset is on-going 0x1: Reset completed	R	0x-

**9.7.2.4 DMA4\_OCP\_SYSCONFIG**
**Table 9-16. DMA4\_OCP\_SYSCONFIG**

<b>Address Offset</b>	0x0000 002C	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 602C		
<b>Description</b>	This register controls the various parameters of the OCP interface		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																MIDLEMODE		RESERVED		CLOCKACTIVITY		RESERVED		EMUFREE	SIDLEMODE		RESERVED	SOFTRESET	AUTOIDLE		

Bits	Field Name	Description	Type	Reset
31:14	RESERVED	Write 0's for future compatibility, Reads return 0	RW	0x00000
13:12	MIDLEMODE	Read write power management, standby/wait control 0x0: Force-standby: MStandby is asserted only when all the DMA channels are disabled 0x1: No-Standby: MStandby is never asserted 0x2: Smart-Standby: MStandby is asserted if at least one of the following two conditions is satisfied: 1. All the channels are disabled 2. There is no nonsynchronized channel enabled and or no DMA request input is asserted and no request in the read and write port scheduler state machine. 0x3: reserved for second smart-standby mode if needed	RW	0x0
11:10	RESERVED	Reserved for clocks activities extension	RW	0x0
9:8	CLOCKACTIVITY	Clocks activities during wake-up Bit 8: OCP interface clock 0 OCP clock can be switched-off Bit 9: Functional clock 0 Functional clock can be switched-off	R	0x0
7:6	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x0
5	EMUFREE	Enable sensitivity to MSuspend 0x0: DMA4 freezes its internal logic upon MSuspend assertion 0x1: DMA4 ignores the MSuspend input	RW	0x0
4:3	SIDLEMODE	Configuration port power management, Idle req/ack control 0x0: Force-idle. An idle request is acknowledged unconditionally 0x1: No-idle. An idle request is never acknowledged 0x2: Smart-idle. Acknowledgment to an idle request is given 0x3: reserved - do not use based on the internal activity of the module	RW	0x0
2	RESERVED	Write 0's for future compatibility, Reads return 0	RW	0x0
1	SOFTRESET	Software reset. Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware. During reads, it always returns 0. 0x0: No effect 0x1: Reset	RW	0x0

Bits	Field Name	Description	Type	Reset
0	AUTOIDLE	Internal OCP clock gating strategy 0x0: OCP clock is free running 0x1: Automatic OCP clock gating strategy is applied, based on the OCP interface activity.	RW	0x0

### 9.7.2.5 DMA4\_CAPS\_0

**Table 9-17. DMA4\_CAPS\_0**

<b>Address Offset</b>	0x0000 0064	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 6064		
<b>Description</b>	DMA Capabilities Register 0 LSW		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CONST_FILL_CPBLTY		TRANSPARENT_BLT_CPBLTY		RESERVED																			

Bits	Field Name	Description	Type	Reset
31:20	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x000
19	CONST_FILL_CPBLTY	Constant_Fill_Capability 0x0: No LCH supports constant fill copy 0x1: any LCH supports constant fill copy	R	0x1
18	TRANSPARENT_BLT_CPBLTY	Transparent_BLT_Capability 0x0: No LCH supports transparent BLT copy 0x1: any LCH supports transparent BLT copy	R	0x1
17:0	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x00000

**9.7.2.6 DMA4\_CAPS\_2**
**Table 9-18. DMA4\_CAPS\_2**

<b>Address Offset</b>	0x0000 006C	<b>Instance</b>	SDMA
<b>Physical Address</b>	0x4805 606C		
<b>Description</b>	DMA Capabilities Register 2		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																SEPARATE_SRC_AND_DST_INDEX_CPBLTY DST_DOUBLE_INDEX_ADRS_CPBLTY DST_SINGLE_INDEX_ADRS_CPBLTY DST_POST_INCRMNT_ADRS_CPBLTY DST_CONST_ADRS_CPBLTY SRC_DOUBLE_INDEX_ADRS_CPBLTY SRC_SINGLE_INDEX_ADRS_CPBLTY SRC_POST_INCREMENT_ADRS_CPBLTY SRC_CONST_ADRS_CPBLTY															

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x000000
8	SEPARATE_SRC_AND_DST_INDEX_CPBLTY	Separate_source/destination_index_capability 0x0: Does not support separate src/dst index for 2D addressing 0x1: Supports separate src/dest index for 2D addressing	R	0x1
7	DST_DOUBLE_INDEX_ADRS_CPBLTY	Destination_double_index_address_capability 0x0: Does not support double index address mode on the destination port 0x1: Supports double index address mode on the destination port	R	0x1
6	DST_SINGLE_INDEX_ADRS_CPBLTY	Destination_single_index_address_capability 0x0: Does not support single index address mode on the destination port 0x1: Supports single index address mode on the destination port	R	0x1
5	DST_POST_INCRMNT_ADRS_CPBLTY	Destination_post_increment_address_capability 0x0: Does not supports post-increment address mode in the destination port 0x1: Supports post-increment address mode in the destination port	R	0x1
4	DST_CONST_ADRS_CPBLTY	Destination_constant_address_capability 0x0: Does not supports constant address mode in the destination port 0x1: Supports constant address mode in the destination port	R	0x1
3	SRC_DOUBLE_INDEX_ADRS_CPBLTY	Source_double_index_address_capability 0x0: Does not support double index address mode on the source port 0x1: Supports double index address mode on the source port	R	0x1

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
2	SRC_SINGLE_INDEX_ADRS_CPBLTY	Source_single_index_address_capability 0x0: Does not support single index address mode on the source port 0x1: Supports single index address mode in the source port	R	0x1
1	SRC_POST_INCREMENT_ADRS_CPBLTY	Source_post_increment_address_capability 0x0: Does not supports post-increment address mode in the source port 0x1: Supports post-increment address mode in the source port	R	0x1
0	SRC_CONST_ADRS_CPBLTY	Source_constant_address_capability 0x0: Does not supports constant address mode in the source port 0x1: Supports constant address mode in the source port	R	0x1

**9.7.2.7 DMA4\_CAPS\_3**
**Table 9-19. DMA4\_CAPS\_3**

<b>Address Offset</b>	0x0000 0070	<b>Instance</b>	SDMA

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x000000
7	PKT_INTERRUPT_CPBLTY	End of Packet detection capability. 0x0: Does not support end of packet interrupt generation capability 0x1: Supports end of packet interrupt generation capability	R	0x1
6	SYNC_STATUS_CPBLTY	Sync_status_capability 0x0: Does not support synchronized transfer status bit generation 0x1: Supports synchronized transfer status bit generation	R	0x1
5	BLOCK_INTERRUPT_CPBLTY	End of block detection capability. 0x0: Does not support end of block interrupt generation capability 0x1: Supports end of block interrupt generation capability	R	0x1
4	LAST_FRAME_INTERRUPT_CPBLTY	Start of last frame detection capability. 0x0: Does not support last frame interrupt generation capability 0x1: Supports last frame interrupt generation capability	R	0x1
3	FRAME_INTERRUPT_CPBLTY	End of frame detection capability. 0x0: Does not support end of frame interrupt generation capability 0x1: Supports end of frame interrupt generation capability	R	0x1
2	HALF_FRAME_INTERRUPT_CPBLTY	Detection capability of the half of frame end. 0x0: Does not support half of frame interrupt generation capability 0x1: Supports half of frame interrupt generation capability	R	0x1

**System Direct Memory Access (SDMA) Registers**
[www.ti.com](http://www.ti.com)

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
1	EVENT_DROP_INTERRUPT_CPBLTY	Request collision detection capability. 0x0: Does not support event drop interrupt generation capability 0x1: Supports event drop interrupt generation capability	R	0x1
0	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x0

**9.7.2.9 DMA4\_GCR**
**Table 9-21. DMA4\_GCR**

<b>Address Offset</b>	0x0000 0078
<b>Physical Address</b>	0x4805 6078
<b>Description</b>	FIFO sharing between high and low priority channel. The Maximum per channel FIFO depth is bounded by the low and high channel FIFO budget. The high respectively low priority channels maximum burst size must be less than the min (high respectively low priority channel FIFO budget , per channel maximum FIFO depth)
<b>Type</b>	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								ARBITRATION_RATE								HI_LO_FIFO_BUDGET		HI_THREAD_RESERVED		RESERVED				MAX_CHANNEL_FIFO_DEPTH							

Bits	Field Name	Description	Type	Reset
31:24	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x00
23:16	ARBITRATION_RATE	Arbitration switching rate between prioritized and regular channel queues	RW	0x01
15:14	HI_LO_FIFO_BUDGET	Allow to have a separate Global FIFO budget for high and low priority channels. For Hi priority Channel: (Per_channel_Maximum FIFO depth + 1) x Number of active High priority Channel =< High Budget FIFO For Low priority channel: (Per_channel_Maximum FIFO depth + 1) x Number of active Low priority Channel =< Low Budget FIFO  0x0: no fixed budget for neither higher nor lower priority channel  0x1: 75% of FIFO for low priority and 25% for high priority channels  0x2: 25% of FIFO for low priority and 75% for high priority channels  0x3: 50% of FIFO for low priority and 50% for high priority channels	RW	0x0
13:12	HI_THREAD_RESERVED	Allow thread reservation for high priority channel on both read and write ports.  0x0: No ThreadID is reserved on the Read Port for high priority channels. No ThreadID is reserved on the Write Port for high priority channels.  0x1: Read Port ThreadID 0 is reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.  0x2: Read port ThreadID 0 and ThreadID 1 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.  0x3: Read Port ThreadID 0, ThreadID 1 and ThreadID 2 are reserved for high priority channels. Write Port ThreadID 0 is reserved for high priority channels.	RW	0x0

<b>Bits</b>	<b>Field Name</b>	<b>Description</b>	<b>Type</b>	<b>Reset</b>
11:8	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x0
7:0	MAX_CHANNEL_FIFO_DEPTH	Maximum FIFO depth allocated to one logical channel. Maximum FIFO depth can not be 0x0. It should be at least 0x1 or greater. Note that If channel limit is less than destination burst size enough data will not be accumulated in the data FIFO and it will never be sent out on the WR port. The burst size should be less than the FIFO limit specified in this bitfield.	RW	0x10

**9.7.2.10 DMA4\_CCRi**
**Table 9-22. DMA4\_CCRi**

<b>Address Offset</b>	0x0000 0080 - 0x0000 0C20 in 0x60 byte increments		
<b>Physical Address</b>	0x4805 6080	<b>Instance</b>	SDMA
<b>Description</b>	Channel Control Register		
<b>Type</b>	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								WRITE_PRIORITY	BUFFERING_DISABLE	SEL_SRC_DST_SYNC	PREFETCH	SUPERVISOR	SECURE	SYNCHRO_CONTROL_UPPER	BS	TRANSPARENT_COPY_ENABLE	CONST_FILL_ENABLE	DST_AMODE	SRC_AMODE	RESERVED	WR_ACTIVE	RD_ACTIVE	SUSPEND_SENSITIVE	ENABLE	READ_PRIORITY	FS	SYNCHRO_CONTROL				

Bits	Field Name	Description	Type	Reset
31:27	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x00
26	WRITE_PRIORITY	Channel priority on the Write side  0x0: Channel has low priority on the Write side during the arbitration process 0x1: Channel has high priority on Write sided during the arbitration process	RW	0x0
25	BUFFERING_DISABLE	This bit allows to disable the default buffering functionality when transfer is source synchronized.  0x0: buffering is enable across element/packet when source is synchronized to element, packet, frame or blocks 0x1: buffering is disabled across element/packet when source is synchronized to element, packet, frame or blocks	RW	0x-
24	SEL_SRC_DST_SYNC	Specifies that element, packet, frame or block transfer (depending on CCR.bs and CCR.fs) is triggered by the source or the destination on the DMA request  0x0: Transfer is triggered by the destination. If synch on packet the packet element number is specified in the CDFI register 0x1: Transfer is triggered by the source. If synchronized on packet the packet element number is specified in the CSFI register	RW	0x-
23	PREFETCH	Enables the prefetch mode  0x0: Prefetch mode is disabled. When Sel_Src_Dst_Sync=1 transfers are buffered and pipelined between DMA requests 0x1: Prefetch mode is enabled. Prefetch mode is active only when destination is synchronized. It is SW user responsibility not to have at the same time Prefetch=1 when Sel_Src_Dst_Sync=1. This mode is not supported	RW	0x-

Bits	Field Name	Description	Type	Reset
22	SUPERVISOR	Enables the supervisor mode 0x0: Supervisor mode is disabled 0x1: Supervisor mode is enabled	RW	0x0
21	SECURE	Enables or disables a secure transaction over the channel 0x0: Channel secure mode is disabled 0x1: Channel secure mode is enabled	RW	0x0
20:19	SYNCHRO_CONTROL_UPPER	Channel Synchronization control upper (used in conjunction with the 5 bits of synchro channel DMA4_CCRi[4:0]) Used in conjunction, as two msb, with the five bits of the synchro channel bitfield.	RW	0x-
18	BS	Block synchronization This bit used in conjunction with the FS to see how the DMA request is serviced in a synchronized transfer	RW	0x-
17	TRANSPARENT_COPY_ENABLE	Transparent copy enable 0x0: Transparent copy mode is disabled 0x1: Transparent copy mode is enabled	RW	0x-
16	CONST_FILL_ENABLE	Constant fill enable 0x0: Constant fill mode is disabled 0x1: Constant fill mode is enabled	RW	0x-
15:14	DST_AMODE	Selects the addressing mode on the Write Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode	RW	0x-
13:12	SRC_AMODE	Selects the addressing mode on the Read Port of a channel. 0x0: Constant address mode 0x1: Post-incremented address mode 0x2: Single index address mode 0x3: Double index address mode	RW	0x-
11	RESERVED	Reserved, Write 0's for future compatibility, Read returns 0	RW	0x0
10	WR_ACTIVE	Indicates if the channel write context is active or not 0x0: Channel is not active on the write port 0x1: Channel is currently active on the write port	R	0x-
9	RD_ACTIVE	Indicates if the channel read context is active or not 0x0: Channel is not active on the read port 0x1: Channel is currently active on the read port	R	0x-
8	SUSPEND_SENSITIVE	Logical channel suspend enable bit 0x0: The channel ignores the MSuspend even if EMUFree is set to 0. 0x1: If EMUFree is set to 0 and MSuspend comes in then all current OCP services (single transaction or burst transaction as specified in the corresponding CSDP register) have to be completed before stopping processing any more transactions	RW	0x-
7	ENABLE	Logical channel enable. It is SW responsibility to clear the CSR register and the IRQSTATUS bit for the different interrupt lines before enabling the channel. 0x0: The logical channel is disabled 0x1: The logical channel is enabled	RW	0x0

Bits	Field Name	Description	Type	Reset
6	READ_PRIORITY	Channel priority on the read side 0x0: Channel has low priority on the Read side during the arbitration process 0x1: Channel has high priority on read sided during the arbitration process	RW	0x-
5	FS	Frame synchronization This bit used in conjunction with the BS to see how the DMA request is serviced in a synchronized transfer FS=0 and BS=0: An element is transferred once a DMA request is made. FS=0 and BS=1: An entire block is transferred once a DMA request is made. FS=1 and BS=0: An entire frame is transferred once a DMA request is made. FS=1 and BS=1: A packet is transferred once a DMA request is made. All these different transfers can be interleaved on the port with other DMA requests.	RW	0x-
4:0	SYNCHRO_CONTROL	Channel synchronization control This bitfield used in conjunction with the second_level_synchro_control_upper (as two msb) 0000000 : Is reserved for non synchronized LCH transfer xxxxxx (from 1 to 127)There are 127 possible DMA request to assign to any LCH. <b>Note:</b> The channel synchronization control registers are 1-based. For example, to enable the S_DMA_1 request, SDMA.DMA4_CCR[4:0] SYNCHRO_CONTROL must be set to 0x2 (DMA request number + 1).	RW	0x--

**9.7.2.11 DMA4\_CLNK\_CTRLi**

## ***Interrupt Controller (INTC)***

---

---

This chapter gives an overview of the interrupt controllers (INTCs) and describes in detail the MPU subsystem interrupt controller (MPU\_INTC) module used in the stand-alone processor.

---

**NOTE:** This chapter gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. Ensure that interrupts of unavailable modules and features are masked in MPU/IVA subsystems .

## 10.1 Interrupt Controller Overview

The device provides two interrupt controller (INTC) modules:

- **MPU subsystem INTC (INTCPS):** This module handles all MPU-related events, using Priority Threshold and Security Features. It communicates with the ARM Cortex-A8™ processor using a private local interconnect, and runs at half the speed of the processor.
- **IVA2.2 subsystem INTC:** This module is a specific combination of WUGEN (wake-up generator) and the GEM Joule DSP megamodule interrupt controller (IC). It is used in the device, but is not described in detail in this chapter. For detailed information about this INTC, see *IVA2.2 Subsystem* chapter.

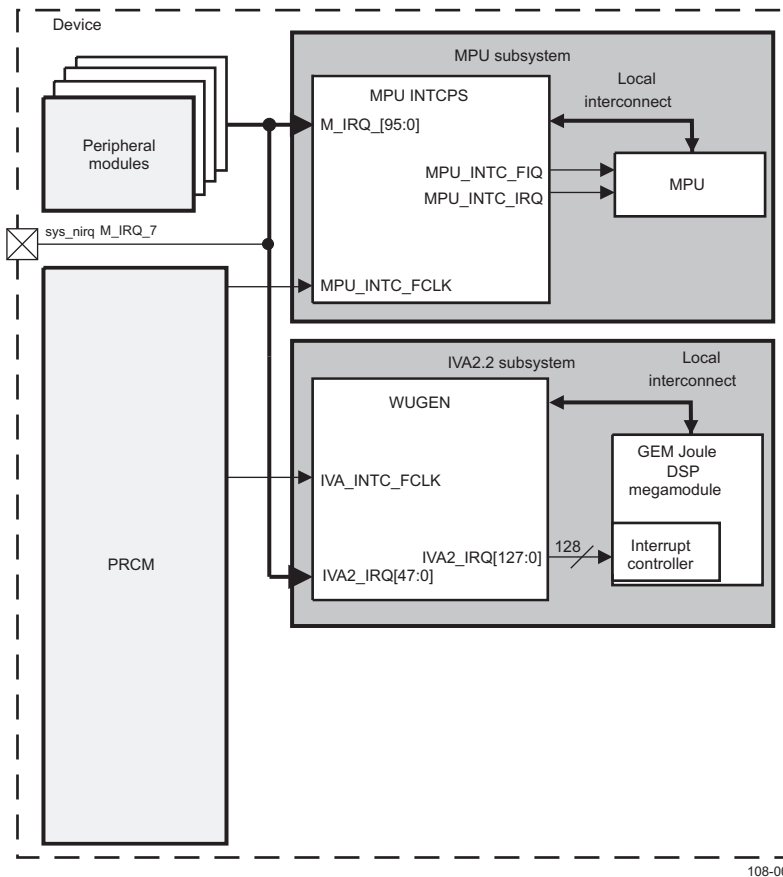

---

**NOTE:** Some features may not be available or supported in your particular device. For more information, see Chapter 1, the *Device Family* section, and your device-specific data manual.

---

Figure 10-1 shows the internal interrupt scheme.

**Figure 10-1. Interrupt Controllers Highlight**

## 10.2 Interrupt Controller Environment

The INTC can handle two types of interrupts originating from an external device:

- sys\_nirq interrupt inputs:

The MPU INTC handles external interrupts through a dedicated sys\_nirq interrupt line that connects the INTC module with a TPS65950 power IC. An interrupt can generate a system wake-up event.

If the system is idle and the external interrupt is masked, the interrupt cannot wake up the system. Like other interrupt lines, the external interrupt is active at low level and is acknowledged by the software according to the common programming model.

---

**NOTE:** If the CORE power domain is in retention (CSWR or OSWR) or off mode, both the interrupt requests (internal or external) and the MPU INTC have no effect. The CORE power domain does not wake up, and the interrupt is not signaled to the MPU.

---

- GPIO interrupt inputs:

External devices can also use GPIO modules to generate interrupts to the MPU. There are six dedicated interrupt lines to the MPU INTC. One interrupt line is associated with each GPIO module. Each GPIO module can generate a single interrupt whenever there is at least one event in any one of the configured 32 GPIO inputs. For more information about GPIO features, see the *General-Purpose Interface* chapter.

Figure 10-2 shows the relationship between the device and external interrupts.

**Figure 10-2. Interrupts from External Devices**

The features specific to INTCPs are:

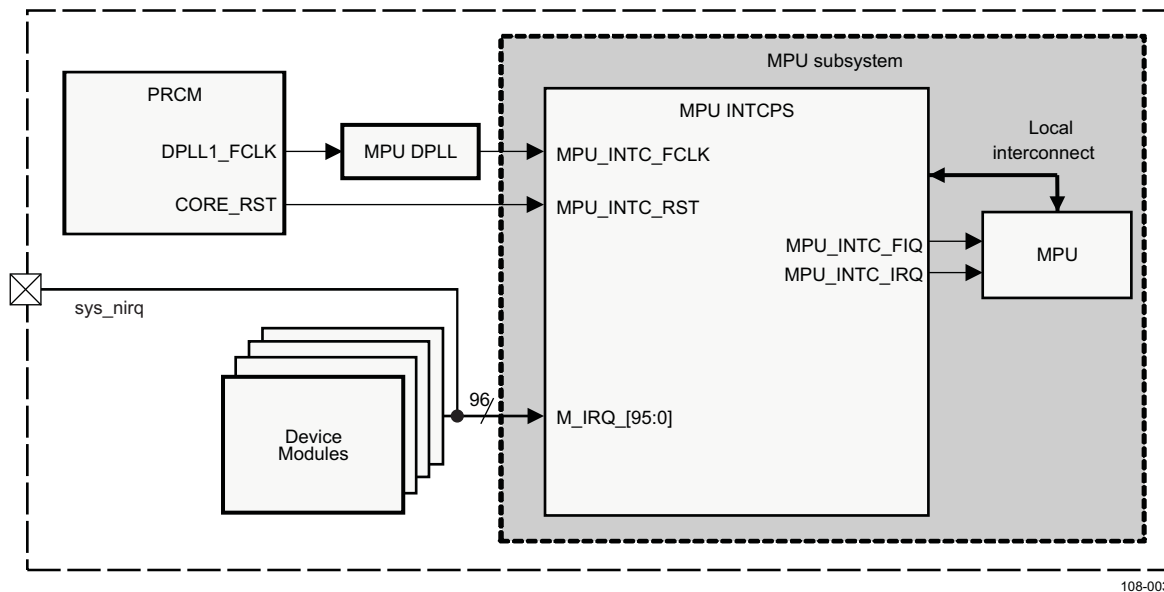

- Up to 96 level-sensitive interrupt inputs
- Individual priority (up to 64) for each interrupt input
- Interrupt lines connected to internal module interrupts
- One incoming interrupt line from an external device

## 10.3 MPU Subsystem INTCPS Integration

The INTCPS module is the interface between incoming interrupts and the two interrupt inputs of the MPU. It can handle up to 96 request inputs that can be configured as MPU FIQ or IRQ interrupt requests.

Figure 10-3 shows the integration of the INTCPS in the MPU subsystem.

**Figure 10-3. MPU Subsystem INTCPS Integration**

The MPU subsystem INTCPS is directly connected to the MPU by an MPU peripheral port. Consequently, the MPU subsystem INTCPS is accessible and visible only by the MPU.

### 10.3.1 Clocking, Reset, and Power Management Scheme

#### 10.3.1.1 MPU Subsystem INTC Clocks

The MPU subsystem INTCPS runs at half the rate of the MPU functional clock (see the *MPU Subsystem* chapter).

The interface clock used for register access runs at the rate of the interconnect bus clock (equal to the rate of the MPU interface clock; see the *Power, Reset, and Clock Management* chapter).

The synchronizer clock allows external asynchronous interrupts to be resynchronized before they are masked.

Table 10-1 lists the MPU subsystem INTC clock rates.

**Table 10-1. MPU Subsystem INTC Clock Rates**

Clock	Frequency	Name	Comments
Functional	ARM_FCLK	MPU_INTC_FCLK	Source is the MPU DPLL.
Interface	ARM_FCLK	MPU_INTC_ICLK	Source is the PRCM module.
Synchronizer	MPU_INTC_FCLK	Synchronizer clock (module internal clock)	Source is the MPU_INTC_FCLK.

#### 10.3.1.2 Hardware and Software Reset

Table 10-2 lists the MPU subsystem INTC resets.

**Table 10-2. Hardware and Software Reset**

Type	Name	Source	Activation	Domain
Hardware	CORE_RST	PRCM	Active low	CORE
Software	SOFTRESET	MPU_INTC.INTCPS_SYSCONFIG[1] SOFTRESET bit	Active at 1	MPU INTC internal

### 10.3.1.3 Power Management

The MPU subsystem INTC belongs to the CORE power domain. As part of CORE power domain, it is sensitive to a CORE\_RST issued by the PRCM. For more information about the CORE power domain implementation and CORE\_RST signal, see the *Power, Reset, and Clock Management* chapter.

The MPU INTC clocks come from the MPU DPLL. For more information about these clocks control, see the *MPU Subsystem* chapter.

## 10.3.2 Interrupt Request Lines

Table 10-3 lists the incoming and outgoing interrupt lines of the INTCPS.

**Table 10-3. Interrupt Lines Incoming and Outgoing**

Type	Number	Name	Mapping	Comments
Interrupt request inputs	Up to 96	M_IRQ_[95:0]	See Table 10-4	Inputs to INTCPS module, source from various modules.
Interrupt request outputs	2	MPU_INTC_FIQ	MPU_INTC_FIQ	Outgoing to MPU Fast Interrupt
		MPU_INTC_IRQ	MPU_INTC_IRQ	Outgoing to MPU Normal Interrupt

**NOTE:** Interrupt request signals are active at low level.

### CAUTION

A single interrupt source can be physically mapped to multiple INTCs (MPU subsystem, IVA2.2 subsystem). With multiple-mapped interrupts, it is strongly recommended each interrupt source be unmasked in only one INTC at a time.

This section gives information about all modules and features in the high-tier device. See Chapter 1, *Device Family* section, to check availability of modules and features. Ensure that interrupts of unavailable modules and features are masked in MPU subsystem.

Table 10-4 lists interrupt mappings to the MPU subsystem.

**Table 10-4. Interrupt Mapping to the MPU Subsystem<sup>(1)</sup>**

IRQ	Source	Description
M_IRQ_0	EMUINT	MPU emulation <sup>(2)</sup>
M_IRQ_1	COMMTX	MPU emulation <sup>(2)</sup>
M_IRQ_2	COMMRX	MPU emulation <sup>(2)</sup>
M_IRQ_3	BENCH	MPU emulation <sup>(2)</sup>
M_IRQ_4	MCBSP2_ST_IRQ	Sidetone MCBSP2 overflow
M_IRQ_5	MCBSP3_ST_IRQ	Sidetone MCBSP3 overflow
M_IRQ_6	Reserved	Reserved
M_IRQ_7	sys_nirq	External source (active low)
M_IRQ_8	Reserved	Reserved

<sup>(1)</sup> All the IRQ signals are active at low level.

<sup>(2)</sup> These interrupts are internally generated within the MPU subsystem.

**Table 10-4. Interrupt Mapping to the MPU Subsystem<sup>(1)</sup> (continued)**

IRQ	Source	Description
M_IRQ_9	SMX_DBG_IRQ	L3 Interconnect error for debug
M_IRQ_10	SMX_APP_IRQ	L3 Interconnect error for application
M_IRQ_11	PRCM_MPU_IRQ	PRCM module IRQ

M_IRQ_95	Reserved	Reserved

## 10.4 Interrupt Controller Functional Description

The main features of the INTCPS are:

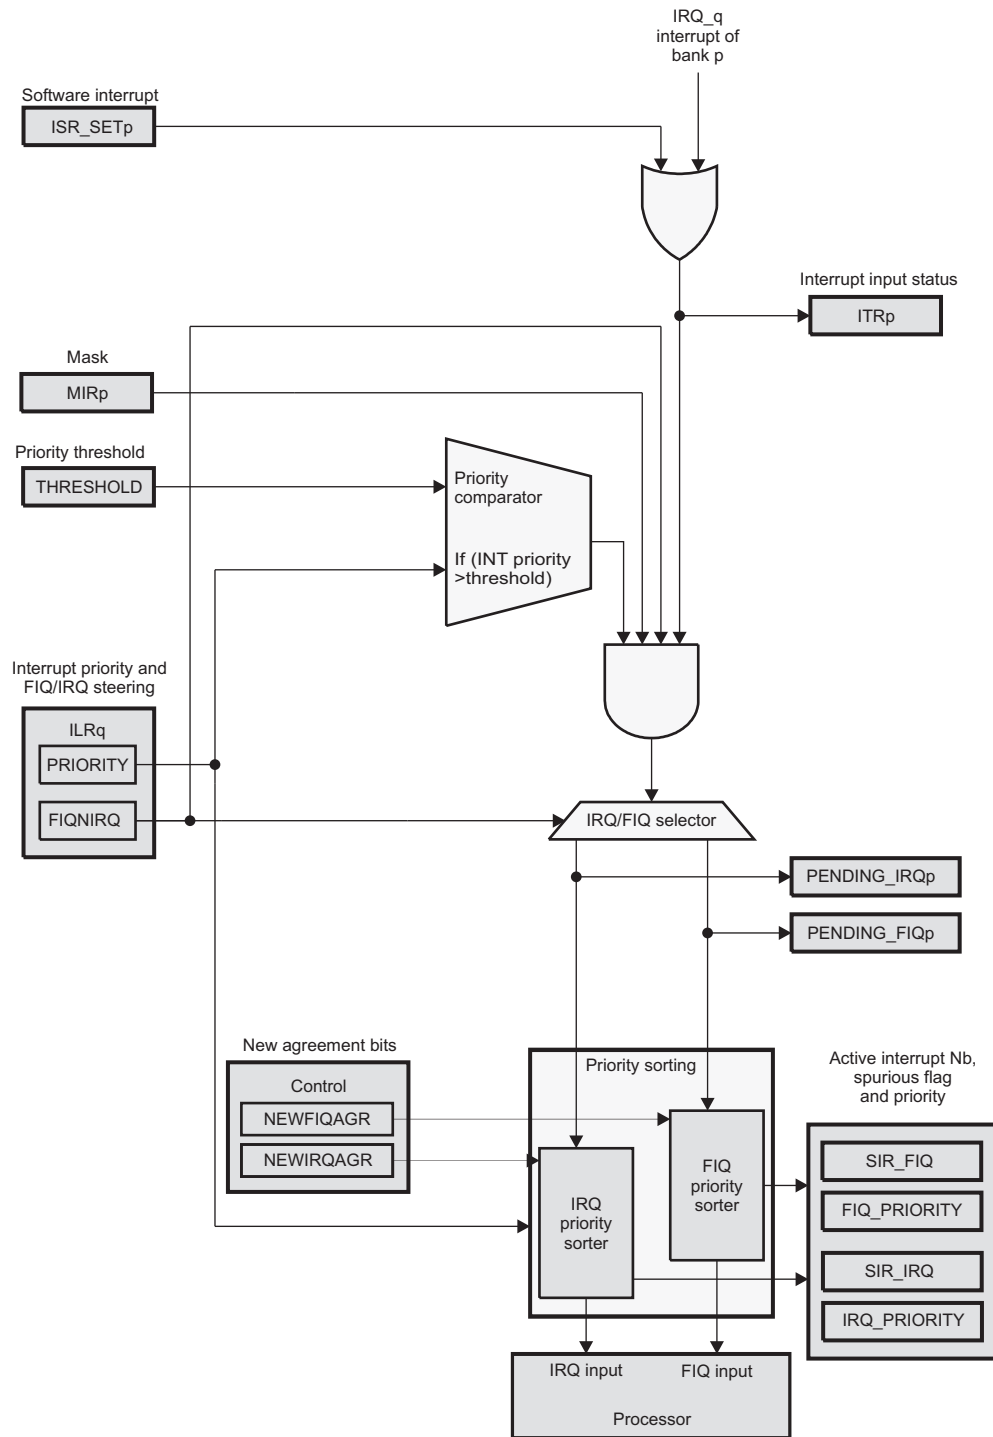

- Individual priority (up to 64 levels) for each interrupt input
- Ability for each interrupt to be steered to either FIQ or IRQ

- Independent priority sorting for FIQ and IRQ; FIQ sorting is processed concurrently with IRQ sorting.
- Priority masking: Interrupts can be masked based on the priority threshold register.
- Atomic bit set and clear capability for interrupt mask and software interrupt registers
- For high-security (HS) devices only:
  - Global interrupt mask
  - Protection for secure interrupts
- Power-management and wake-up support
- Auto-idle power-saving support

The INTCPS processes incoming interrupts by masking and priority sorting, then it generates the interrupt requests to the MPU.

[Figure 10-4](#) shows the top-level view of the interrupt processing.

Figure 10-4. Top-Level Block Diagram

intc-004

- (1) Public Mask = SICR[3] PUBLICINHIBIT bit OR (SICR[2] AUTOINHIBIT bit AND SICR[0] SSMFIQSTATUS bit)
- (2) The SCR<sub>n</sub> forces the interrupt priority to 0 (highest).
- (3) The SCR<sub>n</sub> forces the interrupt to FIQ.
- (4) The comparator output is TRUE only if the interrupt priority is higher than the threshold register priority. The highest priority is 0x0; the lowest priority is 0x3F (63).

## 10.4.1 Interrupt Processing

### 10.4.1.1 Input Selection

The INTCPS supports only level-sensitive incoming interrupt detection. A peripheral asserting an interrupt maintains it until software has handled the interrupt and instructed the peripheral to de-assert the interrupt.

A software interrupt is generated if the corresponding bit in the MPU\_INTC.INTCPS\_ISR\_SETn register is set (register bank number: n = [0,2] for the MPU subsystem INTCPS, 96 incoming interrupt lines are supported). The software interrupt clears when the corresponding bit in the MPU\_INTC.INTCPS\_ISR\_CLEARn register is written. Typical use of this feature is software debugging.

### 10.4.1.2 Masking

#### 10.4.1.2.1 Individual Masking

Detection of interrupts on each incoming interrupt line can be enabled or disabled independently by the MPU\_INTC.INTCPS\_MIRn interrupt mask register. In response to an unmasked incoming interrupt, the INTCPS can generate one of two types of interrupt requests to the processor:

- IRQ: low-priority interrupt request
- FIQ: fast interrupt request

The type of interrupt request is determined by the MPU\_INTC.INTCPS\_ILRm[0] FIQNIRQ bit (m= [0,95]).

The current incoming interrupt status before masking is readable from the MPU\_INTC.INTCPS\_ITRn register. After masking and IRQ/FIQ selection, and before priority sorting is done, the interrupt status is readable from the MPU\_INTC.INTCPS\_PENDING\_IRQn and MPU\_INTC.INTCPS\_PENDING\_FIQn registers.

#### 10.4.1.2.2 Global Masking (HS Devices Only)

Software may use global masking for security purposes, but this feature must be used with care. To determine if a HS version of your device is available and for more information on HS devices, please refer to your device-specific data manual.

#### 10.4.1.2.3 Priority Masking
